No. 7895

When, from whom, and how this volume was obtained, with the price paid, if any, may be found opposite the above number in the Register of Books, which is always open to inspection.

Extract from the Political Code.

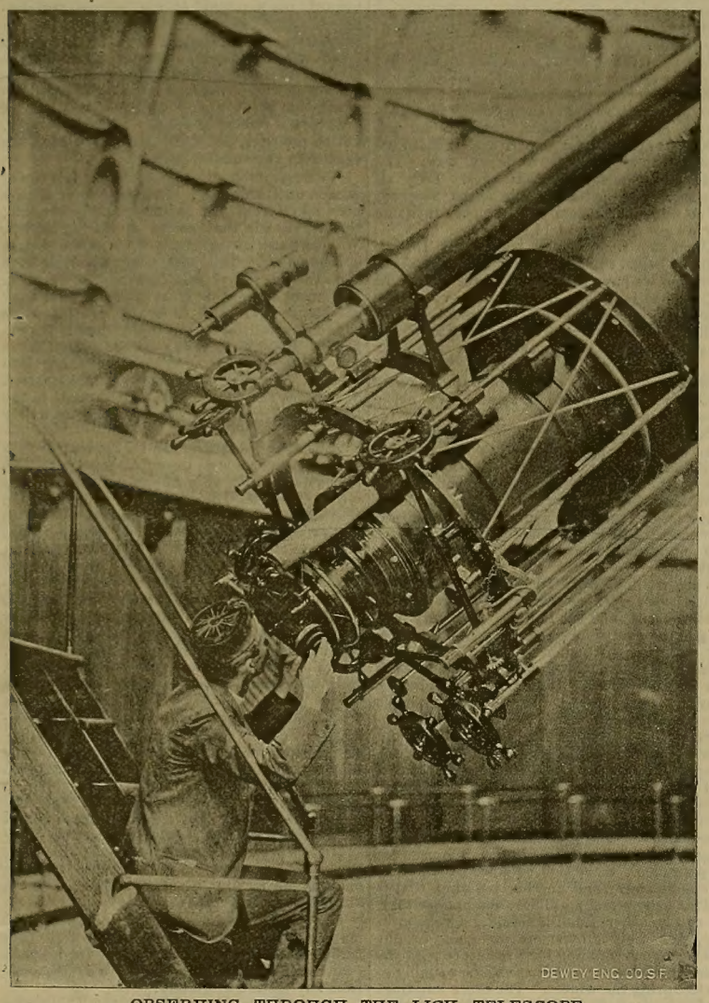
SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298 The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

☞The foregoing Regulations will be strictly enforced.☜



INV. 1898. C

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

78895 TWENTY-PAGE EDITION.

VOL. LIX.—Number 1. DEWEY & CO., PUBLISHERS. SAN FRANCISCO, SATURDAY, JULY 6, 1889. Three Dollars per Annum Single Copies, 10 Cts.

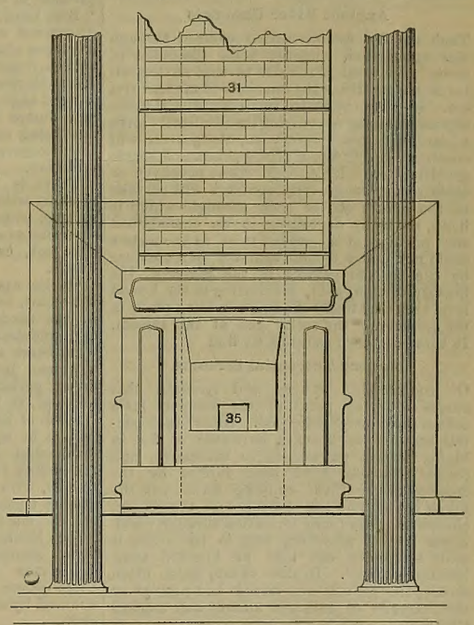
OBSERVING THROUGH THE LICK TELESCOPE.

The Lick Telescope.

On this page is given a photo-facsimile of the eye end of the great 36-inch Lick telescope at the Mount Hamilton Observatory. Some idea is given of the complicated mechanism by which the glassis controlled, it being so arranged as to be under the com plete control of the observer. Moreover, one may see from this picture the great size of the telescope—comparing the figure of the man with that portion of the instrument in view.

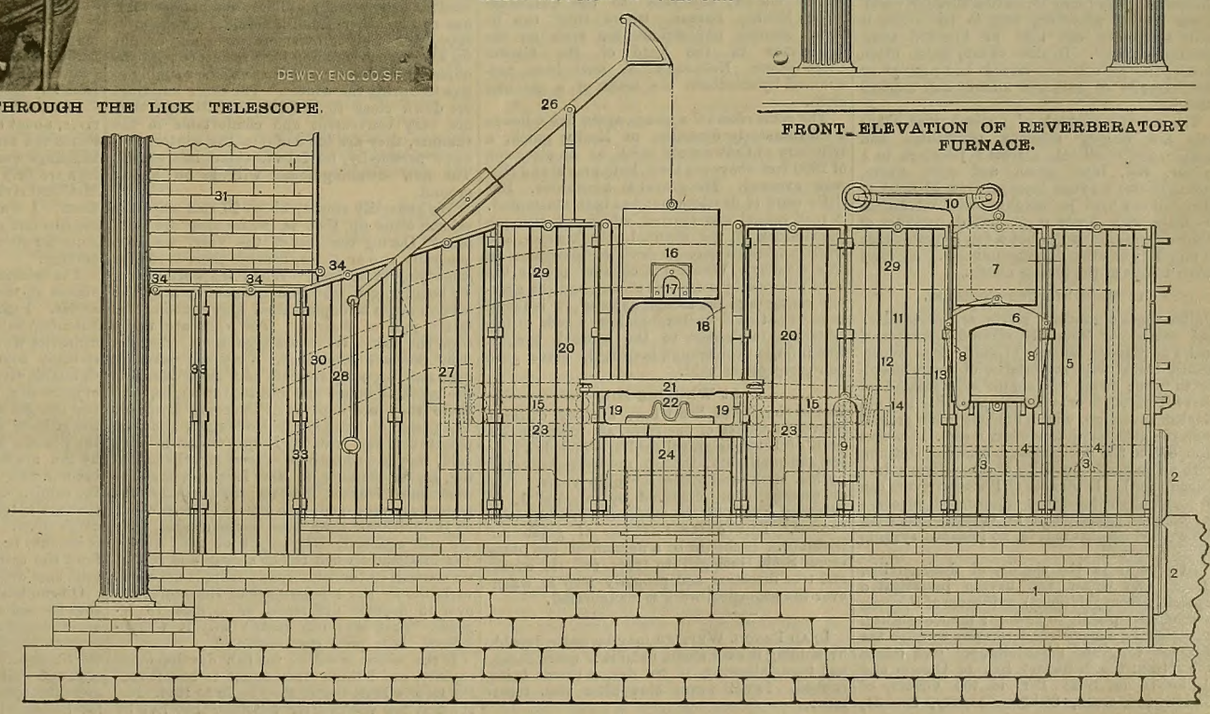
This picture was made direct from a photograph without redrawing, so that it is a perfect reproduction, showing the eye end of the glass without distortion or change of any kind. This is a valuable feature in representing things of this nature, since there are no "fancy touches" or changes possible by the artist.

We have, in the PRESS of June 23, 1888, given a description of the Lick telescope and observatory, with engravings; so it is unnecessary to refer at this time to any details, which can be learned by referring to that number.



The Reverberatory Furnace.

Cuts on this page show side and front elevation of a reverberatory furnace, which are presented in order to give with them a set of technical terms applicable to this type of furnace. A glossary of furnace terms has been prepared by Prof. Thos. Egleston of New York. The proper names for the different parts of this furnace may be learned by reference to the figures on the cuts, and the following list: 1—ash-pit; 2—ash-pit doors; 3—grate-bar bearers; 4—grate bars; 5—fireplace or chamber; 6—stock-hole door-frame; 7—stock-hole door; 8—slide for stock-hole door; 9—door counter weight; 10—counter-weight support; 11—combustion chamber; 12—fire bridge; 13—fire-bridge wall; 14—air-chill; 15—water-chill; 16—working or charging door; 17—working hole; 18—frame of working door; 19—water-cooled sill; 20—laboratory, kitchen, pot, hearth; 21—fore plate; 22—cinder tap; 23—bottom plate; 24—beam for bottom plate; 25—hearth; 26—balance for charging-door; 27 flue or neck bridge; 28—flue or neck; 29—roof or arch of the furnace; 30—flue roof; 31—chimney or up-take; 32—outside plates; 33—bearers, anchor bars; 34—ties; 35—cinder tap.



COINAGE FOR A YEAR.—During the fiscal year now closing 1,114,-160.69 ounces of gold—648,839.50 ounces fine and 465,325.19 ounces crude—were received at the United States Mint in this city. The amount of coin turned out during the present year was $23,733,955.40, and during 1888, $25,701,-284 80. The denominations were as follows: Half-eagles, $4500; eagles, $5,907,000; double eagles, $17,447,000; dollars, $108,000; quarter dollars, $112,000; dimes, $155,455.40.

THE azocerite or mineral wax deposits of Utah are located on the Uintah Reservation and can only be worked by permission of Congress. When the discovery was first reported there was a great rush to the deposits, it being supposed that they were outside the reservation, but the soldiers soon convinced the miners of their mistake.

ENGLISH capitalists are talking of buying the Los Angeles electric road.

FRONT ELEVATION OF REVERBERATORY FURNACE.

SIDE ELEVATION OF A REVERBERATORY FURNACE.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Northern Counties of California.

NUMBER 5.

The Pliocene Channels.

[Written for the PRESS by J. H. CROSSMAN.]

The mode of occurrence and system of working the gravel deposits of the Klamath river and its tributary streams was briefly described in the PRESS of the 22d of June. No reference was made, however, to the virgin and as yet undeveloped system of the immense deposits of auriferous gravels in the dead or ancient river channels that course through the northern counties of our State. Of the existence of this detritus and the lava covered Pliocene river channels there is abundant evidence. That the system has been extensive there can be no doubt, but so changed and modified by dynamic disturbances and superficial influences that it is with great difficulty that their course and grade can be accurately determined. It should be the duty of our State Engineer, as well as our State Mineralogist, to ascertain these facts and have these important sources of auriferous wealth carefully investigated, thoroughly examined and noted on a geological map of this region. The U. S. Geological Survey of Major Powell, in 1883 and 1885, by his able corps of assistants, Henry Gannett, chief geographer, Alf. Thompson, geographer in charge, topography and triangulation by Mark B. Kerr, has done much in furtherance of this object. But the geological, mineralogical and stratigraphical features were not sufficiently defined and designated to be of but little benefit to the practical miner. No mention has been made of these important auxiliaries of wealth—this system of Pliocene channels that have at some remote time coursed southerly through these northern counties and added so largely to the auriferous product of the middle and southern portion of our State.

There exists unmistakable evidence of the existence of a system of

Ancient River Channels

That at some remote period coursed through this region, their contents being dissimilar in every important particular to that of the alluvial matter filling the channels of modern rivers. In illustration in the case of a modern stream bisecting or coursing longitudinally with a granitic bedrock formation, its gravels will consist of granitic bowlders, pebbles and coarse granitic sand. If through slate, porphyry or other rocks, the gravelly contents will partake of the nature of the rock through which it flows, naturally depositing in its channel-bed such portions of the eroded mass as the waters could not easily move, regulated in a measure by the specific gravity of the material, the heavier portion, gold, gravitating to the lowest level and eventually finding a resting-place in the crevices of the rocky bed of the stream. In these northern counties we find

Modern Torrential Streams

Of considerable volume and strength that course to every point of the compass from causes previously described. Rivers that contain terraces or benches hundreds of feet in hight, terrace on terrace as successive, and deeper channels, have been formed by the erosive action of the running water, yet the filling is the same and partakes of the general character of the rocky formation through which it has flowed, providing that in its course it shall not have cut into or bisected some Pliocene channel. In that event, which often occurs, the gravels are mixed and partake of the character of both the ancient and modern streams.

The gravelly contents of ancient river channels are largely silicious, crystalline and opaque, and of all colors, from a jet-black to a yellow, red, blue, green and pure white, quartz in size varying from an atom of sand to pieces many tons in weight. The interstices are filled with finely comminuted particles of silicious material with but a small percentage of aluminia or other foreign mineral. At least seven-tenths of the mass is quartz.

Its Metalliferous Contents,

Unlike those of modern rivers, are dissimilar, and consist of smoothly washed particles of scales or rounded nuggets of gold, often superficially black, with the interior of a color peculiar to itself; owing to a copper alloy instead of silver it partakes of a brassy hue, like the old English sovereign, with a fineness much greater than the gold found in modern rivers. It ranges from 875 to 950 fine platinum osmium iridium, with an unusual quantity of titaniferous iron (black sand). Evidences of Pliocene rivers can be found at the following enumerated places—in Siskiyou county and in Oregon—but with little developments and in no instance systematically worked.

At a point in the vicinity of Jacksonville, Oregon (the writer not having investigated northerly from this point), evidences of Pliocene channels are plainly to be seen; thence southerly, following a sandstone formation through the Siskiyou range of mountains, we find (three miles from the boundary line of Oregon and California, on Soda Bar, in the vicinity of Cottonwood creek, Siskiyou county, Sec. 34, Tp. 48, R. 27 W., at an elevation of 3050 feet above the level of the sea) Pliocene gravel with Pliocene gold. There are also its accompanying metals and minerals in paying quantities on the rimrock of what was undoubtedly the bed of an ancient river channel of considerable width and volume. This ancient river had cut its way through a heavy bed of sandstone, whose elevation above its granitic bed was 3350 feet.

This Gravel Deposit

Or river channel was discovered by Mr. W. H. Smith, who commenced to develop it by an open cut, following the gravel in a course which proved on development to be at right angles with the trend of the river; the gravel bank commencing at 20 feet deepened to 58 feet, which he removed by hydraulic. The rimrock pitched into the channel at an angle of 12 degrees. He soon ran out of grade and was forced to run over the rich gravel that lay on the bedrock, having no machinery to sink. He then extended his cut for a distance of 250 feet farther and sunk a shaft to a depth of 45 feet, encountering a stiff blue clay which he penetrated to a further depth of five feet. This clay was found to be rich in the fossiliferous

Remains of Mammoths,

Such as the mastodon and other species from the early geological epochs. Mr. Smith's museum at Henly, over which the madame presides, is well supplied with specimens of the remains of these antediluvian monsters. To all appearances these brutes had visited the marshes and morasses of these Pliocene rivers to slake their thirst and bathe in the cool waters. At the time of the unusual Plutonic disturbance and lava flow, previously described, they mired down in the muddy bottoms or were engulfed in the treacherous quicksand of the stream.

Work on this mine was suspended, owing to want of machinery to handle the increasing flow of water, and to date has not been resumed.

Thence following the apparent course of this river in a southeasterly direction for about six miles to a point where Rancheria gulch intersects the Klamath river on its westerly bank, on an elevation of 300 feet above the river-bed and 2200 feet above sea level, is another claim. Mr. C. R. Jillson, who has had many years experience in this class of mining on the so-called "Blue Lead" of Sierra and Nevada counties, discovered evidences that satisfied him of the existence of a dead river channel, made his locations, and commenced operations. The Klamath river had cut through the channel at a right angle, affording facilities for both adits and dumps for the debris. This channel is now being exploited, water rights secured, and the ditches and flumes are in process of construction.

There is blue gravel and the bedrock is pitching with rich prospects. The formation through which this channel has cut its way is the same as at Soda Bar (sandstone); elevation, 2825 feet, carrying large quantities of marine fossils.

On the east bank of the Klamath, opposite this point, some very interesting fossils are seen in the sandstone. The species are unknown and undetermined, and there are imprints of what bears a close resemblance to the track of a human being. Primeval man of the quaternary period must have been of gigantic proportions, if his stature was in comparison to the size of his foot and stride. Man or beast, he was in keeping with the other mammoth mammalian species found at Soda springs, as the largest track measured 20 inches from toe to heel, with a ten-foot stride. Some casts of smaller tracks with a six-foot stride were taken in plaster, and sent to the California State Mining Bureau, where they can be seen. Similar impressions are seen on the sandstones in the yard of the Carson State prison, Nevada, which have been pronounced by scientists the track of a gigantic sloth.

The same channel appears again five miles in a southeasterly direction on Rocky gulch, a tributary of Cottonwood creek, at an elevation of 2950 feet above sea level, both gravel and rimrock exposed. The gravel is auriferous. But little work of development has been attempted. A rock tunnel was started, which cut through the rimrock of the channel, struck water, and work suspended here as well as elsewhere in this vicinity. Where the channel proper has been bisected by a modern stream and the gravelly contents of the trough exposed, it is found to have cut its way through heavy beds of fossiliferous sandstones to the bedrock proper. The filling of the trough invariably gives good pan prospects of gold.

At Whiteing Hill,

In the vicinity of Scott Bar, a short distance above the mouth of the river, an immense deposit of Pliocene gravel occurs, which has been worked profitably, though not systematically, by Mr. Hicks and others for many years. It is at present being operated by Messrs. J. O. Whitney & Co., by the hydraulic process, with success. This channel is one of great importance. It should be a portion of the duty of our State Geologist to trace out its course and true direction and properly map it whenever the geological work is inaugurated.

LEAD-PENCIL WRITING may be made durable by holding it over steam until it is quite damp, and then allowing it to dry without being rubbed. It will never blur after that treatment.

Salmon-Hatching on the Pacific Coast.

Learning that the veteran pisciculturist, Livingston Stone, was in San Francisco, we recently sought an interview with him and secured the following interesting narrative:

My attention was first called to the U. S. Fishery Commission in the spring of 1866, 23 years ago, and that fall I started the Cold Spring Trout Farm in New Hampshire. I was the first one who engaged in fish breeding in New England, and the second in the country, the other being Seth Green. Then I carried on the Cold Spring Trout Farm for several years in Charlestown. In 1872 was invited by Prof. Baird of the U. S. Fish Commission to come out to California to select places for breeding salmon. It was the first attempt in the U. S. at breeding salmon. Thus I became connected with U. S. Commission in 1872. In the fall of 1872 I made the location on the McCloud river, California, in August. It was selected for a great many reasons which combined to make it a good place, and subsequent events have proved it to be the very best place in California for the purpose. We are very fortunate in that respect. The first year, 1872, we only got about 30,000 eggs, and they were sent to the East to hatch and they secured about 10,000 breeding salmon out of those eggs. These were the first California salmon ever introduced into tributaries of the Atlantic ocean.

That experiment demonstrated the possibility of getting salmon eggs here in California and of getting them across the continent into the Atlantic ocean. The next year we went to taking salmon on a larger scale. In 1873 we got 2,000,000 eggs, and our experience enabled us to adopt better methods in every way. The next year we got 5,000,000 eggs. They all were sent to the Atlantic side to be hatched, and so we went on from year to year until one year we got as many as 14,000,000.

About that time, which was about 1875 or 1876, we began to hatch eggs in the Sacramento river, and we have kept this up ever since. In 1872 we had buildings put up, and every year after that we have made improvements and additions. It is singular that the hatching of the salmon for the Sacramento river increased the salmon very much indeed, but that the salmon we sent to the rivers of the Atlantic Coast were never heard of again. We never knew where they went to. It was very remarkable and very discouraging. When it was found that the salmon we sent to the Atlantic Coast disappeared entirely, the Commission gave up the plan of sending these salmon to the Atlantic, and decided for the future to hatch all the salmon for the benefit of the Sacramento river, and this is being done now. We do not send any salmon East except for some experiment.

When we first went to the McCloud River station there were no white people at all and no settlement, and the Indians were very hostile and did everything that they could to prevent us from settling on the McCloud river. In fact, we were the first white people that ever settled there. They tried to drive us away, but they learned that the white people were too strong for them. We built hatching-house and a mess-house for the employes and quite a large dwelling-house, and one or two other small buildings. When the great flood of 1881 came, it carried away all the buildings. In the summer of 1881, we went to work again and rebuilt the station, and then we put up a mess-house and a large and convenient hatching-house, stable and a building that was used for the postoffice. Since that time we have put up an engine-house and another building that is used for a store and postoffice; and besides that, one or two other small buildings, blacksmith-shop, etc. This summer we are going to put up a very good building for a residence with the object of having a place that will be suitable to live in during the winter. The other buildings are down close to the river. Although they are very convenient and comfortable in the summer, they are too damp in the winter, as I know personally, for I lived there last winter. The new dwelling-house will be on higher ground.

We generally employ about 20 men when the salmon come up, that is, while they are running. During the rest of the year, we keep generally two or three, because there is always something to be done. When the work is over we begin to get ready for the next year. The salmon begin to deposit their spawn about the latter part of August. The eggs are taken from the fish. When the eggs come from the fish, they are like shot. They are taken in pans and properly treated, and then taken to the hatching-house and put into troughs, and there they are kept until they are hatched. The period of hatching depends upon the temperature of the water. If the water is very cold, they are sometimes several months hatching, as, for instance, in New England, they are sometimes four or five months because the water gets very cold; it is almost ice-water, but on the McCloud river, even at the coldest, they are not generally over eight or nine weeks. The McCloud river is fed by springs and retains its warmth in the winter, and there is not much variation in the temperature of the water, not over 15 degrees difference, or at most 18 degrees. That was one reason why it was selected. It is quite remarkable.

If the water is warm, the fish develop quite rapidly, and I think they ought to be put into the river a little before they begin to feed. For the first few weeks after hatching they live by absorption of the sac, which is attached to their bodies when hatched, upon which they live for several weeks. This is called the yolk sac. They are from 1¼ to 1½ inches in length when they are ready to go out. In placing them in the river, we generally try to scatter them as much as possible. If we put them all in together, their enemies would all gather around that spot, and they would fall an easy prey, and the young salmon would not have food enough. We carry them up and down the river and adopt several means to scatter them. The big fish would get the whole of them if we did not.

I have always been in favor of putting the fish into the river before the yolk sac is gone, because then they do not have to come out to feed. When they come out their enemies discover them and the trout and everything is after them, and they are more likely to get destroyed. But if you put them into the water before they have begun to feed, they dive right down and hide, and they can stay there as long as they please. They get used to their surroundings, and the places, and everything, and are more likely to get along better afterward.

The expense has always been borne by the United States Government, but of late years the California Fish Commission has contributed toward the hatching of the salmon, and putting them into the river. The State has a hatching station up at Sissons. We send quite a large quantity of eggs up there after they are taken. We sent over 3,000,000 to the State station and they hatched them. The California station spent nearly $9000. That was for putting the station in repair, catching salmon, taking the eggs, and that includes taking the eggs from two runs of salmon.

We never took any eggs from the fall run of salmon until this year. The eggs have always been taken from the summer run before this, that is, the run that comes up in September. We continue taking nearly through the month of September. This last year we took eggs from the fall run of salmon which come up in November and got a great many eggs. They did just as well and of course we got more eggs on account of it, but it was double the expense. Instead of closing up the station as we usually do in October, we kept it running until March. We shall take both runs hereafter. Sometimes the water will be too high in the fall, but whenever we can get the eggs they will be taken in the fall.

The supply of salmon can be kept up if they will only give us laws to protect enough salmon to come up. It is very important to pass State laws. The last Legislature did about right on that subject. I think they passed almost all the laws necessary except that they did not make the close season quite long enough, but I am not quite sure about that. They enforce the laws pretty well in California, and the fishermen will understand after awhile that it is for their interest. We do not care much how they catch them if they will only let enough salmon come up so that we can get the eggs. There are various ways of catching salmon. They are caught with gill nets mostly on this coast, but also with weirs, traps, pounds, wheels and sweepseines. That is about everything. I do not know which is the most destructive to the small fish, but think the wheels take the most small fish. If the small fish went up they would all die. So there is really no great objection to catching the small fish. The wheels are usually put a good distance up the river and perhaps all the fish that get up as far as these wheels are would never come back any way. I do not see much difference between one way of taking fish and another. One is about as bad as another.

The supply of salmon can be increased very much indeed. Nearly 5,000,000 fish were turned loose from the McCloud station last year into the Sacramento river. The fish came from our station originally.

The station in Oregon is on the Clackamas river, about six miles above the mouth. I selected the station there in 1877. The necessary buildings were put up in that year. The buildings are very much better than they are on the McCloud river. They have nice grounds around them. I was at the McCloud station four months last year and then went to the Clackamas for about a month and to Alaska for three months.

The salmon are diminishing every year in almost all the rivers where there are any canneries. I think if it were not for the artificial hatching, salmon would become extinct and the canneries would have to be closed. There are so many boats out when you look down the Columbia river it is like looking at the flakes of snow in a snowstorm. It is a wonder that any fish get up there at all. If they get past the gillnets they have to run the gantlet of the pounds, etc. So if something is not done by the artificial hatching they would almost become extinct. The increase or decrease of the salmon depends entirely upon the amount that are hatched and the number of people that catch them. The sole cause of their decrease is because they are all caught. If you could limit the catching of the fish, nature would take care of it.

Oregon has one station. The State assists that the same as California does. The Government furnishes all the eggs and hatches quite a number the first part of the season, and then the State comes in the winter and hatches the eggs and distributes them. The Government appropriation for the Oregon station is $10,000 for building it and $5,000 for operating it. The

$10,000 is a special appropriation for building and getting the place in order. They only acquired the place this last year. The annual appropriation will be $5000. About 4,000,000 were hatched there. We took 5,000,000 eggs. If we get 4,700,000 fish we shall consider it a good average. One cannery in a single day on the Columbia river cuts up and cans fish that would create 20,000,000 eggs. If we could only have one day's salmon, we could hatch so many that it would be impossible for them to catch them all afterward.

There are eight canneries on the Sacramento river, 30 on the Columbia, 3 on the Siuslaw river, 1 on Smith river, Cal, 1 on Eel river, Cal., 1 on Rogue river, Oregon, 2 on the Umpqua river, Oregon.

The Legislature of Oregon passed just the laws we wanted right through. In the Senate the vote was unanimous and in the House only five or six dissenting votes, but Governor Pennoyer vetoed the whole thing. The Fish Commissioners were Republicans and the Governor was Democratic. He said that he did it to pay back the Fish Commissioners for what they did for him. Political reasons were at the bottom of it. It is going to set back the salmon culture in Oregon two years. The next Legislature will surely correct it. It was a great disappointment. They passed laws that would enable us to take 20,000,000 eggs at that hatchery, and now it will be with great difficulty that we can get 15,000,000. We have to keep two watchmen there all the time.

The Columbia river salmon are larger and grow more rapidly than those in the Sacramento, and they are better fish for some reason. There is no known cause except that it is a larger river. The larger the river, the bigger the salmon. On the Columbia river, I have known salmon to weigh 93 pounds; the largest salmon on the Sacramento weigh about 50 pounds. One station is not sufficient for Oregon. There should be two other stations just as large as the Clackamas. We have never found any other station like the Clackamas, and the only two places that we know of on the Pacific Coast are the Clackamas and McCloud rivers. Now that railroads are building and running across the headwaters, they may come across others. The sooner they go about building stations the better. There should be about three stations just as large as the Clackamas. One station is enough for the Sacramento river, and even if they wanted more we would not know where to find them.

I expect to leave for Alaska immediately in company with Dr. Bean, the scientist of the expedition, the ichthyologist. He studies up the scientific part of the work and I attend to the fish culture part. We will visit the Kodiak Islands first. When we get there we shall go up a little river called the Karluc. The island is about 100 miles long and about 50 miles wide. We shall make quite a study of the river. It is navigable. There are a good many canneries there, and there are more conveniences for study than anywhere else. Then we shall charter a vessel and go up into Cook's Inlet; will take a tent and camp. We will be gone three or four months, and we expect four to make the party. There will be one man to draw maps and charts, so as to locate all the places we describe. We will examine all the available streams, with a view to establishing Government stations, and will examine everything we can get at. This order to examine these streams was the result of a resolution passed by the last session of Congress to make an investigation of the fisheries of Alaska, with a view of improving them if necessary. A station may not be established at either of these places. We shall not start one until we get a good place. It may be a year and perhaps longer. This year we shall barely have time to get around and look. There are streams up there fed like the McCloud river by springs, so that they will be warm enough.

The further north you go, the larger the fish. On the Yukon river, they catch salmon that weigh 100 pounds. They are immense. This river empties into the Behring sea. It will be more difficult to conduct a station up there because it is so inaccessible. So many unexpected things come up when running a salmon station that a place with which communication can be had only once or twice a month will not answer. The Government is going to give a good deal more attention to Alaska. They have not begun to decrease the Alaska fish and the Government wants to get up there before the people do, to be beforehand instead of behindhand, and can then do its work unrestricted. Laws will not be necessary in Alaska at present. There is plenty of fish and plenty of room. The only people there are the cannery men, and they want the supply kept up. The development of the industry is practically unlimited. There are 20 canneries in Alaska at the present time. I think there is a Fish Commission in Washington Territory, but they have not done much. There are nine canneries in Washington Territory.

COUNTRY AND CITY LUNGS.—A few days ago a New York specialist in pathology showed the writer two bottles. One contained a section of a healthy lung of a man who had lived in the country, and the other the lung of a man who had lived and died in New York. The country lung showed a clear pink color; the city lung was almost black, and it was impossible to trace the veins through the smut and dirt.—*Hartford Courant.*

Local Industries.

Mechanical and Manufacturing Interests.

The following statistics of the mechanical and manufacturing industries of the city and county of San Francisco for the fiscal year ending June 30, 1889, have been prepared by Assessor James Nealon:

Agricultural implement manufactories, 3; men employed, 115; value of manufactures, $175,000.

Artificial stone manufactories, 20; men employed, 140; value of manufactures, $700,000.

Axle-grease manufactories, 3; men and boys employed, 15; resin consumed annually, 2000 barrels; fat consumed annually, 40,500 pounds; value of manufactures, $75,000.

Bag manufactories, 3; men, women and boys employed, 150; bags manufactured annually, 13,000,000; value of manufactures, $650,000.

Barrel manufactories, 26; men and boys employed, 575; barrels, half-barrels and kegs made annually, 1,600,000; horse-power of engines, 115; barrels made for sugar refineries, 800,000; syrup kegs made by tub and pail factories, 30,000; aggregate value of manufactures, $1,250,000.

Bed-spring manufactories, 13; men and boys employed, 260; value of manufactures, $750,000.

Bellows manufactories, 3; men and boys employed, 6; bellows manufactured, 1500; value of manufactures, $9000.

Belting manufactories, 5; men employed, 60; value of manufactures, $275,000.

Billiard-table manufactories, 4; men and boys employed, 75; billiard-tables made annually, 500; value of manufactures, $90,000.

Boot, shoe and slipper manufactories, 162; men, women and boys (white) employed, 1500; Chinese, 1800; value of manufactures, $5,000,000.

Box manufactories (cigar), 4; men, women and boys employed, 375; number of boxes made annually, 3,500,000; value of manufactures, $410,000.

Box manufactories (paper), 6; men, boys and women employed, 100; value of manufactures, $130 000.

Box manufactories (wooden), 7; men and boys employed, 400; horse-power of engines, 360; lumber used annually, 19 000,000 feet; value of manufactures, $1,000,000.

Brass foundries—Men and boys employed, 310; value of manufactures, $475 000.

Breweries, 24; men employed 700; hops consumed annually, 1,150,000 pounds; barley, 55,640 tons; beer manufactured, 641 990 barrels; aggregate value of product, $3,950,000.

Broom manufactories, 8; men and boys employed, 65; value of manufactures, $125,000.

Brush manufactories, 4; men and boys employed, 50; value of manufactures, $75 000.

Candle manufactories, 2; men and boys employed, 150; candles manufactured, 125,000 boxes; value of manufactures, $250,000.

Carriage and locomotive car-spring factory, 1; men and boys employed, 12; springs made annually, 75 tons; value of manufactures, $27,000.

Carriage and wagon manufactories, 48; men and boys employed, 500; carriages and wagons made annually, 1700; aggregate value of manufactures, $1,200,000.

Chemical works, 5; men and boys employed, 35; nitrate soda used, 350 tons; sulphur soda used, 1000 tons; nitric acid produced, 245,000 pounds; value of manufactures, $165,000.

Cigar manufactories, 260; men, women and boys employed (about 425 white men), 4500; cigars manufactured annually, 162,600,000; cigarettes manufactured annually, 55,000,000; value of manufactures, $6,900 000.

Clothing manufactories—Men, women and boys employed, 2500; value of manufactures, including overalls, suits and underwear, $6,000,000.

Coffee, spice and yeast powder factories, 13; men and boys employed, 150; coffee ground and roasted annually, 8,000,000 pounds; chocolate made, 500,000 pounds; spices and yeast powder, 1,400,000 pounds; value of manufactures, $2,000,000.

Coffin manufactories—Men and boys employed, 30; value of manufactures, $100,000.

Coppersmiths, 6; men employed, 23; value of manufactures, $120,000.

Cordage and rope factory, 1; men and boys employed, 200; hemp rope manufactured, 3500 tons; horse-power of engines, 250; value of manufactures, $700,000.

Cracker manufactories, 3; men and boys employed, 250; horse-power of engines, 100; value of manufactures, $950,000.

Cream tartar works, 1; men employed, 10; cream tartar made annually, 300 tons; value of manufactures, $90,000.

Cutlery manufactories; men employed, 25; value of product, $55,000.

Dry-docks (floating), 2; men employed, 45; capacity of docks, first, 4400 tons; second, 2000 tons; total, 6400 tons.

Dry-docks (stone), 1; length of excavation in solid rock, 450 feet; width of top, 120 feet; depth, 30 feet; width of entrance, 90 feet; capacity of length, 425 feet; capacity of drawing, 22 feet; capacity of pumps for clearing per hour, 325,368 cubic feet; tubular boilers of 4-inch tubes, 4; dimensions of each boiler, diameter 25 inches; fire surface of boilers, 3800 square feet; men employed, 8; total cost of work, $675,500.

Electric machinery works, 1; men employed, 35; value of manufactures, $15,000.

Elevator manufactories, 5; men employed, 35; elevators made annually, 50; value of manufactures, $25,000.

Flour and feed mills, 17; men and boys employed, 375; flour made annually, 410,000 barrels; hominy made annually, 300 tons; buckwheat and rye flour, 650 tons; oatmeal and groats, 3000 tons; cornmeal and farina, 1800 tons; feed barley, 18,750 tons; cracked wheat, 950 tons; split peas, 250 tons; cracked corn, 1600 tons; ground feed, 8500 tons; pearl barley, 355 tons; graham flour, 5500 barrels; aggregate value of manufactures, $3,950,000.

Foundries, machine shops, boiler and iron works, 40; men and boys employed, 4375; pig iron consumed annually, 14,650 tons; bar iron consumed annually, 16,000 tons; rivets used, 600 tons; horse-power of engines, 2600; aggregate value of manufactures, $7,000,000.

Fringe manufactories, 6; men and women employed, 150; value of manufactures, $400,000.

Fruit-preserving factories, 9; men and women employed, 100; fruit and meats put up annually, 2,000,000 dozen cans; aggregate value of manufactures, $3 250,000.

Fur manufactories, 6; men and women employed, 150; value of manufactures, $320,000.

Furniture manufactories, 19; men and boys employed, 840; lumber used annually, 9,000,000 feet; value of manufactures, $1,250,000.

Fireworks, 1; men and boys employed, 10; value of manufactures, $35,000.

Gas works, 2; men employed, 520; value of manufactures, $12,000,000.

Glass staining, cutting and bending works, 3; men and boys employed, 60; value of product, $900,000.

Glass works, 1; men and boys employed, 120; furnaces, 1; pots, 8; aggregate value of manufactures, $350,000.

Glove manufactories, 2; men and girls employed, 750; value of manufactures, $710,000.

Glue manufactories, 2; men and boys employed. 30, glue made annually, 375 tons; neats-foot oil made annually, 25,000 gallons; value of manufactures, $120,000.

Gutta percha and rubber factories, 2; men employed, 6; sets of machinery, 2; value of manufactures, $20,000.

Hat and cap manufactories, 6; men and women employed, 150; value of manufactures, $450,000.

Harness manufactories, 51; men employed, 500; value of manufactures, $1,335,000.

Ice manufactories, 1; men employed, 5; tons made annually, 3500; capital invested, $10,000; value of manufactures, $14,000.

Ink and mucilage manufactories, 1; men employed, 15; value of product, $36,000.

Japanning and galvanizing factories, 4; men and boys employed, 25; value of manufactures, $200,000.

Jewelry manufactories, 16; men employed, 160; value of manufactures, $1,000,000.

Laundries, white, 106; men, women and boys employed, 1050.

Laundries, Chinese, 301; men employed, 2700.

Last manufactories—Men employed, 15; lasts made annually, 18,500; value of product, $18,000.

Lead pipe and shot factory, 1; men employed, 30; lead pipe and shot made annually, 2500 tons; horse-power of engines, 100; value of product, $330,000.

Linseed-oil works, 2; men employed, 65; oil cake manufactured annually, 5500 tons; product of works, 1,335,000 gallons; value of oil, $875,000; value of cake, $100,000.

Macaroni and vermicelli factories, 7; men and boys employed, 60; macaroni and paste made annually, 140,000 boxes; flour used annually, 8500 barrels; value of product, $122,000.

Malt-houses, —; men employed, 125; grain malted annually, 32,400 tons; value of manufactures, $3,800,000.

Marble works, 30; men employed, 125; value of product, $275,000.

Match factory, 1; men and boys employed, 85; matches made annually, 2,200,000 gross; value of manufactures, $55,000.

Mirror manufactories, 3; men employed, 40; number of square feet made annually, 100,000; value of product, $200,000.

Musical-instrument manufactories, 19; men and boys employed, 80; number of pianos and organs made annually, 500; value of manufactures, $150,000.

Oakum manufactories, 13; bales made annually, 8500; value of product, $30,000.

Oil-cloth manufactory, 1; men and boys employed, 20; value of manufactures, $20,000.

Onyx manufactory, 1; men employed, 8; value of product, $16,000.

Potteries, 1; men employed, 20; value of manufactures, $110,000.

Provision packing factories, 5; men employed, 300; beef packed annually, 10 000 barrels; pork, 10,000 barrels; ham and bacon, 3,750,000 pounds; lard, 1,500,000 pounds; tallow, 2,000,000 pounds; value of product, $1,900,000.

Rolling-mill, 1; men employed, 800; horse-power of engines, 700; scrap-iron used annually, 15,000 tons; coal consumed, 19,000 tons; value of product, $1,300,000.

Rubber-stamp manufactories, 8; men employed, 33; value of product, $52,000.

Safe and vault works, 2; men employed, 20; bar and plate iron used annually, 40 tons; steel used, 65 tons; value of manufactures, $42,500.

Saw manufactory, 1; men employed, 40; horse-power of engine, 35; steel used annually, 1700 tons; value of manufactures, $130,000.

Shipyards, 6; men employed, 300; number of steamers, barges and other vessels built, 22; tonnage, 15,400; value of craft built, $2,765,000.

Shirt manufactories, 35; men and women employed, 2400; value of manufactures, $1,000,000.

Silverware manufactories, 3; men employed, 40; value of manufactures, $350,000.

Soap factories, 23; men employed, 275; soap made annually, 17,500,000 pounds; value of manufactures, $950,000.

Salt works, 1; men and boys employed, 40; run of stones, 7; number of tons annually, 20,000; value of product, $153,000.

Sash, door, blind and finishing factories, 2; men employed, 1550; horse-power of engines, 900; lumber used annually, 10,100,000 feet; value of manufactures, $5,000,000.

Soda-water works, 13; men employed, 130; value of product, $100,000.

Solder and babbit works, 2; men employed, 20; value of manufactures, $100,000.

Sugar refineries, 2; men employed, 900; raw sugar used, 91,000,000 pounds; white sugar made, 60,000,000 pounds; yellow sugar made, 25,000,000 pounds; syrup made, 500,000 gallons; value of manufactures, $11,000,000.

Tanneries, 23; men employed, 300; horse-power of engines, 200; bark used annually, 4500 cords; hides of all kinds, 255,000; value of manufactures, $1,450,000.

Tinware, tin box and can factories, 6; men and boys employed, 600; value of manufactures, $1,000,000.

Trunk and valise manufactories, 3; men employed, 205; value of product, $910,000.

Type foundries, 3; men employed, 50; value of manufactures, $60,000.

Vinegar and pickle factories, 6; men employed, 85; vinegar made annually, 950,000 gallons; pickles preserved, 115,000 gallons; value of manufactures, $175,000.

White-lead manufactory, 1; men employed, 50; number of tons made annually, 3000; capital invested, $250,000; value of manufactures, $361,000.

Windmill manufactories, 3; men employed, 50; number of mills and casks made annually, 500; value of manufactures, $40,000.

Wire and wire-rope manufactory, 1; men employed, 200; horse-power of engines, 360; wire consumed annually, 10,000 tons; value of manufactures, $950,000.

Wool-scouring and grading mills, 6; men employed, 175; wool scoured annually, 15,000,000 pounds; value of product, $4,500,000.

Woolen-mills, 2; men and women employed, 750; number of power looms, 180; cards set, 65; frames for knitting hosiery, 24; spindles, 17,000; blankets made annually, 50,000 pairs; hosiery made annually, 20,000 dozen; wool (clean) used annually, 1,500,000 pounds; cloth, tweed and flannel made annually, 1,000,000 yards; aggregate value of manufactures, $1,100,000.

THE VALUE OF SOAPSTONE.—One of the valuable minerals of this country of which the output is largely increasing is talc or soapstone. It is used for dressing skins, leather gloves and similar purposes, but its greatest use is as an adulterant. For this it is peculiarly fitted on account of its lightness, being employed as a filler chiefly in the manufacture of soap paper, and rubber, and to a certain extent as a lubricant with other substances. It is also used for making slate pencil, crayons, stoves, ovens, lime-kiln linings and hearths, and also, being acid proof, for sizing rollers in cotton factories. In Alabama it is used for headstones. The American aborigines used it for culinary articles, and the Chinese for the carving of their idols. Its lightness and its fibrous character admit of its almost entire incorporation (90 per cent) with paper stock, while clays and other materials which it replaces are only available to the extent of 30 or 40 per cent. It is known to commerce by such names as pulp, mineral pulp, agalite asbestine pulp and others of the same character.

FRESH BOILED WATER NECESSARY FOR A GOOD CUP OF TEA.—All tea and coffee drinkers can tell by their taste if the water from which the beverage is made has not boiled or boiled too much. Either of these conditions will spoil the flavor of the costliest tea or the best coffee berry. But not every one knows the reason or how to avoid the result. The secret is putting good fresh water into a clean kettle already warm and setting it to boil quickly, then taking it right off to use in tea, coffee, and other drinks before it is spoiled. If the water is allowed to steam and simmer and evaporate till all the good of the water is in the air and all the lime and dregs left in the kettle, you must not expect a well-flavored cup of tea or coffee.

TRANSFUSION OF BLOOD.—Count Percy N. Deduboeag of Tallula Falls, Ga., a physician of considerable repute, was called to the bedside of Mrs. S. White, lately of New York, and a very wealthy lady. Mrs. White had fallen from a cliff and sustained the loss of an immense quantity of blood. The physician, without hesitation, opened a blood-vessel in his arm and passed a large quantity of blood into a similar vessel in his patient's arm, no other physician being present. Count Deduboeag, after suffering the loss of blood, had to stop the flow in his own arm, and then administer to his patient, and before the operation was completed he almost fainted from weakness and loss of blood.

EUREKA has 13,000 feet of street railway track in use.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

LIVE OAK.—Amador *Ledger*, June 29: The Live Oak mine and mill, three miles west of Jackson, have come to a standstill. To all appearance operations have been permanently abandoned, as far as the present owners are concerned. The rock was of fine grade, but the ore body was small, and working with a two-stamp mill the expenses were too heavy. It has been in operation, with short intervals of inactivity, for about three years.

AT the Amador mine the finishing touches are being placed upon the new hoisting machinery. It is probable that the change from the old to the new machinery will be made within the next two weeks. The method of supplying the water-power to the different machinery is a novelty, at least in this county. A large 22-inch pipe brings the water from the canal. This pipe discharges into a large tank. From this tank four small pipes, about six inches in diameter, will run—one to operate the hoisting machinery, one for the air compressor, etc., running four distinct sets of machinery by one main pipe. Of course, the main pipe will carry more water than all four small pipes. The tank will always therefore be full; and it is claimed that the result will be the same as though all pipes were connected directly with the canal. The advantage is that it saves the expense of laying several long stretches of pipe. The nugget taken from the Arroyo Seco gravel mine last week weighed 5¾ ounces.

SUTTER CREEK.—There is considerable anxiety manifested here on the question of who will purchase the Mahoney mine, or whether it will be sold at all. The property has been bonded for some time; the bond expired on the 24th instant. It has been generally understood that were at least two companies willing to purchase it at a reasonable figure; the Wildman Co. and the owners of the New London.

AT the Kennedy sinking is in order in both shafts. The mill is kept running to its full capacity of 40 stamps.

DRYTOWN CON.—*Dispatch* June 29: They are down 20 feet in new sinking; the porphyry is cutting out and a ledge of ore is coming in on the footwall. In 50 feet more the shaft will be all in ore, then the ore body will be 10 feet wide.

COSMOPOLITAN.—They sunk 43 feet for the month ending the 20th, having only two men on a shift, which is very good work for two men. Mr. Allen was looking out a road so as to get in lumber for the new mill, which will be started next week by Knight & Co., the contractors.

HENRY CLAY.—The contractors are pushing this tunnel in as fast as possible; have great deal better ground this week and are making good headway; have passed through considerable quartz this week.

GINOCCHIO.—Parsons & Co. are running their Huntington mill, which is doing good work; the ore is turning out very well.

BLACK HILLS.—This company are about to sell to an English Co.; it can be made a dividend paying mine in a short time with capital.

GOVER.—Are running along steadily and are doing about the same work as of yore; will put in two more concentrators soon.

El Dorado.

MOVED OFF,—Placerville *Observer*, July 2: The so-called Rudd pulverizer and amalgamator has been moved off the Stewart mine. The promoters of this machine represented to Mr. Stewart that it would work one hundred and fifty tons of gravel per day, and that it would save every color of gold; and that it did not require more than twenty minutes to clean it up at any time. It is unfortunate that such representations should be made to mine owners for the purpose of securing leases on mines to work on royalty. This is often done by men of small means, without experience in mining, but have sufficient egotism to justify them in the belief that they can manage a mine as well as they could a patent medicine peddler's cart.

DONCASTER.—Placerville *Observer*, July 1: Fourteen tons of ore taken from Doncaster mine, Kelsey district, recently worked at the Big Tunnel company's mill at Poverty Point, yielded thirteen ounces of melted gold. This ore was taken indiscriminately across the full width of the large vein.

Inyo.

THE SODA WORKS.—Inyo *Register*, March 29: The Inyo Development Co. has expended well on to $100,000 in their efforts to build up a paying business in the manufacture of soda from the waters of Owens Lake. Until recently it still remained a matter of painful uncertainty as to whether success or disastrous failure was to be the outcome. But now we are perfectly assured, that no doubt whatever exists in this matter. It is a great success, and in time, and but a short time at that, these Owens Lake soda works will produce a greater quantity and higher grade of merchantable soda than any other works in the world. From 40 to 60 workmen are now employed, and it is quite probable five times that number will be put to work within a year, and as rapidly as added machinery and appliances will permit. Among other things in this line is the great furnace soon to be erected. B. F. Gray is in immediate charge, and to his practical knowledge of the business is due very much of this assurance of final success. It is a great enterprise and certain to be of importance to this county and section.

IDLE MINES IN ANGELS.—Angels *Monitor*, June 27: If capitalists are of the opinion that all the best mines of Angels are now in the hands of men of large means and in operation, we beg to inform them that such is not the case. There are numerous other mines in this town and its immediate vicinity that are now idle and have been for years past. We are satisfied that some of them could be bought at a reasonable figure. There are the Marshall or Winter mine, the Fritz mine, the Gold Cliff mine, the Lightner, the Crystal and the Confidence mine, all of which are, in our opinion, equal to those in operation.

STICKLE.—Improvements are going on at the Stickle mine in various ways. The gallows-frame over the shaft has been raised ten feet higher during the week, and the work of sinking the shaft several hundred feet deeper will be commenced in a few days. Work has been suspended in the stopes pending the sinking of the shaft. The chlorine works in this place is kept in operation day and night, reducing sulphurets taken from the Utica and Stickle mines. Work is going on actively at the Angels mine, and extensive improvements are being made to better develop the property. This is one of the best mines in the town.

DEEP SPRING.—Greenly & Broder are making a shipment of ore from their mine in Deep Spring Valley. The ore is very rich, running up into thousands of dollars per ton. The vein is small, but the mine is looking as well as at any former time.

WILD ROSE DISTRICT.—Inyo *Independent*, June 29: Over in Wild Rose district tailings have recently been tested that carry more silver than was got from the ore when it was milled. It is the fact all over the country that heavy loss has been caused to miners by letting the gold and silver escape in the tailings.

BORAX.—The first shipment of borax from Conn & Trudo's works in Saline Valley was made last Tuesday. The borax is of very fine quality and if the weather will permit regular shipments will be made. Many predicted that borax could not be made in Saline Valley, but Messrs. Conn & Trudo have shown that such is not the case, and they are well satisfied with their prospects.

DEATH VALLEY.—William Harrington got in last Monday from a prospecting trip of several weeks over in the Death Valley country. He found several ledges of very good-looking silver ore and brought in samples for assay. The ledges are near the line of the Salt Lake and Los Angeles railway and will be easy of access from that road.

Mariposa.

PINE TREE.—Mariposa *Gazette*, June 29: A ledge of very rich rock was struck in the Pine Tree mine at Bear Valley last Saturday. Work has been quietly progressing for some time at this mine, and we are glad that the faith of the owners has been met with success. The reputation of the Pine Tree, the Princeton, and the old Mariposa mines, in early days, would fully warrant a large force of men being put upon each, and it is to be hoped that the good luck at the Pine Tree will incite the Grant people to renewed faith and work on all the principal mines on their vast estate.

BARLEY FIELD.—Messrs. McCormick, Ridgway and Hay have struck a vein of exceedingly rich rock in their mine at the Barley Field. They had only gone down about twenty feet on their new shaft when they came on a vein about twenty-eight feet wide, which, if it continues, and there is every indication of its holding out, will prove a big bonanza. Their mine is in a locality noted for its great mineral wealth, and although much gold has been taken from the Barley Field, there is still an immense body of ore which has never been prospected. It is always cheering news to hear of good strikes being made, and we hope to be able to chronicle many more during the present year.

Mono.

QUEEN.—Inyo *Independent*, June 29: It is expected that the Queen mine, near Benton, will soon be in operation with a large force of men. The mine turned out several millions of dollars some years ago, but not much has been done there of late. Recently two men opened up a claim adjoining the Queen on the north; they are reported to have found a good body of ore. They have a tunnel much deeper than the old workings of the Queen and it is proposed to work their mine from this tunnel. No doubt is entertained that plenty of as good ore will be found as was taken from the mine formerly.

Monterey.

LOS BURROS MINES. — Cor. Salinas *Index*, June 29: Los Burros mines, or as they are more commonly called, the "Cruikshank" mines—owing to the first discoveries being made by Cruikshank—are about 60 miles from Paso Robles. They are accessible from various directions from Paso Robles. You can go by wagon to the crossing of the Nacimiento river at King's Camp, and from there a pack train furnishes horses to ride into the mines, over a trail twelve miles. You can also go from Kings City to the mines, and by steamer from San Francisco to San Simeon, where you can obtain horses, and an easy day's ride will bring you there. For two years these mines have been known, and a great deal of prospecting has been done, but until very recently no developments have been made worthy of note. The Cruikshank mine has been working continually, and a great amount of gold has been taken out, considering the poor way in which they have had to get along, having no roads by which large machinery could be brought in. They succeeded in getting a small three-stamp mill in over the mountains, and have taken out something over $90,000 in gold, but find that this process does not save enough, and have discontinued work in the mill until such time as they can get in better machinery. They are still working in the mine, however. The ore has a great average of sulphurets, and this carries gold, and must be saved, and for this it needs chlorination works. Outside the Cruikshank no mills have been put in, as the mines have been only prospected. But now several companies have been organized to work their claims. The Brewery mine has, I am informed, been sold to a San Francisco company, and works will be put up immediately. This mine has a ledge of some thirty-six inches in width, all bearing gold in large quantities, and from what is already in sight, the outcome will make its owners millionaires. The Grizzly, owned by Ballou, Fancher and others, is probably the best mine in the whole camp, showing a well-defined ledge a few feet from the surface of over 17 feet in width and rich in gold and silver throughout. An average assay of the ore of this mine gives returns of $241 to the ton. All has not yet been told. P. Gillis has a claim that bids fair to make him more fortunate than the rest, in having a running stream of water. He has washed out nuggets to the value of several hundred dollars in the gullies below the claim.

Placer.

A RICH GRAVEL MINE.—Grass Valley *Union*, June 29: The Red Point gravel mine, which is on the auriferous old river channel in the eastern portion of Placer county, is now yielding at the rate of $1000 per diem, the gravel being very rich. The Red Point mine is owned by the French syndicate which purchased the Succor Flat gravel claims near Iowa Hill, a few years ago, at an enormous figure, only to discover a few months afterward that the property was comparatively worthless, the swindle being among the worst ever perpetrated on the coast. After the failure of the Succor Flat investment the Frenchmen were recommended by John B. Hobson of Iowa Hill to purchase the Red Point ground and undertake its development, as its location was considered favorable. The syndicate had some money left from its Succor Flat purchase, and concluded to take the ground, paying $30,000 for it. During the last two years and over, a tunnel has been driven into the gravel channel, and as stated above, rich pay has finally been reached. It is possible the syndicate may be lucky enough to make up its loss of $100,000, out of which it was swindled by the Succor Flat investment.

IMPROVING. — Placer *Argus*, June 29: Mr. Chappellet writes with regard to the Live Oak mine: "Since last report the ground in prospecting drift has improved. The bedrock does not raise more than the ordinary grades of other channels, and as we are on the same level as other channels (May Flower with the rest), it is to be expected that we will find good ground just ahead of us."

Plumas.

THE SAVERCOOL.—Greenville *Bulletin*, June 29: From Alexander Cameron, who was in town Monday, we learn that he has five men at work driving the lower tunnel of the Savercool mine ahead. He expects to reach the ledge in a short time. This tunnel is now in 200 feet. The backs obtainable with the lower tunnel are 1800 feet. The development work is being done by authority of New York parties, who agree to put up sufficient money to prosecute the work for 18 months. If necessary, the drift will be put in 1500 feet. The owners have faith in the development of a big mine. They have in readiness a 40-stamp mill fully equipped for work and so situated that the ore can be delivered to it and crushed very cheaply.

Sierra.

THE BUFFALO MINE.—*Tribune*, June 28: The Buffalo G. M. Co. will not be able to do anything with their mine until the assessment, which has been levied, is paid. Then it is their intention to put in an engine and work the mine as it should be worked.

Siskiyou.

QUARTZ.—Yreka *Journal*, June 29: We were shown an exceedingly rich specimen of gold quartz last Thursday, by Mr. A. Ball, taken from the Mountain Laurel ledge, at Salmon river, in which he is interested. It is nearly as large as a man's hand, and seems to contain nearly as much gold as quartz. A ton of such rock would yield over $30,000, and was a sample of the richest taken out, lying next to the hanging wall. The Allen brothers, of Quartz Valley, have been successful lately in their quartz ledge, and expect to take out more gold this season than ever before. Mr. Boyle, who has just opened a ledge of quartz at head of north fork of Humbug creek, and built a wagon road to it, had a ton of the ore crushed last week, on trial at McCook's mill, which yielded $115. He now intends getting out plenty more quartz, believing he has discovered a bonanza of great richness and extent. There are over sixty miners at work on Humbug creek, all doing well, and the general belief now is that Humbug will become the richest mining district in the county in spite of the name given it in early days when the placer diggings, worked out to a great extent, proved so rich. There are several rich ledges on Humbug creek, such as the Siskiyou, Eliza, Mount Shasta, Cornish, Mexican, Brown Bear and others which, if properly worked by practical miners, will pay handsomely. Good quartz mines exist on the Klamath river side of the Humbug divide and on the Yreka side also. Report says the Steamboat mine at McAdams creek will be again started up under the management of J. B. Eldredge. The bed of McAdams creek contains rich deposits of auriferous gravel in great quantity, but the great difficulty is to get good drainage, requiring the constant use of powerful steam pumps.

Santa Barbara.

BEACH MINING.—San Luis Obispo *Republic*, June 27: Mr. Paschal Dallidet, of this city, is quite heavily interested in the mines of the Sierra Nevadas. Reading of the beach mining along the coast from Point Sal to Point Conception he visited the region to make an investigation of the reported mines and ascertain their value. Near Point Sal he found the miners who occasionally dig for gold in that locality. Eight years ago a rich body of black sand was found and several thousand dollars taken from it in a few months. This created quite an excitement, but difficulties in mining occurred, and with poor appliances for working them the mines were abandoned. But work will soon be resumed. The principal works Mr. Dallidet found on beach four miles south of the Santa Ynez, owned and worked by Messrs. Charles Lausser, I. Saller and W. S. McKay. These men work three large rockers, with five men to each, and usually take out $20 a day to each rocker. The result depends greatly upon the condition of the weather and the ocean, as the high waves interfere with the work. In the latter part of April these three men commenced work with one rocker and have taken out $1300 in gold dust. The dust is very fine, the flakes being scarcely discernible by the naked eye, and being associated with heavy black sand and find platinum, is very difficult to separate. The rockers used are about ten feet in length, the upper part of the washing bed having plates coated with a blanket. On these plates and in the blanket the gold is saved; also considerable platinum, the latter selling for $8 a pound. The mining is carried on very crudely, a barrel, into which water is carried by buckets, being placed over each rocker and the water being let on by a hole in the bottom and is run into a little pool from which it is baled and used again in the same manner. The auriferous black sand is found in a stratum usually found covered by common sea sand. The men being much in the water, and often washed with ocean waves, go barefooted, with pants rolled up, making their work disagreeable and endangering health. The men employed receive $2 per day and are boarded, but the proprietors of the claim propose to hire Chinamen, whom they will pay $1 per day and board themselves. Gold is found on the sand beaches from Point Sal to Point Conception, a distance of forty miles, but not always in paying quantities. There are several localities, however, where preparations are making for washing the sand.

Trinity.

EAST FORK.—Trinity *Journal*, June 22: E. Greenwell says work is progressing satisfactory on the Ozark; he is running a tunnel to tap the ledge at a lower depth. In the old tunnels and stopes there is enough ore to run the arastra all summer. The arastra has been running right along and the ore is of the same high grade as formerly. Mr. Greenwell also informs us that John Day and a prospector named Isabel have made a new strike on Rattlesnake; they have found two ledges carrying free gold.

Tulare.

RATTLESNAKE CREEK.—Tulare *Times*, June 29: The peculiar formation that is found to carry gold on Rattlesnake creek also carries a large percentage of black sand, which is reported to be worth in the market about $500 per ton. This sand can easily be saved when working the rock for the gold there is in it. It is thought that about 200 tons of rock will have to be worked to secure one ton of black sand. G. T. Nighbert sent a quantity of ore from the Rattlesnake Creek mines to San Francisco for a working test several weeks since, and the returns show that the rock will yield $5.50 per ton in gold. Selected rock from the mine gives a larger return, but Mr. Nighbert's ore was such as came from the mine naturally and without selection. He has bonded one of his claims for the sum of $3000.

Tuolumne.

A NEW MILL.—Toulumne *Independent*, June 29: At the Golden Gate mine they are grading for a 10-stamp mill, which will be erected as soon as possible. The new hoisting works work to a charm. Supt. Long will continue the shaft 100 feet deeper and says the mine looks splendid, the ore-shoot being over 600 feet in length. The work on the furnace for roasting the ore is being pushed onward.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, June 29: On the 400 level the stopes in the north drift from No. 1 west crosscut continue to yield the usual quantity of good ore. On the 500 level the stopes look well and are yielding the usual quantity of good ore. On the 600 level the north drift was advanced 30 feet; total length, 55 feet. Also started a drift south from No. 2 crosscut and advanced it 40 feet. This connection will greatly facilitate the extraction of ore and will improve our ventilation. From the 600 and 700 levels are extracting the usual quantity and quality of ore. During the week hoisted 752 cars of ore. Shipped to the Nevada mill 682½ tons of ore and milled 692½ tons. Average battery assay, $26.87 per ton. Have shipped $18,336 in bullion since last report.

SAVAGE.—On the 400 level the joint west crosscut was advanced 24 feet in vein material. Are extracting ore from No. 2 southwest crosscut, from the old stopes in the south drift and from the north drift. On the 500 level have started a prospecting drift north from the upraise, which is now advanced 29 feet in quartz and porphyry. Are also extracting ore from the old stopes in the south drift on this level. Have men employed at repairs and easing timbers on the different levels and in the main shaft. During the week hoisted 498 cars of ore, shipped to the Rock Point mill 471½ tons and milled 490 tons. Average battery assay, $20.27 per ton. Shipped $7014.99 in bullion since last report.

BELCHER.—The 1100 raise is up 114 feet on the slope, in about the same material as reported last week. The 1100 south lateral drift from the station has been connected with the west crosscut and a winze started 30 feet east of the ore streak in the crosscut, which is now down eight feet in porphyry, showing streaks of quartz. The 1000 south drift is out 138 feet from the station. The 1200 lateral drift is out 127 feet, and the face is in lively-looking vein material giving small assays. The 200 west crosscut is out 38 feet. The ground is becoming somewhat softer.

SILVER HILL.—The north drift on the 260 level has been advanced 20 feet through quartz and porphyry; total distance from shaft, 330 feet. The northwest drift on the 160 level has been advanced 25 feet through quartz; total distance from shaft, 415 feet. Southwest drift, 160 level, advanced 10 feet; ground very hard; total distance from shaft, 495 feet.

JUSTICE.—The north winze is down 52 feet and the bottom shows four feet in width of good ore. No change to report in the north and south stopes. The shaft is down 88 feet and the bottom is in very hard rock. Shipped to the mill during the week 223 tons of ore, the average battery samples of which was $26 a ton.

EXCHEQUER.—East crosscut, 150 feet south of the north line on the 825 level is out 44 feet; face in clay and porphyry. West crosscut, 150 level, south of north line, is out 56 feet; face in clay and quartz. North lateral drift on 500 level is out north of the Alpha shaft 581 feet; face in hard porphyry.

CROWN POINT.—The 500 raise is up 75 feet and the ground is becoming somewhat softer as they advance. The pay streak on the 13th floor south stopes, going south, looks about the same as at last report. The 300 and 400 north stopes look the same also. Shipped to the mill during the week 829 tons of ore.

POTOSI.—The south lateral drift on the 750 level is out 497 feet; face in porphyry. The south lateral drift on the 650 level is out 434 feet; face in hard porphyry. South lateral drift on the 930 level is out 768 feet south of the Chollar shaft; face in clay and porphyry.

CONFIDENCE.—The joint Confidence, Challenge and Imperial north drift on the 500 level has attained a length of 728 feet from the Yellow Jacket shaft, 29 feet having been added during the week. The face is in quartz giving low assays.

CHOLLAR.—East crosscut 150 feet south of north line on the 550 level is out 72 feet; face in low-grade quartz. The north lateral drift on the 750 level is out 326 feet; face in porphyry with streaks of quartz giving low assays.

CON. IMPERIAL.—The north drift on the 300 level is now in a distance of 188 feet from the south line of the mine, having been advanced 37 feet during the week. The face shows porphyry.

OVERMAN.—Have run the mine six days. Extracted 248 tons of ore and shipped to the Vivian mill 240 tons. At the top of the upraise from the east drift have extended the south drift 25 feet; total

length, 69 feet. Formation porphyry and quartz. Are repairing the Lambert tunnel.

NEW YORK.—The north lateral drift from the northwest crosscut on the 800 level is out 65 feet; face in clay and quartz. This drift is being run on the east side of the ledge.

ALPHA.—The 500 level east crosscut, 50 feet north of Alpha shaft is out 44 feet; face in quartz and clay of no value. The west crosscut on the south line is out 93 feet; face in clay.

SEG. BELCHER.—The 1100 raise is up 112 feet, having advanced 39 feet during the week. The top of the raise shows a streak of quartz two feet wide, which gives fair assays.

SCORPION.—On the 520 level the east drift from the Sierra Nevada shaft was advanced 55 feet during the week; face in porphyry and clay showing some water.

ALTA.—The usual work is reported from this mine and extracting the same quantity and quality of ore. The mill is running steadily.

BALTIMORE.—Are extracting ore of good grade from the crosscuts on the 225 and 338 levels. Both places are quite wet.

YELLOW JACKET.—Are shipping about 100 tons of white gold rock daily to the Brunswick mill.

BULLION.—Still drifting north in the vein in the 760 level.

Cedar District.

A MINE SOLD.—*Silver State*, July 1: M. H. Sunderland has purchased the Mohawk mine of the owners, Messrs. Frank and Ed. Clark, William Poole, Jehiel Smith and Charley Harvey. A part of the purchase money has been paid and the balance will be paid to-day. Cedar district is situated in the Antelope range, about 22 miles from Humboldt House.

Central District.

GOOD RESULTS.—*Silver State*, July 1: J. F. Clark & Co. are working the Aurum mine. They shipped a car-load of ore from it to the Reno Reduction Works recently, one lot of which yielded $331 in gold and $81 in silver to the ton, and another lot $200 in gold and $38 in silver to the ton.

Ely District.

DRY PROCESS.—White Pine *News*, June 29: A nice little bar of bullion, the product of twenty-four tons, and valued at $500, was shipped by the Ely Gold Mining and Milling Company this week. The ore was worked by the dry process and gave the best result yet attained—$19 per ton out of a pulp assay of $22. Could this average be kept up the property can be worked to a good profit.

San Diego.

HELVETIA.—Julian *Sentinel*, June 29: The old Helvetia mine, lately purchased and now worked by Smith & Murray, is being pushed forward. These gentlemen are driving a tunnel from a canyon about 350 feet west of the old works, in on the ledge to the stoping-ground west of the old air shaft. They are now in 85 feet and have had pay ore from the beginning, but in the last few days have struck a splendid body of quartz, some of it showing free gold and all of it prospecting well. A stamp-mill is a necessity in the near future and will be put up before beginning work on an extended scale. The engine on their mill-site, which runs a ten-stamp mill and pounded out thousands of dollars for the old owners of the mine, will be taken and used for hoisting purposes.

Tuscarora District.

BELLE ISLE.—*Times Review*, June 29: West crosscut from the end of north drift, 250-foot level, extended 19 feet.

COMMONWEALTH.—East intermediate drift, from No. 14 chute, advanced 17 feet; has 15 feet farther to be run before reaching the ore opened up by No. 8 drift. North intermediate from east lateral winze extended 10 feet, exposing fine ore. South intermediate, extended 9 feet, developing a fine large body of ore. North drift from No. 1 winze, advanced 13 feet; total 90 feet, showing good ore the entire distance. West intermediate drift from No. 11 raise, advanced 32 feet, showing good ore. There is but little change in the stopes. North of the shaft, a greater length of stopes is being made. The ore is high-grade. South stopes, the yield and quality is fully as good as heretofore; 228 tons have been sent to mill. Battery pulp assay $130.33. Bullion shipped, $13,127.50 and $12,396.34. Mine and mill are both running well.

NEVADA QUEEN.—Winze from the 450-foot level has been sunk 10 feet. Total 46 feet. The ore has been very regular, assaying $180 per ton. Crosscut on 350-foot level has been advanced nine feet; quite a flow of water has been encountered. South drift from the 150-foot level of Commonwealth advanced seven feet. Small seams of very high-grade ore have been showing in the face, and is looking very favorable.

DEL MONTE.—East crosscut from north drift, 100-foot level, extended 11 feet. An upraise was started 10 feet from the face and carried up eight feet, cutting into high-grade ore.

NORTH COMMONWEALTH.—No. 1 upraise from east crosscut, 100-foot level, extended five feet and discontinued for the present, and the crosscut has been started ahead and advanced ten feet.

GRAND PRIZE.—The stopes are looking and yielding well. Concentrator is nearing completion.

NAVAJO.—West crosscut No. 3 from the end of south drift, 350-foot level, extended 19 feet.

ARIZONA.

SENSIBLE MINING.—Prescott *Journal-Miner*, June 29: The regular arrivals at the Prescott railroad depot of wagons heavily loaded with gold ore from the Congress mine give substantial evidence of the value of the mineral deposits of our mountains. Culver's teams have just brought in 110,000 pounds to be shipped direct to the smelting works. This is about five carloads, and as the net returns, by the carload, average over $1600, an idea may be formed of the value of this business, which not only puts money into the pockets of the owners, but gives employment direct to hundreds of people and indirectly to thousands. A couple of years ago this mine was lying dormant and neglected. It was hard work to induce any one with capital to even look at it. Many attempts were made to bring it to notice. At last Frank M. Murphy persuaded Diamond Jo Reynolds to go there and to put up the money to open it. The mine is now producing and shipping from 175 to 200 tons of first-class ore a month, which fetches from $150 to $175 per ton for the gold, and a little silver. There is no lead. The ore is a clean pyrite in quartz. It is broken out in large masses, and the second-class ore remains on the dumps. Upwards of 7,000 tons have so accumulated and the new 20-stamp mill now being erected is intended to crush and concentrate this ore and put about four tons into one. This will give a product worth upwards of $200 per ton. This method of working a gold mine is somewhat novel. Gold ores are usually too poor to ship in bulk. But in this case the average is high, and the melters return 95 per cent of the assay value. The gold might be extracted by chlorination, but the first cost of the plant, and the costs of chemicals and manipulation would carry the expenses per ton to nearly the present cost of shipping and treatment. We understand that there are large reserves in the mine, and that every appearance indicates that the property will be a large producer for years to come.

MOHAVE MINES.—*Miner*, June 29: Jno. Barry is busily engaged in putting the little mill at Cerbat in working order, and will, we understand, work custom ore. The shaft in the Crescent in the Peacock mountains will be sunk 100 feet deeper by Wm. Miller and H. W. Hitchcock. Tourtelotte and Wilkins are having another lot of gold ore run through the Flores mill. J. M. Boland and Thos. Stinson are working on a claim near Todd Basin and are taking out 1½ tons of good gold rock each day. In the C. O. D. a considerable body of rich ore has been encountered in the lower level, and the strike improves as work progresses upon it. J. J. Williams, interested in the Copper World and Antler mines, has ordered the suspension of work until next fall. Another and richer strike has been made in the Howell portion of the Prince George. The strike is said to be the best yet made in that mine. Bell and Kostar have this week been experimenting on ore from the Prince George dump by running it through a jigger, which was placed at Lake's windmill. The experiment was not as successful as was anticipated. N. C. Amer has encountered another body of high-grade ore in the Silver King, and it is the largest body yet encountered, as well as the richest.

ORE SHIPPED.—Prescott *Courier*, June 29: The quantity of ore shipped from our mines so far this month will aggregate a total of 180 tons, and about 60 tons are yet awaiting shipment at the sampling works; $15,000, net, has been paid for this ore. McCabe is bringing to the sampling works considerable quantities of ore; Foster & Robinson have some 50 tons on the road for delivery at the works. G. W. Hull and J. Dempsey have located the Monitor North Lode, Gold Pen Lode, the Great Unknown and Monitor South Lode mines in Black canyon. Fred Stull, who has been working under lease in the Hillside mine, tells us he fears that the company will give no more leases. J. E. Anderson, just from Walnut Grove district, has specimens of silver that are worth $10.47 per pound

BRITISH COLUMBIA.

THE MCMURDO DISTRICT.—Cor Donald *Truth*, June 25: Things are looking very favorable in the McMurdo camp for a good summer's work. At present Mr. McCabe is working two shifts on the Southern Cross and Monitor. The party representing the company who are about to operate on Copper creek having been well satisfied with the property, work will be commenced immediately on the Lost Chief and a crosscut tunnel run at a greater depth than the present drift. Jim White is hard at work prospecting Cariboo basin in the interest of Mr. Granger. He has got some fine specimens of what we would conclude to be a free-milling ore, although the nature of surface croppings generally changes with depth. The season in the glacier belt is about as far advanced at present as it was a month later last season, the snow having all disappeared with the exception of a few patches on top of the glaciers. A party of gentlemen from Vancouver are expected in on the beginning of next week, and if satisfied with their trip, from 20 to 30 men will likely be at work out there by the 1st of July.

TOBY CREEK.—Rosemond, Kirkpatrick & Co. have, at an expense of $500, cut a trail up Toby creek to their claims, and are now at work opening them up. If the leads prove good, and the surface showing indicates that they will, ore will be packed down to the Columbia river and shipped out for reduction. These gentlemen think that ore is worth more at reduction works than on the dump, and propose to make their claims self-developing. Capt. Armstrong of the Kootenay Mail Line has made a uniform rate for ore from any landing on the river to Golden. The rate is $1.50 a ton.

PORCUPINE CREEK.—Foreman Henderson of the Donald Co. writes from the creek to-day: "The Discovery Co. working four men have struck a rich streak of ground, and expect at least 30 ounces in their next cleanup. Our bedrock shaft is going down as rapidly as two shifts can send it." Twenty-four men are at work on the creek.

COLORADO.

NOTES.—Georgetown *Courier*, June 29: The Lamartine mine has paid over $110,000 since January. Work has been resumed on the Centennial mine. The shaft, we hear, is to be sunk an additional hundred feet. A contract has been let on the American Eagle in Peru district to drive the middle level ahead. Woodward & Hartzell's concentrating works are running on cobbings from the Joe Reynolds mine. The mineral is very hard and in the crude contains about 12 ounces of silver to the ton. Six tons are concentrated into one, the concentrates running about 60 ounces. The Deming, an old location on Republican mountain, just above the Astor trail and almost in the town limits, is being worked by G. W. Hall and Le Neve Foster. In the breast is from 8 to 18 inches of mineral. Three wealthy Eastern men were in town Tuesday, making preparations to take hold of one of the most famous mines we have and proposing to sink the shaft some 500 feet deeper. The streak of ore in the old Burrell shaft still continues down. A specimen assayed a few days ago returned 14¾ ounces gold, 152 ounces silver per ton and 10 per cent copper. Mr. West is grading about the shaft for the plant of machinery and is making a road to it to connect with the old Leavenworth mountain road. Charley Veach has great faith in the Double Header lode on McClellan mountain, and from present appearances his faith is going to be rewarded. He has opened up several inches of quartz sparkling with silver glance, and in much of the glance is seen particles of free gold as large as pin heads.

DAKOTA.

CHLORINATION WORKS.—Deadwood *Pioneer*, June 29: Operations suspended temporarily during repairs to the flume by which water is furnished, resumed yesterday. Contract has been made with the Ruby Bell to furnish a quantity of ore, first installment of which "Red" Forrester reports was forwarded to the works yesterday.

BACK FROM THE RESERVATION.—Jack Gray and Jack McAleer returned yesterday from an expedition to White river on the Indian reservation. The trip was induced by fact that Bill Gay, who has some promising coal locations 30 or 40 miles beyond the short range of hills through which the White river winds its way, brought into Spearfish last February $110 worth of gold, washed out on the river's banks. McAleer went down, ostensibly to hunt, but really to prospect, a week or two after. Indian police followed him so closely he was compelled to hunt game, and was not permitted to linger long enough to look for gold. This obstacle may have stimulated desire. At any rate, ever since his return, the purpose of again going back has been firm. Gray was induced to go along. The two and the two Welchs have passed a pleasant ten days camping out. Their time was otherwise thrown away, and no gold was found, and no such indications discovered as will spur any of the party to hasten back to the reservation again.

PROSPECTING.—Judge D. McLaughlin, R. G. Anderson and Peter O Neill returned yesterday after ten days most agreeably, and it is hoped profitably spent, in prospecting a hitherto neglected portion of the hills. Starting from Deadwood on June 16th, the party, joined at Spearfish by Geo. S. Jackson and Pat Donohue, went first to Bear gulch, and therefrom back to Spearfish creek, where most of the prospecting was done. Everything that looked promising was examined, and before start was made for home the wagon was heavily laden with rock, properly labeled to locate place from which it had been taken, which was brought for assay. It is anticipated that returns will show that the rock is valuable in silver if valuable at all.

IDAHO.

ELMORE COUNTY MINES.—Idaho *Statesman*, June 22: The Kentuck, Champion, Rover and Chieftain mines, owned by H. W. Barry, are 2½ miles from Lime creek, 35 miles northeast of Mountain Home, and 32 miles from Rocky Bar. From a prospect these have been purchased and opened up as a mine by Mr. Barry. The ore shoot has been opened for 400 feet, with a crosscut of 14 feet, without finding the footwall. A main shaft has been sunk 37 feet, and every foot shows up better than the preceding. Over 20 assays have been made of the ore, and show an average yield of $85 to the ton; although assays have been made that yielded $420 gold, and $80 silver, to the ton. The pay-streak of ore runs over 24 inches. The country formation is granite and porphyry. From all tests and assays the mine promises to yield a rich return. The situation is greatly in its favor. Lime creek, but 2½ miles away, furnishes an abundance of water for stamp-mill and concentrators, while plenty of fir is close at hand for building. The roads to and from the mine, either to Mountain Home or Rocky Bar, are natural, and need no expenditure. J. H. McGinley's prospects, Jumbo and Hercules, on Lime creek, near H. W. Barry's Kentuck, show a handsome development of free-milling ore. Two assays show an average of $78. The vein, as near as can be indicated, is 20 feet, with pay streak of four feet. The ledge crops out for 1½ miles, and promises to be the basis of extensive future operations.

WOOD RIVER.—Ketchum *Keystone*, June 29: The recent discovery of an immense body of galena in the ground of the Sunday mine, where, perhaps, hundreds of experienced prospectors have trodden within a few feet of riches, is additional evidence that the Wood River country practically remains to be prospected. A mining region that continues to live and pay from $25 to $40 for the reduction of every ton of ore it markets, must have exceptional mineral wealth. The universal verdict: there are better days ahead. A carload of Silver King ore was shipped by the First National bank yesterday, aggregating in value $3700. Another will be shipped to-day from the same mine. The North Star mine shipped a carload of ore Wednesday and one Thursday. A carload of W. S. Con. M. Co. ore was shipped Monday. The chief shippers from the Upper Wood River country this season are the North Star, Silver King, under lease to Hyndman & Co.; the Solace, leased to Davis & Follis; the Warm Springs Consolidated group, leased to M. Carey; the Mattie, under lease; the Star of Hope, under lease, and parts of the Elkhorn, also leased. A great year for lessees! But this is the true method of development where it must be done without capital. It often succeeds where capital fails.

LOWER CALIFORNIA.

ALAMO, Lower California, June 29: Alamo is sure of another quartz mill within a short time. C. C. Lane writes from San Francisco that he has purchased a complete outfit—engine, boiler, twenty-ton mill and assaying and testing apparatus—and that it will be shipped from San Francisco to-day. The site for the mill is unknown as yet. Mr. Lane represents the Alamo M. and M. Co. The Torres Mill Co. will have their mill running in a few days. A. H. Butler has his mill running night and day, and doing good work. While the International Company are building their road to the pineries they will have probably from 500 to 1000 cords of wood cut for their own use. A number of the best mines are now needing timber before any extensive mining can be done. The windmill is being put up in the plaza and the pipes are about laid for the water system. New leads are being found every day, one especially rich on the north slope of Mount Thomasa. Several very fine specimens were shown from the Montezuma and others, some as fine as any previously discovered. The Bodie, a blind lead in Santa Clara, owned by J. M. Martin, also prospects away up. The Texas, Adelaide, Ulises, Asbestos, Aurora and half a hundred others hold their width and richness so well that it is impossible to tell which will prove the best. The camp is growing richer daily in the amount of ore actually in sight. There is some excitement among the Mexicans over the reported discovery of a large lead of native silver somewhere in this district.

MONTANA.

IN A PROSPEROUS CONDITION.—*Mining Review*, June 27: The mining industry of Montana was never in a more prosperous condition. Every week a number of new and rich discoveries are being made in different sections of the Territory. The developments this year will exceed those of all previous years, at the least calculation, seventy-five per cent. The product of Montana mines last year in gold, silver, copper and lead far exceeded that of any other State or Territory by several millions of dollars, and it is confidently anticipated that this year's product will step up several millions higher. The mines of Helena, Butte, Philipsburg, Marysville, Jay Gould, Drum Lummon, Bald Mountain, Neihart, Barker, Castle, Maiden, and in fact all the mines that are being worked are growing richer as the work progresses. The shortage of snow on the mountains and the absence of the usual spring rainfall has stopped placer mining to a great extent, but this will be more than made up for by the increase in quartz mining. As an indicator of the growth of the mining output the Helena smelter in the past week has added another stack to its already extensive works, and a fifth will soon be demanded.

GOSPEL MOUNTAIN.—*New Northwest*, June 29: Fourteen miles south of Deer Lodge lies the Oro Fino mining district. Hundreds of locations have been made there and others are daily being taken up. The locality has long been regarded with favor by prospectors, but it is only within a comparatively recent time that the mineral wealth of the region has been demonstrated. Saturday last the writer made his first visit to Gospel mountain, on which the more prominent leads of the district are located. The fame of the Champion mine is now attracting attention at home and abroad. The face of the east level shows a body of brittle silver and ruby 12 feet wide. The ore body opened so far has a width of from 4 to 14 feet. The formation is granite and the walls are well defined. There is a mountain of rich ore there and the Champion workings are in the pay streak. The Gospel Mountain Co. is sinking a double compartment shaft, which was down 90 feet Saturday. The shaft is expected to cut the vein at a depth of 200 feet by August 1st. Work is progressing steadily on the shaft being sunk by the American-Ruby Co

NEW MEXICO.

LEASED.—Silver City *Enterprise*, June 29: George Batters has leased the Hobson's Choice group of mines at Bullard's Peak. A strike of some importance was made last week by Paul Curtis and Abner Enoch, leasors on the Old Man mine at Fleming. The ore is a hard gray quartz, and apart from being rich in silver and carries considerable gold. The final payment was made by the Deep Down people last week on the Wagner mine, and the title of property passed. A fraction situated between the Deep Down and the Wagner, owned by F. Bell and E. D. Perkins has also been purchased by the Deep Down company, which is now in splendid shape for extensive operations. The company has plenty of funds in the treasury to carry on the necessary developments, while the mine is showing plenty of good ore, and the mill is running with good results. Postmaster E. M. Young, elated at the development work of Mitchell, Walton and Poloxfen on the Tecumseh property at Telegraph, has concluded to try it once more. He sent men out last week to work on his claims which adjoin the company's ground, and as the find is pitching towards his ground he has every confidence in being able to catch on.

PINOS ALTOS.—The new ore in the Continental holds out, and it is probable that a mill run will soon be made. Fox & Co. are driving work with all possible speed. A new vein on El Dorado No. 2, recently uncovered, shows fine ore. The streak is fifteen inches in width, and careful prospecting places a value of $35 to $45 per ton. Osborne & Co., the owners, are opening up and developing this hitherto unknown vein of their valuable group. The Esperanza, belonging to Tolbert & Co., on the south side of the ridge, is developing handsomely. A radical change for the better is noticeable in the Gold and Silver Ribbon adjoining the celebrated Mountain View on the east. The south drift has increased several dollars per ton in value in the last ten feet.

UTAH.

PURCHASED.—Park *Record*, June 29: The Woodside Mining Co., lately incorporated, purchased the early part of the week of the leasers, Messrs. Drake and Wilmans, all of their interest in the lease of the property and also their interest in the second-class ore on the dumps. This places the company in entire possession of the property and they will at once develop the same and open new bodies of ore. As the Woodside bonanza is now a daily producer it will pay dividends from the start. While the terms are private it is said that the price paid the leasers was $50,000.

THE KERR GROUP LEASED.—John Farish has obtained a lease on the Kerr group, situated southeast of the Ontario and adjoining the Lowell and Parley's Park properties. It is an old property of considerable merit and Mr. Farish proposes to develop it to the best possible advantage and make it produce ore ere long. The group is owned by Messrs. Kerr & Reich of Salt Lake.

AT THE CRESCENT.—Stewart Stephenson has tendered his resignation as general superintendent of the Cresecnt, and has been succeeded by J. R. Nichols of the Salt Lake, vice-president of the company. Foreman Gitsch has been succeeded by Jno. C. King at the mine.

ALLIANCE TUNNEL.—The middle of the week a small vein of ore was encountered in the Alliance tunnel at a distance of about 250 feet from the mouth. It goes well in silver and lead and runs into the Massachusetts Company's ground and also a claim owned by Ferry and Lundin.

MECHANICAL PROGRESS.

The New Process for Softening Steel.

The new process for softening steel known as Dalzell's process, has recently been brought into practical use, and seems to be attracting much attention because of the remarkable softness produced. It is said that by this process any of the ordinary steels, of the usual lengths and shapes, for making machine tools, punches, and dies, will, when treated, become so soft as to effect a most material saving in the cost of making the desired tool. After having been softened and cut to the required form, the steel is handled in precisely the same way as any of the well-known brands, such as Jessup or Black Diamond. It is claimed that the process, which is kept secret, affects in no way the chemical composition of the metal, but so alters its physical structure as to impart the qualities mentioned. A piece of Jessup steel which had been softened by this method was taken to the Stiles & Parker Press Co., who made a punch to cut a five-pointed star seven-eighths inch in diameter and unusually sharp at the points. According to the instructions given, the punch was to be made and then tested by the Stiles & Parker people. In the making of this punch they saved about 20 per cent in the cost, owing solely to the softness of the metal. After having cut it, they tempered it in the usual way in water. The punch was then forced through German silver 3.32 inch thick, and through wrought iron 3 16 inch thick, and as a final test was forced through metal which cut only a part of the star, thus giving an unbalanced pressure tending to bend the punch. It was given a series of tests, not only unusual, but which would not be tried except under like conditions, where the manufacturer is instructed to give the tool the severest trial possible, and where, as is natural, he passes from one test to another more severe. The tool came out at last as perfect as when it left the makers' hands.

According to this it seems evident that the process while softening the steel, at the same time so changes it that when tempered it possesses greater strength than the same quality of metal untreated. The process is particularly applicable to die-sinking, where the hub, being of softened steel, can be made in much less time, while the die, also being softened, can be sunk cold instead of hot, as is now the common practice, thus saving time and labor. The die is then tempered and hardened in the usual way. It is claimed that this process changes what we might name the final quality of the metal, so that its strength in high grades is increased at least 25 per cent. In handling the steel during the making of any tool, it is absolutely necessary to perform all operations cold, as the heating of the metal destroys the qualities imparted to it in the softening process. After having been treated, the steel can be forged cold, can be twisted or bent in a way it would not stand before treatment, and can finally be tempered as desired. Any of the well-known brands of tool steel can be subjected to this process, and can afterward be treated in the usual way.

ECONOMY IN OIL.—A number of years ago a certain man took the contract to furnish oil, waste and brasses for all of the coal cars on a trunk line. He believed that the best was the cheapest. In all his purchases, therefore, he bought only the best of supplies. He attended to the business in person, and throughout the whole time of the duration of his contract not a train was delayed by a hot-box, while the standard train hauled by the locomotives in the service rose from 14 to 19 cars. Unfortunately for the railroad company, he made money out of the job, and the purchasing agent found it out. This wily official therefore persuaded the railroad authorities that what man had done man could do, and that the company could purchase its own supplies and save the profits of the contractor. So when the contract expired it was not renewed, and the era of cheap oils and waste once more set in. As a result, in less than three months, or as soon as the old oil had all worked out of the boxes, the length of train hauled dropped from 19 cars to 14, and the cost of oil and waste had risen above the figure paid to the contractor. Here was a case of a direct loss to the company of over 26 per cent in the hauling-power of its locomotives, due entirely to a difference in the grade of oil used. The reader will readily understand that this will compensate for a vastly greater difference in price. In each case the engine was doing all the work of which it was capable, therefore the consumption of coal remained the same. The company lost 26 per cent in crew wages, and the increased cost of oil, but the purchasing agent had the satisfaction of knowing that he was paying the bottom prices for supplies. It can hardly be asked whether it paid the company to disregard such a purely theoretical matter as the coefficient of friction of the oil it was using.—*National Car-Builder.*

CHAIN CABLES.—Messrs. Bradlee & Co. of Philadelphia are making chain cables for the Government, under the new formula determined by Lieutenant Mackenzie. The breaking resistance must be one million times the square of one-fourth the diameter, or for a two-inch cable, 250,000 pounds. The terms of contract also require the testing of the entire cable to one-half the breaking load, and a breaking test of three links taken at random. The requirements were heavier than those hitherto laid down, and only one tender was received. Tests already made from a completed cable show an excess of nearly 10 per cent over the breaking strength required.

Iron Buildings.

Iron buildings in many respects offer advantages that are possessed by no other material. There is, of course, nothing new in the idea. Every one is familiar with iron as a part of the material entering into house structure, and occasional cases are called to mind where small structures have been constructed exclusively of corrugated iron so far as the covering is concerned. But of late, according to the English papers, a great step in advance has been taken in bringing iron more prominently into use for house construction, and especially for such purposes as farm outbuildings, stables, shooting-boxes, lodges, cottages and small houses it is without doubt the material *par excellence.* Messrs. Bruce and Still of Liverpool are probably the largest manufacturers and dealers in the kingdom. They are constructing iron houses for almost every purpose, from a billiard-room to a shooting-box, and have orders from all parts of the world. They have constructed iron buildings which are highly artistic in design and wonderfully cheap. As an instance may be mentioned that a billiard-room, for which a London house sought to charge $250, Messrs. Bruce and Still can supply at about one-half that price. It is hardly necessary to say that the iron is corrugated and galvanized, whereby strength is secured and oxidation prevented.

A very favorable account is also given in the French papers of the new system of building houses of iron and steel plates, introduced into France by M. Danly, manager of the Societe des Forges de Chatelneau, who has set forth its various advantages in an interesting and plausible manner, attracting considerable attention. M. Danly has satisfactorily ascertained that corrugated sheets, of no more than a millimeter in thickness, are sufficiently strong for building houses several stories high, and the material used allows of quite a variety of architectural ornamentation. The plates thus employed are of the finest quality, and, as they are galvanized after they have been cut to the sizes and shapes required, no portion is left exposed to the atmosphere. It is asserted that houses constructed in this manner are very sanitary, and that the necessary ventilating and heating arrangements can readily be carried out.

An Interesting Marine-Engine Trial

The English correspondent of the *American Manufacturer* gives a very full account of the first marine-engine trial carried out on any large scale at sea for any great length of time, in which the feed-water was measured and the coal weighed throughout the trial. The trials were made upon the steamship Meteor, a vessel belonging to the London and Edinburgh Shipping Company, and fitted with the most approved triple-expansion engines, with two double-ended boilers and twelve furnaces.

The object of the trial was to measure the coal, water and indicated horse-power as accurately as possible and over as long a period as possible. The Meteor's length between perpendiculars is 261 feet; registered tonnage, 692; gross tonnage 1223; underdeck, 958 The displacement or trial was 2090 tons, with 15 feet 1½ inches draft. We condense briefly as follows:

The coal used was 4005 pounds per hour. The average temperature of the feed water was about 165° F. The average revolutions were 17.78 per minute. The main boiler pressure was 145.2 pounds. The evaporation was 7 46 pounds per pound of fuel. The ratio of heat turned into work was almost exactly 10 per cent. The mean speed was 14.6 knots.

The Value of Triple Expansion

Was strongly confirmed by these trials. The performance of the triple engines on the Meteor was better than is generally claimed for this type of engines even by manufacturers, and if the coal used had been better, doubtless the boilers would have given results even more satisfactory than those which were attained. A separate committee of the Institute is engaged, it may be remarked, upon investigating the benefits of the steam jacket in cylinders generally, and is paying attention to the results accruing from heating the jackets by steam and by heated gases respectively. Marine-engine trials were never more valuable than at present. The development of marine engineering is rapidly progressing at this time, and is a matter of constantly increasing importance to all commercial nations.

STEEL BOATS.—It is stated that hereafter the boats to be carried by Atlantic steamers instead of being made of wood will be made of steel in one piece. Wooden boats rot and are easily crushed. The new boats will be built by machinery especially made for rolling them out in all sizes in a single plate.

THE POSSIBILITY OF AIR-SHIPS.—The small weight of an aluminium engine, driven by compressed air, gas or electricity, compared with its iron equivalent, undoubtedly makes the ultimate success of air-ships more probable than before.

SCIENTIFIC PROGRESS.

THE MYSTERIES OF VISION.—Emil Sorel, in *La Nature*, says: "There are days on which, in certain weather, and despite the curvature of the earth, the distance of visibility is doubled, or more than doubled. This phenomenon is explained to us by a well-known law of physics. If we throw a coin into an empty vessel, it will be hidden by the edge of the latter, at a certain distance; but if we fill the vessel with water, the coin will become visible. We have here a case of refraction, such as is explained in elementary works on physics. Every one also knows the theory of the mirage put forth by the celebrated Monge, who explains the phenomenon as due to a diminution of the air's density in contact with the superheated earth. A contrary theory will explain the mirage at sea. While the sun is making the atmosphere intensely hot, the sea and the strata of air in contact therewith remain relatively cold, and these strata become superposed in the order of their density. A luminous ray emanating from the sea will pass from one stratum into another of less density, there will be a refraction, and an object beneath the horizon will be seen above it. This theory supposes two conditions, to wit, a heating of the atmosphere, while the sea and the earth remain relatively cold, and a calmness of it to permit its strata to become superposed in the order of their density. It is precisely when these two conditions are fulfilled that the phenomenon of the mirage occurs. On such days ships rise instead of descending in measure as they recede. As the horizon is perceived by direct visibility, a ship is finally seen above the horizon as if it were suspended in the air. It is the famous 'phantom ship,' familiar to sailors—a visible ship in its natural upright position. If atmospheric conditions were favorable, a second ship would be seen above the first, etc. Certain mariners worthy of credence have assured me that they have seen as many as seven superposed ships."

THE LATER DEW THEORY.—It is now held by the best physicists that instead of falling from above, the dew rises from the earth. The generally received opinion that the dew is formed of vapor existing at the time in the atmosphere, must be given up for the established fact that the vapor which rises from the heated earth is trapped by the cold surface earth. Besides, when we imagine that, on a cold evening after a sultry day in summer, our feet are being wet by the dew on the grass, we make a grave mistake; for that moisture on the grass is not dew at all, it is false dew—in reality the transpired humor of the plants. The drops at the tips, which glisten diamond like, are not dew; close examination shows that these crystalline spheres are situated at all the points where the veins of the leaves cut the outer edges. These drops only give evidence of the vitality of the plant. The difference between the true dew on the grass and the exuded drops through the veins from within the grass can be easily distinguished; for the former is distributed all over the blade in a moist film, whereas the latter are of some size and are situated near the tips of the blade. Altered, then, is the meaning of the line, "Ilka blade o' grass keeps its ain drap o' dew;" for those brilliant globules on the petal, shaking to the same sweet air, and often "gliding at once all fragrant into one," are not dewdrops, but are the exudations of the healthy plants. They give evidence of the *elixir vitæ* of vegetation; whereas the true dew is the pearly luster, varnished in filmy humidity over the blades by that wondrous alchemy which transforms the water vapor rising from the ground into the plant-refreshing dew.

CRITICISM OF SCIENCE.—Men of science may, as individuals, fall into many errors. They may fail to realize the true dignity of their calling; they may be unduly swayed by party spirit or by personal aims; they may be unworthy ministers of the truths which they deliver. But science, what is it but truth? To all who are dissatisfied with the present currents of thought we would, therefore, say: "Criticise men as much as you please. Point out their errors, their failings, intellectual and moral, with all needful severity. Hold up the standard by which you think their lives and thoughts ought to be governed. Criticise theories, too. Let nothing pass unchallenged or unscrutinized that you are not satisfied is true. Let no glamour of great names, no popularity of certain modes of thought, deter you from expressing your dissent from what you do not believe. But do not put yourselves hopelessly in the wrong by attacking science, or by abusing the scientific spirit. You will gain nothing by it, but will merely darken your understanding and shut yourselves out from the light that is ready to lighten every man that comes into the world. Science will abide. It has its roots in the everlasting rocks, and draws its aliment from universal nature. The scientific spirit will abide, admonishing men of their errors and leading them into all truth. It is wise to be reconciled to such powers as these; even now while you are in the way with them make terms of peace and find rest to your souls."—*Popular Science Monthly.*

PHENOMENA OF COLOR.—Contrary to what has been the general opinion, a recent writer on the nature and phenomena of color asserts that its causes and effects are determinable solely by the wave theory of light, that color depends, in fact, upon the number of light waves reflected from any object impinging upon the retina of the eye. According to this theory, there are in red about 40,000 waves to the inch, and these will strike the eye at the rate of four hundred and forty-seven millions of millions of pulsations per second; in violet there are 57,000 waves to the inch, and six hundred and ninety millions of millions of pulsations per second, the other colors having wave lights intermediate between these two. From this the conclusion is arrived at that color does not really exist either in the object or in the mind or in the brain of the observer, but it is an effect. This, it is thought, may be illustrated by the fact that there can be no appearance of a fire on a desert island where there is no eye within seeing distance; the chemical process known by the term combustion goes on, but there is no appearance of the flame save when its light waves strike upon the retina of the eye.

INGENIOUS ART PROCESS.—The name of pyrogravure is that of a new and ingenious method of engraving in black, reddish-brown, bister, etc., by the use of a red-hot metallic point, the operation being as easy as that of drawing with a pen or pencil, a scraper and some gum serving to suppress or lighten the lines upon wood, just as upon paper. The instrument used is a burner, which is kept at incandescent heat for an hour or more by a charged gasometer of compressed carburetted air, which is easily regulated and kept at any desired point of heat, so that the draftsman has nothing to think of but his work. It is claimed by the inventor, M. Perier, that both art decoration and industrial ornamentation have in pyrogravure a new means of utilizing the talent of the artist and the skill of the workman, it being as practical by this means to draw a portrait or landscape as to decorate a room, a piece of furniture, or any other object, or to mark the handle of a tool. The lines produced by this method have not the same degree of sharpness characterizing those given on wood by the graver or gouge; but it increases the decorative effect of marquetrie and of objects of wood or leather inlaid with metals, ivory, mother-of-pearl, etc. Binders, cabinet-makers, toy manufacturers, etc., can resort to this system with advantage for the cheap ornamentation of their products; in a word, anything capable of being carbonized, or modified by the action of burning, can be ornamented by this process.

IS THERE ANYTHING NEW UNDER THE SUN? It has been discovered that the idea of the "drop a nickel in the slot boxes" is older than Christianity. In the Egyptian temples devices of this kind were used for automatically dispensing the purifying water. A can of five drachmæ dropped into a slit in a vase set a simple piece of mechanism like a well-sweep in motion, a valve was opened for an instant and a portion of the liquid was permitted to escape. The apparatus is described in the "Spiritalia" of Heron of Alexandria, who lived 200 years before the Christian era, and is illustrated in the sixteenth century Latin manuscript translations of his work, in which, by the way, is also delineated the Egyptian fire engine of the author's day, with its double force-pump valves, lever arms, goose neck, and probably, too, air chamber—but this is a mooted point—which form the essential feature of the machines of the nineteenth century.—*Fire and Water.*

NEW MODE OF TRANSMITTING FORCE.—M. Sayers, a French engineer, is the inventor of an apparatus for transmitting force between bodies moving at greatly varying velocities without the accompanying disadvantage of a violent collision. The plan consists in furnishing the contact surface with steel brushes, which, by the entanglement of their "bristles," are enabled to grip one another. In this way, it is found, the swiftest motion may be imparted gradually to a perfectly stationary body. The object in this device is, chiefly, the requirements of quickly moving lifts, railway trains and other bodies moving at high speed and with great momentum; and the importance of this can hardly be overestimated, as, for example, in the production of an effective brake, or in obtaining an automatic working of railway signals.

SUPPOSED TIDES IN THE EARTH.—Some 20 years ago, Herr Faib, an Australian scientist, first suggested the possibility that the moon may act upon the great ocean of molten matter beneath the earth's crust exactly as it acts in producing the tides of the external ocean of water. He now considers that the reality of such action is proven, and that the earth's crust is severely strained, and more or less warped and broken, at the times the theory would indicate. It is during the periods of greatest strain resulting from the moon's attraction that earthquakes appear to be most likely to occur, and that gases seem to be forced into coal mines to such an extent as greatly to increase the explosions.

CASTING WITHOUT SAND.—A Wakefield foundryman's patent is said to abolish sand in casting pipes. "In superheated steam or gas-jacketed metal molds" pipes are cast which are uniform, sound and true, as if turned or bored by a lathe. The pipes so cast are not porous, and they have other excellent qualities, it is said.—*Glasgow Engineer.*

CANAL BUILDING in France is crowding the railroads to the wall.

GOOD HEALTH.

A NEW SYSTEM OF WATERPROOFING.—It is well known that waterproof garments are objected to because they are impervious to air, the result of the coatings of india rubber and other non-porous substances which are applied as a film over the textile base of the cloth. This film is liable to break and shell off, thus putting an end to the waterproof character of the garment, and admitting air as well as water through the interstices between the warp and the weft. It is found also that with systems which close up these openings the penetration of water is only temporarily impeded, as it adheres readily to the other surfaces of the cloth which absorb the water driven away from the covered spaces. The great requirement is a fabric which, while allowing all excessive heat to escape from the wearer, shall at the same time prevent moisture from passing through. This is said to have been accomplished by Messrs. W. H. Craven & Co. of Bradford, England. Specimens of cloth prepared by this process, when placed under water, do not absorb that liquid, but it flows from its surface much in the way that water passes from the proverbial duck's back. Examination shows also that these textiles are permeable to air, the spaces between the threads being as free to the passage of air as in ordinary cloth. Cotton, wool or silk is treated by this process. While passage is free to air, water will not pass through except under pressure or when forced violently against the fabric. The color and appearance of the material is not affected by the treatment. The important feature is found in the fact that the material treated is impervious to rain, but not to air. Hence a light hygienic and elegant waterproof garment can be made whose folds fall perfectly natural, with color and texture fully preserved.

TO CURE BALDNESS.—A few words about one of the most common forms of skin disease among us. Baldness is so widely spread and universal among us that it is quite fashionable. Nevertheless, I shall give a couple of recipes for that form that is accompanied by fall of dandruff, which is technically known as dry seborrhea of the scalp. In nine-tenths of these cases a cure is possible; that is, hair may be restored if sufficient patience is allotted with other treatment. Owing to barbers' failure to give back to a man his hair, a general impression exists that there is no use to try; once bald, always bald. This is scarcely ever true of seborrhea, not in 50 per cent of cases from other causes, and whoever will try these recipes will be convinced of their efficacy. For a week, at the outset of treatment, the scalp is to be thoroughly washed with a reliable tar soap, such as any apothecary sells, drying the hair thoroughly, but not rinsing out the tar. If hair has vanished, let the lather dry upon bare spots. Then begin with a wash compound of resorcin pure, one dram; castor oil, one-half ounce; bay rum, 7½ ounces. Mix. This is to be applied morning and night, and well rubbed in. After two weeks of lotion, have the following pomade prepared, and rub into the scalp and hair a portion the size of a hazel nut every morning: Salicylic acid, ten grains; ammoniated mercury, five grains; cold cream, one ounce. Mix. After one week's careful attention to this treatment the bald spots will be covered with a fine, thick, silky growth, that is forerunner to a crop worth having. Try it. *American Magazine.*

SMOKER'S HEART.—Within the past 20 years the medical faculty has come to clearly comprehend and to accurately diagnose a disease which they now denominate as "smoker's heart." Excessive smoking, whether by pipe, cigar or cigarette, affects the action of the heart and disturbs the circulation. The pulse will intermit—not with any regularity—sometimes one beat in four, sometimes one in ten, sometimes two or three at a time, and then comes trouble. The brain, missing its regular pulsations of blood, wavers, the heart flutters, and then follows a temporary collapse. Strong cordials are indicated. Strong coffee is good—strong spirits better. *But the remedy,* too often relied upon, *is as bad as the disease;* and the subject grows slowly worse. Angina pectoris is said to sometimes result. One of the leading physicians of this city relates a case in point. A patient suffering from "smoker's heart" believed that he had a chronic heart disease, and came for a careful examination early in the day—before he had eaten any breakfast. The stethoscope showed the heart to be sound as a dot—he had not smoked for 12 hours. Greatly relieved at the verdict, he lighted a big black cigar, and sat smoking upon an empty stomach, while he talked. In a few minutes, as he rose to go, his feet failed him and he fell in a momentary faint. The heart was fluttering wildly, but yielded at once and resumed its normal action after a strong stimulant.—*Cincinnati Enquirer.*

TOOTH DRAWING AGUE.—"It's queer the way people are affected by visiting a dentist's office," remarked a dental surgeon to a Pittsburg *Dispatch* reporter. "Some no sooner come here than they seem to be seized by a sudden chill which sets them to shivering all over. They get in the chair and I turn on the natural gas to make as much heat as possible. Why, I've even had to put blankets around my patients to keep them comfortable on a warm day. Others are thrown into a feverish state, and the perspiration breaks out the minute they sit down. Then of course I have to shut off the fire. But the strangest thing about both classes of patients is that their chilliness or feverishness leaves them immediately after they quit the chair. It is nervousness and dread that cause these remarkable physical effects, I suppose. But it's about as hard on me as it is on them, for the unevenness of temperature in the operating-room, which I must perforce endure, keeps me suffering from a cold, catarrh, or headache about half of the time."

PHYSIOLOGY OF PLEASURE. — The question has often been asked as to what constitutes the greatest pleasure, and who is the happiest man, but it is obviously one that does not admit of solution. The intensity of the pleasurable sensation is a matter of temperament and surroundings, but *cæteris paribus*, the happiest man is he who possesses the greatest sensibility, the most powerful imagination, the strongest will and the least number of prejudices. The men are rare who can, by an effort of the will, arrest the oscillations of sorrow and allow only chords of pleasure to vibrate. Pleasure is the mode of sensation, never the sensation itself, and it is not a paradox, but an incontestable physiological truth, to say that no pleasure exists which is essentially or necessarily a pleasure. The ideal of perfection in humanity would be to efface pain from the list of sensations, and to give all men the maximum number of pleasures. All the rest, as the philosopher said, is but dream and vapor.

A PECULIAR BIRTHMARK.—Joseph H. Rotherman, a carpenter of Connellsville, Pa., has on the back of his neck a birthmark, crescent in shape and bluish in color. When the moon is turning its first quarter, the mark becomes reddish and begins to swell. As the moon grows older the mark becomes redder, and the flesh swells correspondingly. When the moon is full, the crescent on Rotherman's neck is bright red, and the flesh assumes a horn-like roll, over two inches in thickness at the largest part, gradually tapering to a point on the shoulder. As the moon wanes the mark decreases in size and color until it again becomes a bluish crescent-shaped mark.

CREMATION A FAILURE.—Cremation is apparently a failure in Philadelphia. The crematory in that city is said to be the largest in the world. It has been in-operation since May, but thus far the receipts have not equaled the expenses, while the price of incineration has been reduced from $50 to $28. The Philedelphia *Times* states that, notwithstanding the reduction, "an order has not been received for three weeks." Still the president of the enterprise declares that he is not discouraged.

USEFUL INFORMATION.

The Evolution of the Piano.

The piano, as we see it to-day, is the growth of centuries of invention. In its infancy it was a harp with two or three strings. From time to time more strings were added, and after awhile the cithara was born. The cithara was in the shape of the letter P, and had ten strings. It took many centuries for musicians to get the idea of stretching the strings across an open box, but somewhere about the year 1200 this was thought of and the dulcimer made its appearance, the strings being struck by hammers. For another hundred years these hammers were held in the hands of the player, and then a genius invented a keyboard, which, being struck by the fingers, moved the hammers. This instrument was called a clavicytherium, or keyed cithara. This underwent some modifications and improvements from time to time. In Queen Elizabeth's time it was called a virginal. Then it was called a spinet, because the hammers were covered with spines of quills, which struck or caught the strings of wires and produced the sounds. From 1700 to 1800 it was much enlarged and improved, and called a harpsichord, and this was the instrument that Lady Washington, Mrs. Hamilton and the fine ladies of our revolutionary times played on.

In 1710 Bartolomeo Cristofoli, an Italian, invented a key or keyboard, such as we have now substantially, which caused hammers to strike the wires from above, and thus developed the piano. In the past 150 years there is no musical instrument which has so completely absorbed the inventive faculty of man as the piano. At the present day the upright piano has the field almost entirely to itself, and has reached such a high grade of perfection in shape, tone and appearance that there would appear to be no possibility of further improvement.—*Musical Courier.*

HOW TO CLEAN GLASS WELL.—Two servants employed in adjoining houses were talking recently about their methods of cleaning windows. The one whose windows always looked the brightest said she selected a dull day for the work, or a day when the sun was not shining on them, because when the sun shines it causes them to be dry-streaked, no matter how much one rubs. The painter's brush is the best article for this purpose, then wash all the woodwork before the glass is touched. To cleanse the glass, simply use warm water diluted with ammonia; don't use soap. A small stick will get the dust out of the corners, then wipe dry with a piece of cloth—do not use linen, as the lint sticks to the glass. The best way to polish is with tissue paper or newspaper. To clean windows in this way takes much less time than when soap is used.

WHITE PITCH.—An important invention has recently been made in England which will be extensively used in connection with shipbuilding and the efficient maintenance of ships, and is brought to notice by Mr. William Wells, chemical manufacturer, Leith, in the form of white pitch or calking-glue. This material meets the demand which has so long been open for a white instead of a black pitch; one, moreover, which can be melted and run into the deck-seams in the same way as ordinary pitch, and which will do away with the laborious and expensive method of forming white seams with putty. The new material, known as white calking glue, is offered as the result of a series of experiments which have at last enabled Mr. Wells to produce a white pitch possessing the various qualities required for calking purposes; viz., strength, a safe melting-point, adhesiveness, and the property of melting into a thin liquid without frothing. Used in the same way as ordinary pitch, it is free from the odor characteristic of tar, and it is pure white in color. It makes a sound seam, is easily applied, and cheaper in use, we are informed, than white lead putty, as it has three times the bulk of the latter. For the better class of ships, and especially for yachts, the invention is of much importance, on account not only of the improved appearance it presents on a well-kept deck, but for the greater durability which its use insures. The material has already been extensively adopted by ship-builders, and has lately been used on two of the finest steamers afloat—the Inman liner City of Paris and the White Star liner Majestic, which is famous as the longest vessel in the world.

DOG BISCUITS, ETC.—The production of prepared foods for domestic animals may be considered as an entirely modern industry which has been developed within the last twenty-five years. Mr. Spratt was one of the first to turn his attention to the preparation of these substances, and his first production was a clean, cheap and nourishing dog food. Since then, other branches have been added to the business, and at the stand of Spratt's Limited specimens of food for poultry, pigeons, horses and cattle, as well as the famous dog biscuits, may be seen. These latter are made from the fibrine obtained from American beef, combined with Scotch oatmeal, wheat, flour, dates and beet-root. Apropos of this last-mentioned ingredient, it may be stated that it was found to be the only vegetable which does not lose its peculiar properties under the baking process which, involves a heat of 700 degrees in the oven. Even under the influence of such a heat as this, it takes nearly forty minutes for the tray of biscuits to pass through the oven, which is ninety feet or about thirty meters in length. The average quantity of fibrine dog-cake which is thus manufactured at the firm's works, at Bermondsey, London, S. E., amounts to about 200 tons per week. The biscuits are famous throughout the world, not merely as a food, but also as a valuable preparation calculated to preserve dogs in good health.

CHEAP SOLUTION OF ZINC.—It is stated that a New Englander has recently discovered a cheap method of dissolving zinc by combining it with hydrogen, and producing a solution called zinc-water. This liquid, if applied to certain woods, notably whitewood, makes it absolutely fireproof, and at a low cost. Mr. Edward Atkinson, the Boston economist, in speaking of it at Cornell University, says he regards this discovery as one of the most important of the age, and one that will surely revolutionize fire insurance, as well as immensely decrease the losses by fire. The invention is kept secret for the present. Sir Lyon Playfair, the English scientist, corroborates all that is claimed for the invention, and says that the inventor has a faculty of blundering into the choicest secrets of Nature's laboratory. As soon as patents are perfected and capital interested, zinc-water will become an article of commerce.

THE PROGRESS OF AGRICULTURAL SCIENCE has received a valuable acquisition in the Seventh Annual Report of the Board of Control of the New York State Agricultural Experiment Station at Geneva. The report comprises 428 octavo pages, and is replete with information most valuable to agriculturists, not founded on mere theories of *savants*, but resting upon actual experiences, with notations of variety of soil, atmospheric conditions, kinds and quantities of manures, etc., and a trustworthy relation of the results attained. These reports deserve a liberal circulation in every agricultural State and Territory of the Union.

THE USES OF SACCHARINE. — Saccharine seems now to be extensively used as a substitute for sugar in syrups and preserves, and even in champagne. This last is a fact fully recognized in commerce. Even as a medicine, saccharine is not harmless. M. Worms says that diabetic patients who use it for a fortnight lose their appetites. M. Dujardin Beaumetz thinks, however, that as a therapeutic agent saccharine is useful in the case of the few diabetics who cannot do without sugar. The *Gazette des Sciences Medicales* thinks there can be no doubt as to the propriety of preventing its general use.

ENGINEERING NOTES.

The American Elevators in the Eiffel Tower.

The construction of the elevators for the Eiffel tower was one of the most difficult problems the builders had to contend with. The elevators had to go up the center of the four columns, and before their junction these columns contain an incline and a curve. The straight part of the tower presented no difficulty; the incline could be got round, as it was not an unprecedented thing to run an elevator up an incline, but no one knew how to make an elevator describe a circle, at least not in France. The American Elevator Co. was prepared to accomplish this novel feat of engineering, but in addition to a strong prejudice in France against foreign contractors there was a stipulation that no foreign material should be used in erecting the tower. After many futile attempts to find native engineering talent which would solve the problem of placing the elevators and not outrage national feeling, the commission had, after all, to fall back on Yankee skill. They did so reluctantly, and then only gave part of the contract to the American company; hence there are three systems of elevators in the tower.

To strike a radius of 160 feet for a distance of over 50 feet required a great amount of preparatory study, and the American company worked on the problem for over three years. The first thing is the motive-power. A cast-iron cylinder, 43 feet long and 38 inches internal diameter, is placed at the foot of the track, and contains a piston which moves up and down. Attached to the piston are Bessemer steel rods 4½ inches in diameter, which are connected at their upper ends with what the French call a chariot, consisting of wrought-iron girders supported on steel wheels, which move up and down with the piston. There are six pulleys in the chariot—each five feet in diameter—and cables pass round these pulleys; at the extreme upper end of the girders there are six similar pulleys, and cables pass round these pulleys in such a way as to form a "tackle" so that the speed of the piston is multiplied 12 times. This arrangement makes the car move 12 feet for every one foot the piston moves. From the chariot the four cables continue, always supported on pulleys, fixed on to an iron framework, down the other side, and are attached to the car of the elevator. The car is a large carriage of two stories supported by an iron framework and fixed on to the big steel wheels.

The carriage accommodates 50 persons, 21 in the lower compartment and 29 in the upper. It moves along an incline of 54° to the first story—a distance of about 185 feet. Then it describes a radius of 160° and continues the inclined route, which changes slightly, from 74° to 78°, to the second story, which is about 420 feet high. Any one of the six cables attached to the car is capable of supporting the whole weight, and there are all our usual safeguards, in case of accidents, adapted to the special construction of the elevator. A counterbalance 12 tons in weight runs on a track behind the car, and is attached to it by two cables. Six cables leave the car—two of them turn over to the right at the top, and are attached to the counterbalance, and the other four to the chariot. All the piston has to do, therefore, is to sustain the weight of the passengers, as the counterbalance lifts the car. The hydraulic pressure is secured from a tank on the second story, to which the water is pumped.—*Ex.*

THE NICARAGUA CANAL.—Now that the Panama-Canal scheme is practically dead, after a wasteful expenditure of a vast amount of money, attention naturally turns to the proposed canal across Nicaragua, which experts claim not only to be possible, but much easier of completion and at smaller expense than the first estimates of the Panama canal. The terminus of the canal on the Pacific is at the mouth of the Rio Grande, where there is a good anchorage. About three miles of the canal from the Pacific toward the lake, will be in the valley of this stream. The remainder of the distance will be mostly dry excavation. The heaviest piece of work on the line is the great divide cut across the San Francisco range. The cut is to be through rock three miles long, with an average depth of 120 feet. There is no record of any rock cut as large. The climate is much better than on the isthmus. The engineers of the company have been there a year and a half under the most trying circumstances, and not one was seriously ill during that time. A construction party is already on the ground and actual work has commenced. A second party left New York June 23d with a large amount of material with which to continue the work.

AMERICAN RAILROAD BUILDERS IN RUSSIA.—It is said that a powerful American syndicate is about to be formed for the purpose of building railroads in Siberia. Besides a large subsidy, the Government will give 4,000,000 roubles yearly for the transportation of mails and convicts.

THE PANAMA CANAL.—It is stated that the Government of Colombia will not renew the De Lesseps grant when it expires in 1892.

Passing Events.

For the first time this season chrome ore has commenced to come into Livermore. About 100 tons are now awaiting shipment. This ore will be sent around Cape Horn to the East. The Alameda county chrome mines would pay much better if the miners could get better freight rates.

The arrangement made by the Southern Pacific Co. for a large coal supply from Vancouver makes a decided change in the coal business of this port. A great deal of the coal brought here has been from Australia, but this new arrangement will stop some of the Australian supply.

There are rumors of wonderfully rich finds in Oro Fino district, Montana, the quartz uncovered being said to be better than that at Granite. Montana is already the largest producer of the precious metals and new developments are constantly being made.

The PRESS is printed one day earlier than usual this week, for Thursday is our National birthday—the anniversary of the Declaration of Independence, which will doubtless be celebrated near and far with the usual explosions of powder, ringings of bells, processions and literary exercises, in which "The Star-Spangled Ban-..." the reading of the Declaration, and the flaps and screams of the American eagle will occupy the place accorded them by established usage. It is the commemoration of an event which has proved of vast importance to the world, and whatever may be thought of methods of celebration the event should never lose its hold upon the patriotic heart.

A State Geological Survey.

The great importance of a thoroughly well made map of this State, which will show its geological and mineralogical features, is recognized, but it has not been made. In the days of the old State Geological Survey a vast amount of information for such a map was gathered, but no such map was made, because the survey was stopped. Even the map of the pliocene rivers, which had been plotted and colored, was not published. Should a new map now be made it would show reservoir sites suitable for conserving water for our arid lands; should indicate the valley, swamp and overflowed lands, the timber lands and all such information.

This subject has been called to our attention by the article No. 5 of J. H. Crossman in this number of the PRESS, treating on Pliocene Channels, wherein he suggests the importance of finishing the work of Major J. W. Powell of the U. S. Geological Survey in connection with that of Prof. Davidson of the U. S. Coast and Geodetic Survey, and State Engineer Hall's survey and map of the State.

We understand that State Mineralogist Wm. Irelan has already taken this matter in hand, and laid out this work; that his assistants have been selected, and the work would have been now in hand had it not been for some technical error in drawing the State appropriation bill for this and other purposes in favor of the State Mining Bureau.

The amount of the appropriation is $100,000, probably not enough to carry out so important a work, but sufficient for a commencement. This money should be available now, and it will be a matter of regret if Controller Dunn persists in withholding the sum appropriated, through a technical ruling with reference to the appropriating Act. It is perfectly plain that the Legislature intended to give the money for the Bureau, and many lawyers have agreed that the alleged faulty wording of the Act is of no moment. If, however, this money is kept back, a good deal of the time in which field work can be done will be lost. It is unfortunate that this misunderstanding should have arisen at this time, since work that should be done promptly is being delayed.

California Academy of Sciences.

The regular monthly meeting of the California Academy of Sciences was held the evening of July 1st. The stated paper of the evening, "Descriptions of New Mammals," was read by Walter E. Bryant, collector and curator of the Academy's mammals. The paper was devoted to the squirrels of our coast, and the following were exhibited and described for the first time: Black-footed Tree Squirrel (*Sciurus fossor nigripes*); Black-capped Ground Squirrel (*Spermophilus grammurus atricapillus*). Great confusion has previously existed in regard to the identity of our squirrels. The complete study which is being given the matter by Mr. Bryant will, no doubt, do much to throw light upon the subject. A member present stated that our California flying squirrels, which are nocturnal in their habits, are peculiarly attracted by white tents, which, if pitched in the vicinity in which they are found, will collect them in numbers, when they will race up and down, from the ridge-pole to the ground, all night long. Hon. J. de Barth Shorb presented the Academy with a reddish-colored petrifaction, supposed to be a section of a species of pine. This gave rise to a discussion of the species of timber composing our petrified forests.

THE Governor has appointed and commissioned C. E. Grunsky of Sacramento a member of the Examining Commission of Rivers and Harbors, vice William Ham. Hall, disqualified by reason of holding a Federal office.

IT is stated that a gas well has been dug 30 miles east of Ukiah, Mendocino county, that sends out 4,000,000 feet of gas in 24 hours. It is proposed to pipe it to the town and use it.

Silver Facts and Figures.

NUMBER 2.

In discussing the silver problem, the fact must not be lost sight of that the silver which goes to either India or China never returns to the Western hemisphere, while it is valued there even higher than the coinage par of Europe and America, and also while silver bullion is at a heavy discount in America and Europe. Therefore any bullion imported by India or China either remains there or is taken by other oriental nations, all being alike on a silver basis, constituting, as they do, with their 775,000,000 inhabitants, more than half the world's estimated population. The silver taken by them is as much lost to the other nations as if sunk into the sea or buried in the bowels of the earth. As stated in last week's article, China's silver imports, not included in the correct presented list, have aggregated $12,600,000 a year, and exports of silver $6,600,000. The latter she could only export to other nations in the Eastern hemisphere without sinking the premium it bears there, and consequently her whole import is included as an average annual addition of $12,600,000 a year to the Eastern dumping-grounds.

As stated in last week's article, India took in silver from 1850 to 1886 $1,399,000,000, and China for the like time took $443,600,000, making a total of $1,842,600,000 of the world's silver product or supply for the same length of time, while the mines of the world turned out only $2,305,000,000, leaving $463,000,000 for new bullion coinage outside of the Eastern hemisphere, whereas, as shown last week, the actual coinage in that period aggregated $2,551,487,000 in the Western hemisphere.

The coinage of the mints of the world has more than kept pace with the yield of the mines, as shown by the following latest-compiled table of comparisons for the five years ending with 1887, as furnished by the official report of the United States Mint Bureau:

	Coinage.	Production.
1883	$109,306,705	$116,938,000
1884	95,832,084	110,773,000
1885	126,764,574	122,799,000
1886	124,854,101	125,828,000
1887	160,994,877	135,449,000
Totals	$617,742,341	$611,787,000

Professor Soetbeer, the European oracle on money, estimates the annual consumption of gold in the arts by all nations at 90,000 kilograms, plus 20,000 kilograms of old material, and the consumption of silver in the arts at 515,000 kilograms, plus 137,000 kilograms of old material. This shows that the net silver bullion taken up by industrial consumption, 515,000 kilograms, amounts to $21,403,400 a year, and that of gold to $59,814,000. Accepting the above as correct, and we have a consumption in the industrial arts for the five years ending with 1887, of $107,017,000, which, added to the coinage, gives a total for the half decade of $724,759,341, against $611,787,000 the outturn of the mines. The result is, while leaving out of consideration the incidents of abrasion and loss, a net bullion supply of $611,787,000, and a net bullion consumption of $724,759,341, which gives an average annual consumption over production within that time of $22,594,468.

But this line of inquiry can be extended still further. In his official report just issued, Mint Director Kimball gives the silver coinage for 1887 by countries as follows:

British India	$44,142,013	Cochin-China	$3,126,410
United States	35,191,081	Turkey	2,216 668
Mexico	26,844,031	Siam	2,159,690
Spain	11,389,414	France	1,719,742
Japan	10,279,556	Russia	1,551,710
Italy	6,253,200	Peru	1,685,000
Austria-Hungary	5,556 395	Miscellaneous	4,723,435
Great Britain	4,142,136		
Total			$160,984,877

To offset the above there must have been considerable recoinage, for the products of the mines of the world in 1887, estimated even at a coinage value of 371 25 grains to the dollar, was only $135,449,410 in silver bullion (at the United States coining rate of silver the production of the mines was only $125,346,321), which gives a deficit of $25,535,467. The production includes all nations, but the coinage and absorption into circulation does not include 34 per cent of the earth's population, and that part using no other money but that of silver. It does not include the Chinese Empire and many islands in the Pacific and South sea, and only a corner of Africa.

In the light of the above, we ask, where, then, is the source of the supply from whence the mythical dump of silver is to come?

Any man gifted with common reasoning faculties and of honesty of motive must concede that with such environment of solid facts as we have presented, if the mints of the United States were made as free to the coinage of silver as they are to gold, the coinage parity would be instantly restored between silver bullion and the standard dollar, and thereby between the silver dollar and the gold dollar. He must concede that this would re-establish the position of silver bullion throughout the Western Hemisphere. He must concede that silver would be the safest commodity, except its ally—gold bullion—in the world to hold, because its value would be guaranteed by the richest Government of the world at a fixed price. He must concede that the nations of the world with their $3,500,000,000 of silver money and $3,125,000,000 of gold money, could only find in the example of the United States encouragement to aid in the appreciation of the half of their total circulating money, and that they would also reopen their mints. He must also concede that to sell any of the silver now in the form of coin would sacrifice 30 to 40 per cent of its money value, and to sell silver in the form of jewelry, plate, etc., would be to sacrifice from 100 to 1000 per cent of its art value.

Coal Supply.

California is, unfortunately, very scantily supplied with coal. The Mount Diablo mines are the only ones which ever produced any quantity, and that was inferior. Since the supply from these was lessened, we have received large quantities from Oregon and Washington, but most of that used here comes from Australia and England.

The Southern Pacific Co., in addition to its Carbon Hill mine, has lately opened a big mine on Vancouver island, 60 miles from the famous Wellington mine. A steamer with 4300 tons of this coal aboard is now on the way here, and two more steam colliers, each carrying 4000 tons, will follow her. These three vessels will hereafter be employed in bringing this coal to San Francisco, so the Southern Pacific Co. will no longer need to buy Australian or English coal.

In speaking of the importance of this change to a reporter, Colonel Crocker says: "My business at Vancouver this trip was almost exclusively looking after the development of our coal mines there, and I arranged to supply all of our engines and ships. Since the Mt. Diablo coal mine closed down nearly all of the coal used in this State has been imported from Australia and England. The sum that the Southern Pacific Company alone has sent out of the country for coal has been enormous. Hereafter that money will be kept in our own hands. There are several reasons for our making special efforts to get a permanent source of coal supply in our own hands and by water communication. The coal from the Ione mine is only used on the engine that runs to Galt and at some few pumping stations. It is not a strong coal, but will do for a few purposes. Coal from the great Rocky Mountain Coal and Iron Co.'s mine at Almy, in Wyoming Territory, is of good quality, but it does not pay to bring it here by rail."

Bullion by Express.

It was stated recently that Wells, Fargo & Co. had closed their office at Hildreth, Toll House and elsewhere in Fresno county, and would close their other offices in other mining camps, owing to frequent robberies. It seems, however, that the change referred to only particular localities and was not general. The superintendent says:

"We may have to close other offices in the future for the same reason that we closed these, but I don't know of any that are likely to be closed besides those at the present time. The losses at those places were in excess of the receipts, so we shut down. We could not secure the assistance of the people of those districts to convict the numerous stage robbers that were brought to justice, and as the business did not pay we stopped it. We will stop in other places if the same thing happens. It does not pay to carry treasure in districts where it is not considered a crime to rob an express company, but the papers are mistaken in saying that we intended to discontinue our mountain service altogether. On most of the routes the treasure business is quite satisfactory."

EUGENE N. ROBINSON, a very active mining man, lately engaged in operations at Seligman, Nev., died in New York last week.

GOOD sandstone has been found near the Santa Rita ranch, four miles from Lompoc.

THE CONKLING JIG FOR CONCENTRATING MAGNETITE.

Concentrating Magnetite.

There is now in use at the mines of the Chateaugay Ore and Iron Co., at Lyon Mountain, N. Y., an ore-concentrating machine or jig, for concentrating lean ores of iron.

The Conkling jig is an adaptation of old forms, but there are several points which deserve attention, particularly the method of central discharge, of freeing the bearings from grit, and the rotation of the sieve or screen. The ore-body at Lyon Mountain consists of a bed of rather compact, granular magnetite, occurring in a gneiss formation. The side walls of the ore-body are not sharply defined, the ore on either side becoming gradually poorer as the distance from the central point of the body increases. It is this lean ore, which, before the introduction of the jigs, was thrown away as waste, that is now concentrated. The material treated consequently consists of magnetite, intermixed with the component parts of gneiss, viz., quartz, felspar, hornblende, and mica. Grains of trap also form part of this material. These come from dykes of trap, which cross the ore-body at intervals.

The ore which is to be concentrated usually contains from 30 to 40 per cent of metallic iron. It is first crushed to the size of two inches, or less, by two large Blake crushers. The material from these crushers passes by a shute lined with screens, having holes ⅝ inches in diameter, to a second set of four crushers, set so as to close to one inch. The product from this set of crushers, together with that which passes through the screens in the shute, is then taken by an elevator to the top of the mill, and passed through a revolving screen, perforated with ½-inch holes. The ore which passes *through* the screen goes to the jig-hoppers; that which passes *over* goes to a third set of six crushers, set to ½-inch. These are of the Blake multiple-jaw pattern, having three jaws.

The product from these third crushers is again screened through a double revolving screen, having holes ½-inch in diameter, that which passes through goes to hoppers; what passes over goes to a fourth set of crushers. These are of the Blake multiple-jaw pattern, having six jaws, which are set so as to close to ¼-inch. The product from these last crushers is again screened, and the grains which are still too large pass again through the final crushers. All the material which passes through the ¼-inch holes goes to the jigs without further sizing. The ore is crushed dry, and goes to the jigs in that State.

The machine, as shown in the accompanying drawings, may be divided into four essential parts: 1—the frame; 2—the tub; 3—the jig; 4—the elevators. For the better understanding of the drawings, the following index of the names of the parts is appended, the numbers referring to corresponding numbers in Figs. 1 and 2: 1—bevel-wheel; 2—pinion; 3—upright shaft; 4—shoe; 5—link; 6—upper collar; 7—trunnion piece; 8—lower collar; 9—outside nut; 10—flange; 11—inside nut; 12—standard; 14—hoop; 16—screen-plates; 18—spider; 19—key; 20—cone; 21—water-sleeve; 22—water-box; 23—lower elevator-box; 24—lower elevator-shaft; 25—band arms; 26—cam-wheel; 27—36-inch pulley; 28—pinion shaft; 29—cone pulleys; 30—lever beam; 31—yokes; 32—lever-shaft; 33—driving-shaft; 34—top elevator-shaft; 35—24-inch pulley; 36—flange-pulleys; 37—cone-pulleys; 38—spring pole; 39—strap; 40—bumper; 41—3-inch water-pipe; 42—regulating valve; 43—outlet pipe to tail race; 44 tub; 45—splash rim.

The frame, which is shown in vertical section and elevation in Fig. 1 and in plan in Fig. 2, is made of squared spruce or hemlock timber, 6½x6½ inches, and braced by cross-bracing 3x4 inches, at the sides and ends. The frame is 4 feet 1 inch wide. There is an upper and a lower cross-piece at each pair of uprights, except at rear, where the cross-piece is placed 3 feet 8 inches from the rear end of the string-piece. To the lower side of the cross-piece is attached the bumper for the lever beam. The main driving-shaft is placed directly over the rear uprights, and 9 inches from the forward end of the string-pieces is placed the shaft for the elevator pulleys. Between the first and

second cross-pieces is a cross-beam which carries the journal for the upright or jig-shaft. The front edge of this timber is set even with the center-line of the jig. From this timber to the forward cross-piece extend two timbers, 4x6 inches, as shown in Fig. 2, which carry the boxes for the pinion shaft. To the second and rear cross-pieces are bolted pieces, 3x9 inches, and 2 feet high, which carry the spring-pole. On the front of the second pair of uprights, 1 foot 6½ inches (to center) below the string-piece, are the journals which carry the lever-shaft. The tub is of yellow pine, 4 feet 11 inches inside diameter. The staves are 4 feet 8 inches high, 5 inches wide and 2 inches thick. The staves are not divided. A door in the side gives access to the interior. The tub is set between the first and second pair of uprights, as shown in the drawing.

The jig consists essentially of a circular sleeve, suspended from one end of a lever, being moved up and down by a cam striking the opposite end of the lever. The concentrates pass through the sieve to the bottom of the tub; and the tails pass out by means of an annular opening around the jig-shaft. The general arrangement is shown in Fig. 2. Of the original cuts we omit Fig. 2; and Fig. 4 represents the "spider." In Fig. 5 is shown the cone and Fig. 6 is the water sleeve. This water sleeve slides up and down in the water box. All the water which is used in jigging passes through this box.

This description we take from a paper read before the American Institute of American Engineers, by F. S. Ruttmann. In next week's PRESS we shall continue the description.

SHOP NOTES.

Productive Efficiency of Shops.

It takes a constant spirit of progressiveness to keep a machine shop up to the times in the way of tools. And unless this is done the shop soon becomes "old." And the character of the tools in a shop is very likely to be reflected in the men. Good mechanics like to work with good tools, and are very likely to go where the can find them. A man who expects to spend the best part of his time in a shop will, if he is the right kind of a man, want his surroundings reasonably pleasant. Altogether, the old shop, with the old tools, is in a bad way. But it is not beyond redemption. New tools were never so cheap as at present, and they will go right along paying for themselves. Cranes and labor-saving appliances, with good tools, will make an old shop a new one. The trouble of getting rid of old tools seems to be that they stand something in the relation of old friends. Who ever heard of an old planer or lathe being put through the cupola, even when it would thus be doing the most good?

Again, time was when but little attention was paid to the construction of machine shops, except to get about so much ground covered, with the vague idea that the tools would find their places somehow. The outcome of this may be seen in the peculiar quality of unhandiness pertaining to many shops in this country. There is a vague understanding that unhandy shops are in some degree a hinderance to production; but just to what extent this is true is something that but little is known about, hence the following instance—which we have on undoubted authority—is of peculiar significance: A firm employing about 350 men, recently built new shops—machine shop, boiler shop and foundry—and moved the tools from the old shops into the new ones. No new tools were added, but there was a better arrangement of the tools, and overhead cranes were put in the new shops. The general arrangement was such as called for less handling of material, and also such that the necessary handling could be done more expeditiously. The result was an increase in productive efficiency of 25 per cent. This represents a large saving, and goes to show that the loss in shops, not properly constructed for the work to be done, is greater than it is generally believed to be.

The whole question of shop construction is one that could profitably be studied much more than it is. It is better not to build the new shop so soon, by a year or two, than to build it in a way it ought not to be built.

A great deal more attention is given now-a-days than formerly to what a well-known engineer calls "shopitecture," but the subject does not yet, in the majority of instances, receive the attention it deserves. There are many things to be considered, and some of them are likely to be slighted. It pays to put a good deal of thought into the construction of what is likely to vex or please the builder for the remainder of his life. If all shops were about equally unhandy, it would not matter much in the question of competition, but when one's neighber has a good deal the advantage in this respect, it matters very materially.—*American Machinist.*

A NEW LUBRICANT.—The *British Trade Journal* of London says that the Messrs. Gebruder Born (presumably of London) have hit upon a new use for mustard oil, which they have manufactured for a number of years for culinary purposes. Experiencing difficulty in reducing the heat of a bearing which other lubricants were powerless to affect, the firm's engineer applied a quantity of their mustard oil, and with the most satisfactory results. It was then used upon other bearings by way of experiment, and a test having been made by one of Messrs. W. H. Bailey & Co.'s machines, it was found that the percentage of fat in mustard oil, compared with olive oil, is 263 to 168, and as compared with naphtha as 263 to 125. It is found that the new lubricant retains its consistency even when the temperature is seven or eight degrees Reamur below zero. It can also be kept for years without becoming rancid or losing its lubricating quality, even should it come into contact with the atmosphere. Hence it differs very much from all other vegetable oils and lubricants, which generate destructive acids if kept for a time or exposed to the air.

A Valuable Calculating Rule.

The *Engineer* (London) describes a new calculating rule made by J. Davis & Sons, London, which seems to be a considerable improvement upon the ordinary slide rule. It is of the Grant type, ten seconds long, of wood into which are fitted strips of hard white culluloid, on which the graduations are placed, the lines being black. The strips are said to be entirely without relative change in varying temperature, and a degree of accuracy is obtained superior to what has heretofore been accomplished. The calculations that may be performed by the aid of this rule are endless in number. In addition to the ordinary processes of multiplication, division, evolution and involution, it may be used for a variety of technical calculations in which its use effects an enormous saving of time. Thus the engineer may compute the strength of beams, moments of inertia, horse-power of engines, hydraulic formula, areas of circles and ellipses, cubic contents, weights, conversion of British into metric or other systems of measurement, without putting down a single intermediate quantity. The electrical engineer may solve all problems involving the application of Ohm's law of the relation between current, electromotive force and resistance. The surveyor may plot surveys by rectangular co-ordinates and set out curves. The chemist is enabled by its aid to calculate percentage compositions rapidly. The mode of using the slide rule may be learned by any one with no mathematical training in a very short time, and rapidity and accuracy are merely matters of practice. As the results obtained are quite accurate enough for practical work, the slide rule, now that it can be obtained at a moderate price, cannot fail to come into more extended use among engineers, electricians, chemists, and all to whom saving of time and of mental effort is of importance. No one who has once learned the use of this kind of rule will ever go through the laborious work of any calculations by the ordinary methode.

LUBRICATING OILS.—It is a mystery that men who are called upon to use lubricating oils—that is, to do the work of using them—can never understand why, when an oil has been found just right for the purpose for which it is intended, a change is made by those who control the purchasing power. Valuable machinery is often sadly damaged by such changes. The highest priced oil is not always the best, but the best of common oils is generally the cheapest. When a large quantity of machinery is operated, the quality of the oil used often has an important bearing on the amount of coal burned, and sometimes the rapid destruction of delicate machinery more than overbalances the cost of both coal and oil. The reason, sometimes, why a change of oil is made when the quality is in every way satisfactory, is that the new "oil man" has an insinuating way with him that captivates the purchaser, and sometimes, alas! the purchasing agent is captured by other means. There are reputable dealers in oils who, a quality having by experiment been found that is best for the purpose, undertake to furnish it of a standard grade as long as desired. Lubricating oils are, at the present day, very commonly a compound of animal and mineral oils, and vary quite widely as compounded for different purposes. Many dealers have been to considerable trouble and expense in getting at the best mixtures, and can frequently give good advice when the purpose for which the oil is to be used is known to them.—*Ex.*

WASH-ROOMS VS. PAILS.—In building a new shop, the question, "Where shall the men wash?" is pretty sure to come up, especially if the shop is to be in a large city, where space is valuable. We all know what the old way is—pails under the benches, under the lathes and under everybody's feet. Some shops, seeing the evils of this old way, set aside one room for washing purposes, and allow no pails whatever in the shop. Everything necessary is provided in the room, the principal fixtures usually consisting of long sinks filled with water, which are used by the men in common. The principal objection to this scheme from the employer's standpoint, is, that it occupies considerable room which is often valuable, and might be advantageously used for other purposes, and it is also likely that some of the workmen might have preferences for places of their own, rather than use a sink in common with all. The problem may be a somewhat difficult one to solve in many cases; but it should be so solved, in every instance, that convenient and cleanly conveniences of this kind should be furnished to all the workmen in every shop.

MECHANICAL TRAINING.—The scheme for the training of mechanics approved by the Master Builders' Exchange of Philadelphia, provides for the education of boys in a mechanical trade school until they have obtained a certificate of proficiency and a service for a term of practice with an employer, this term to be at least one year less than the usual term of apprenticeship by virtue of the holding of a certificate of proficiency granted by a mechanical trade school. The completion of the education of the mechanic is to be acknowledged on the part of the employer by the granting of a certificate from the association of builders, setting forth that the holder has passed through the prescribed course at the trade school and the term of practice with an employer, and is entitled to be received by all builders as a journeyman. With similar schools established in New York, Philadelphia and Boston, this system will, it is believed, in time afford a substitute in part for the old form of apprenticeship, and be of advantage to both the young men and their employers.—*Ex.*

Ready-Made Houses.

We have been requested to give the address of a firm in this city, or elsewhere in the State, that sells cottages in sections. Our correspondent thinks that such buildings were made some years ago in the redwoods and that there was an agency here for their sale.

We do not know of any concern that is furnishing them, but would be glad of information on the subject. We think it would be well if more attention were paid to the manufacture of portable houses.

THE Bakersfield *Echo* says: The green sandstone found near the Southern Pacific railroad in this county is the finest in the State. The esthetic city of Pasadena thought it good enough for its library building and used it for that purpose. A small capital could find lucrative employment in working quarries of this stone.

JULES BAUMANN has been appointed agent and correspondent for Dewey & Co.'s publications of San Francisco, including the MINING AND SCIENTIFIC PRESS, an able and ardent champion of Arizona's mining interests.—*Prescott Journal-Miner.*

RUBBER FACTORY.

Monarch Belting.

The Plies of this Belt are UNITED by COTTON RIVETS Which hold them firmly together.

Each Rivet is Independent And Follows the Stretch.

THERE ARE NO STITCHES TO BREAK, and The Belt has a Smooth Surface.

ANNUAL MEETING.

Annual meeting of the Mutual Enterprise Co., for the election of a Board of Directors to serve the ensuing year, will be held at Room 9, No. 327 Pine street, on Tuesday, July 9, at 1 P. M. O. H. BOGART, Sec.

DIVIDEND NOTICE.

THE GERMAN SAVINGS & LOAN SOCIETY

526 California Street.

For the half year ending June 30, 1889, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on Term Deposits, and four and one-quarter (4¼) per cent per annum on Ordinary Deposits, payable on and after Monday, July 1, 1889.

GEO. TOURNY, Secretary.

SAN FRANCISCO SAVINGS UNION,

532 California St., Cor. Webb.

Branch, 1700 Market St., Cor. Polk.

For the half year ending with the 30 h of June, 1889, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on term deposits, and four and one-quarter (4¼) per cent per annum on ordinary deposits, free of taxes, payable on and after Monday, July 1, 1889. LOVELL WHITE, Cashier.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft; No. 2, 9½ ft; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. Q. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

YOUNG MINING ENGINEER, SPEAKING GERMAN, English and Spanish, wants position. Is acquainted with gold works in gold and silver mines, mills, concentrators and chlorination works; good assayer and surveyor. Address MINING ENGINEER, 2211 Van Ness Ave., San Francisco.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F

FREEMAN'S

Dry Process

GOLD SEPARATOR.

They are good machines. If the gold is in the dirt they will save it. They will save finer gold than water will.

T. J. SCOTT,

Osceola, Nevada.

Smith & Drew took out Tuesday, in their dry wash diggings, in addition to 5 ozs. of fine gold, a nugget weighing 22 ozs. The machine used was Freeman's Dry Process Separator.—*Utah Daily Union, May 10, 1889.*

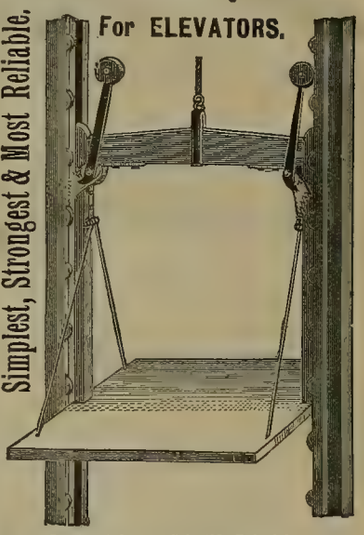
NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

THE VICTOR CONCENTRATOR
Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:
1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.



Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address
S. W. SHAW, or N. W. SPAULDING,

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JUNE 25, 1889.

405,951.—STORE SERVICE APPARATUS—Percy L. Davis, S. F.

405,957.—FISHING NET—H. E. Freyschlag, San Jose, Cal.

405,772.—GATE—G. Guibbini, Point Reyes, Cal.

405,778.—FRAME FOR ILLUMINATING TILES—P. H. Jackson, S. F.

405,890.—FENCE MACHINE—J. M. Keith, Albany, Ogn.

405,715.—MUSIC STAND AND PORTFOLIO—Viola Moore, S. F.

405,699.—EXTENSION LADDER—W. S. Odle, Los Angeles, Cal.

405,798.—BRAKE ROD ATTACHMENT—N. C. Price, Pocatello, I. T.

405,800.—FINISHING ARTIFICIAL STONE SURFACES—E. L. Ransome, S. F.

405,744.—WIRE ROPE MACHINE—Henry Root, S. F.

406,009.—FIRE GRATE—H. Sutcliffe, Oakland, Cal.

The following brief list by telegraph, for June 25th, will appear more complete on receipt of mail advices:

California—Henry T. Welch, San Jose, inhaler; James C. Weir, San Francisco, ball castor; the same, metal corner-piece for boxes; John H. Ware, Eureka, mop grip; William Lamb, Downey, cooking stove; Elijah S. Gilmore, assignor of two-thirds to N. W. Spaulding, San Francisco, band sawing machine; the same, saw-regulating attachment gear for band sawing machines; Miles B. Dodge, assignor to Parke & Lacey, San Francisco, ore concentrator; Jeremiah E. Day, assignor of one-half to J. Pracy, San Francisco, well-boring apparatus; Harry B. Belden and M. A. Taylor, Oakland, casket pedestals; Adolph V. Anderson, San Francisco, pipe cutter.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GATE.—Gottardo Guibbini, Point Reyes, Marin Co. No. 405,772. Dated June 25, 1889. This invention relates to that class of gates which are opened and closed by the passage of the vehicle over loops which project above the surface of the roadway in the vicinity of the gate. It consists in certain constructions and combinations of devices to make a simple practical gate.

FRAME FOR ILLUMINATING TILE.—P. H. Jackson, S. F. No. 405,778. Dated June 25 1889. It is usual to make illuminating tiles with heavy cast-iron sash frames glazed with thick glass, and, where a number are together, to prevent leak at the joints between the tiles, and to support their sides, bearers are used, secured to the sides of the tile-frames, the seam between the tiles being filled with cementing material. Wrought-iron frames are also used, made of several pieces riveted together and the spaces filled with cementing material; but these are quite expensive of construction, which is also the case with cast-iron frames on account of the cost of patterns and the continual alteration of the same to suit different lengths and the various outlines of buildings where they are to be used, and to be of equal strength with wrought-iron frames, they must be made much heavier and be supported by bearers, which causes an additional expense. Mr. Jackson's patent covers a peculiar construction and arrangement of sash-bars wherein the glass is to be held between said bars.

STORE-SERVICE APPARATUS.—Percy L. Davis, S. F. No. 405,951. Dated June 25, 1889. This invention relates to that class of store-service apparatus in which a number of track-lines proceed from the various sales counters to the wrapping or packing desk or platform, said track-lines being adapted to be moved to an inclination by the salesman at the counter, whereby the parcel carriage or basket is adapted to roll by gravity upon the track-lines from the sales counter to the wrapping platform and back again, according to the inclination of the lines. The invention consists in a novel mechanism for automatically holding the track-lines at the proper inclination to enable the parcel carriage or basket to travel from the sales counter to the wrapping platform and relieving said track-lines so that they may return to the opposite inclination to enable the parcel carriage to return to the sales counter. The object is to relieve the salesman from the necessity of holding the track-line in its elevated position during the time while the parcel carriage is traveling to the wrapping counter. By this invention the track-line is automatically caught and held in an elevated position, so that the salesman, after raising it, need pay no further immediate attention to it, and as soon as the carriage is ready to be returned, the clerk at the wrapping counter releases the track-line and allows it to drop again to its downward inclination enabling the carriage or basket to return.

THE new saw-mill at East Fork, Trinity county, will be very useful in that camp.

Coast Industrial Notes.

THE Pioneer tannery at Benicia was burned on June 25th. It was one of the largest and best equipped tanneries in the State.

AT the new West Coast Lumber Co., San Diego, they are now provided with arrangements for furnishing kiln-dried lumber.

THE Fresno *Republican* says Fresno county has enough iron ore in sight to duplicate all the navies in the world. If this is so the mountain railroad should be built as soon as possible, for it certainly would be better to use California iron than ship it 2000 miles.

THE National City *Record* says that another great water scheme is on foot. A big dam is to be built across San Felipe canyon to store water for irrigating a portion of the Colorado desert. Thousands of acres of otherwise worthless land may be made valuable.

THE Livermore *Herald* says: The first chrome of the present season came into town last Tuesday, and two teams are now engaged in hauling. This number will be increased, as there is already a hundred tons of ore on the dump, awaiting shipment. The ore will go around Cape Horn.

A NEW sawmill is being built at Caspar, Mendocino Co., to replace the one recently burned. They have been lumbering at this place for very many years. The railroad built a few years since, however, opened up an extensive belt of timber which the new mill will work up.

AS a reason for going out of business, one of the proprietors of the Pioneer Woolen Mills of this city, says: "The simple truth is that the business don't pay and it has not paid for five years. We have been engaged exclusively in the manufacture of coarse goods, and we are too far from the center of population to hope to succeed, so we will settle our debts and go out of business."

THE Pearl Shell Co. has about 300 men engaged in diving for pearls in the pearl zones of the Gulf of California. The Mexican Government allows the company to work in each zone only once in two years. The two-year-old oyster has the best and the greatest number of pearls. A German merchant on the gulf coast bought $50,000 worth of the iridescent beauties last year for the European market.

AT Hall Bros.' shipyard, at Port Blakeley, the four-masted schooner Golden Horn is being built and is almost ready to be launched. The schooner's dimensions are: Length, 185 feet; beam, 58½; depth of hold, 14; gross tonnage, 669; net, 664 tons. This is the sixtieth vessel built by Hall Bros. since their location on the sound. When finished, the Golden Horn will carry from 90,000 to 1,000,000 feet of lumber.

THE Willows (Colusa Co.) *Gazette* says: "Alex. Chapman is in from the Sanhedrian mill and reports that all is running along smoothly. At the present time and until the machinery is in place, all hands have been laid off. He informs us that the first lumber will be cut in about two weeks. When completed the mill will be the finest in the country. Besides sawing lumber into lengths, there will be a complete box factory, shingle machine, etc. It is what has been needed in this country for a long time."

WORK is going on to open the oil springs at Montecito, Santa Barbara county. These springs are not a recent find, as they have been known by a few for ten years. The owners of the land, Col. Reed, John Laughlin and Charles and Douglass Swift, have at different times endeavored to increase the flow of oil by tunneling, but they were unable to do more than to penetrate the rock a few feet. In one of their attempted tunnels is now accumulated twenty or thirty barrels of a thick tar like oil, while the thin oil finds an escape through the mass of broken rock that partially closes the mouth of the tunnel. The Occidental Mining and Petroleum Company, of Santa Barbara, has leased the property for a term of years, and intends to proceed at once to the development of the springs.

ABOUT a month ago the employes of the Napa woolen mills petitioned the manager to reduce the hours of work from 11 to 10 per day. After consideration by the directors and manager of the mill, it was determined to grant the request, but as the profits of the mill did not warrant paying the present wages for the reduced hours of work, it was decided to reduce wages in proportion to the reduction of time. Notice was given the help that on July 1st the mill would shut down for one week, after which only 60 hours of work per week would be required, and each employe was told what wages would be paid him on the new time schedule. According to the notice given, the mill was shut down this week. The manager says they will be ready to start again Monday, July 8th, and that he expects most of the help will return to work, though a few of the hands say they will not accept the reduced schedule. The mill has been running about four years, and has not yet paid its stockholders one dollar in dividends.

State Mining Bureau.

The following are among the recent contributions to the museum of the State Mining Bureau:

Silver ore from Best Chance mine, Minarets Buttes, Fresno county, Cal. This is the new camp known as the Minarets; the ore is represented to be in immense quantities, but is very base, containing, besides the silver, galena, copper, antimony, zinc blende, iron, arsenical pyrite, etc. Fred Barcroft.

Marble; polished slab from Fair Play, El Dorado county, Cal., which has been exposed to the weather 25 years and still retains its polish. There is said to be a large body of similar quality in the vicinity. This is from Jas. A. Scott.

Menaccanite, a fine specimen from Chiquemula district, Guatemala. M. San Pedro.

Epidote; large and handsome specimen from Eber Flat, Tulare county, Cal. J. W. Donelly.

Tin ore, a fine specimen, Wheal Vore, Cornwall, England. J. F. Cox.

Barite, Callahan's Ranch, Siskiyou county, Cal.; occurs associated with argentiferous galena. J. F. O'Gorman.

Halotrichite, in beautiful silky fibers, old Eureka tunnel, Livermore, Alameda county, Cal. D. Gutmann.

Alunogen, San Diego county, Cal.; could be used for making alum. A. C. Taylor.

Gold quartz, Ribbon Rock mine, near Columbia, Tuolumne county, Cal. W. O. Bowers. Assay, $600 to the ton.

Gold quartz, showing free gold; Pet vein, Crescent mine, Crescent Mills, Plumas county, Cal. Capt. J. M. McDonald.

Gold quartz; Gold Run mine, Ætna, Siskiyou county, Cal. From the company.

Gold in calcite; Alvord mine, Camp Cady, San Bernardino county, Cal. W. L. Newman.

Seventeen specimens rare minerals from Eastern States and Europe.

Gold quartz, rich in free gold; Gold Canyon, Sierra county, Cal. R. D. McKillican.

Series of 20 specimens illustrating the smelting process of reduction of base ores at the Hanauer works, Salt Lake City, Utah. From the company.

Twenty-two ethnographical specimens, Indian stone implements, crude pottery, etc., Tulare county, Cal. J. Z Davis.

Series of specimens of gold quartz with accompanying wallrocks from mines in El Dorado and Nevada counties, Cal.

Twelve specimens, chiefly silver ores from the Bocaneme mines, U. S. of Colombia, South America. D. T. Hughes.

Very fine specimen of pearl spar (dolomite) on calcite, Durham, England. J. W. Foss.

A number of very rich specimens of tin ore and accompanying minerals from the Harney Peak Tin M. Co., Dakota. Per Richard D. Atkins.

Auriferous conglomerate, locally called "banket," Witwatersrand, Transvaal, South Africa. R. D. Atkins.

Gold quartz; Sheba mine, De Kaap district, Transvaal, South Africa. Average over ten ounces to the ton. R. D. Atkins.

Lepidolite; San Diego, Cal. Exists in large quantity. R. Garvey.

Six specimens rich silver ore from New Mexico. C. H. Laidlaw.

THE NEW COMET.—Prof. Holden writes from the Lick Observatory as follows: Mr. Leuschner, a student in the observatory, has computed the orbit of the comet discovered here on June 23d by Mr. Barnard. He finds that this faint comet was already past its perihelion when it was discovered. It was nearest to the sun on June 20th. If the brightness of the comet on June 23d be taken as 100, its brightness on June 29th was 92, and on July 12th it will be only 76, so that this comet, like so many others, will never become visible to the naked eye. On June 23d the comet was 102,000,000 miles from the sun (the earth's distance is about 93,000,000), and at the same distance from the earth. On July 12th its distance from the sun will have increased to 107,000,000 miles, and from the earth to 114,000,000. Its positions are: July 7th, R. A. 2 hours 24 minutes north; declination, 45° 11'; July 11th, R. A. 2 hours 43 minutes north; declination, 46° 27'. The comet is too faint to allow the use of the spectroscope to analyze its light, so that almost its whole history is given above.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
W. E. BECK—San Francisco.
WM. H. COOK—Fresno and Santa Cruz Cos.
W. W. THROBALDS—Central California.
H. G. PARSONS—Central California.
GEO WILSON—Sacramento Co.
FRANK S. CHAPIN—Colusa and Butte Cos.
E. H. SCHAEFFLE—Calaveras and Tuolumne Cos.
DR. W. F. DRAKE—Sonora, Cal.
CHAS. DUGAN—Stanislaus Co.
A. F. JEWETT—Tulare Co.
E. W. HAMLIN—Alameda Co.
JULES BAUMANN—Arizona.
CHAS. F. BLACKBURN—Idaho.
R. G. HUSTON—Montana.

THE Bridge and Building Department of the Central Pacific has been awarded the woodwork for the Stanford University. This work is all in hard wood, and will give employment to 350 mechanics of Oakland for the next three and a half years.

Mining Share Market.

The market for the Comstocks, the past week, was quite active with Ophir and Mexican the leaders. This first-named stock advanced from $4, its low figure, to $6, when it fell back to $5. At the close it has a strong advancing tendency. The rest of the Comstocks moved slightly in sympathy. The general feeling on the street is still of a bearish character, and when prices moved up there were free realizing sales, under the belief that before the close of next week a low range of prices will obtain. Although the general feeling is bearish, yet there are many of the heretofore more pronounced bears, who are hedging and gradually changing to the bull side. This changing of heart is said to be due to heavy sales of stock by the outside public, and its absorption by the pool, and also to the important character of the work now going on towards the west in the mines of the Gould Hill, Middle and North End groups. The best informed say they can not tell how soon any important developments will be made, yet they are under the impression that it will be several weeks, and in the meantime stocks may have quite a decided move up, but what on they profess ignorance. While the work in the mines deserve careful study yet to outsiders it is dangerous to buy and sell stock on, for the mines are often, but not always, one thing and the stocks under manipulation quite another. In outside stocks trading the past week was quiet with the market heavy, for prices generally crawfished while the Comstocks advanced, and with the latter breaking the former, outside of the Tuscaroras, set back still more. There appears to be more quiet hopeful talk regarding outside stocks, but about all dealers think they must go lower before they can buy for much of a move. Although we are not advised by reliable parties from the mines, yet there are usually well informed parties in this city who are more hopeful of the future of the work going on in some of the Quijotoas, Tuscaroras and Bodies. Their information from the mines, they claim, points to better results in the near future; yet until we are further advised we only give the above as reports from heretofore well informed parties.

The adjournment of the two stock boards from to-day at noon until Monday at 11 o'clock A. M., interfered to some extent with the volume of business transacted.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

BUCKEYE M. CO., June 29. Location, Lyon Co., Nev. Capital stock, $2,000,000. Directors—D. W. Balch, F. D. Culver, J. H. Burlong, J. W. Classen and F. M. Johnson.

RAPID SAFETY FILTER CO., June 29. Capital stock, $500,000. Directors—C. L. Ackerman, T. J. Craig, Moses Deutch, H. S. Hunt and W. D. Mansfield.

GOLDEN GATE SAFETY FAUCET CO., July 1. Object, to supply such articles and fittings as are used in handling liquid in barrels and casks. Capital stock, $100,000. Directors, Mark Anthony, L. B. Booth, W. C. Savage, W. J. Bowman and Augustus Quade.

MUTUAL MANUFACTURING CO., July 1. Capital stock, $100,000. Directors—A. Burdel, C. W. Wright, L. Maas, W. F. Mau and E. H. Morgan.

PACIFIC TELEPHONE CO., July 1. Object, to deal in telephones and telegraph appliances. Capital stock, $5,000,000. Directors—Lloyd Tevis, W. H. Forbes, Geo. S. Ladd, E. S. Pillsbury, Samuel Hubbard, W. F. Goad and W. C. Gibbs.

CALIFORNIA ENGINEERING CO., July 2. Capital stock, $200,000. Directors—J. H. Headley, A. H. Hoadley, G. D. Deal, J. H. Peck and S. P. Jewett.

OCCIDENTAL LAND AND IMPROVEMENT CO., July 2. Capital stock, $50,000. Directors—J. P. Martin, B. W. Campion, James Newlands, A. D. Sharon and C. L. McCoy.

NEW HOME REAL ESTATE AND BUILDING ASS'N, July 2. Capital stock, $600,000. Directors—J. H. Dondlat, C. H. Rogers, J. J. Hogan, Eugene Fisk and J. Miron.

A LARGE deposit of asbestos has been found near the line of the Cuyamaca railroad in San Diego county.

DELINQUENT SALE NOTICE

Gray Eagle Mining Company—Location of principal place of business, San Francisco, California. Location of works, Placer county, Cal.

NOTICE.—There are delinquent upon the following described Stock, on account of Assessment (No. 13), levied on the 15th day of May, 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
Bogart, O H, Trustee	447	5,000	$250 00
" "	467	100	5 00
Chase, Q A	419	3,814	190 70
Carnes, W A	252	416	20 80

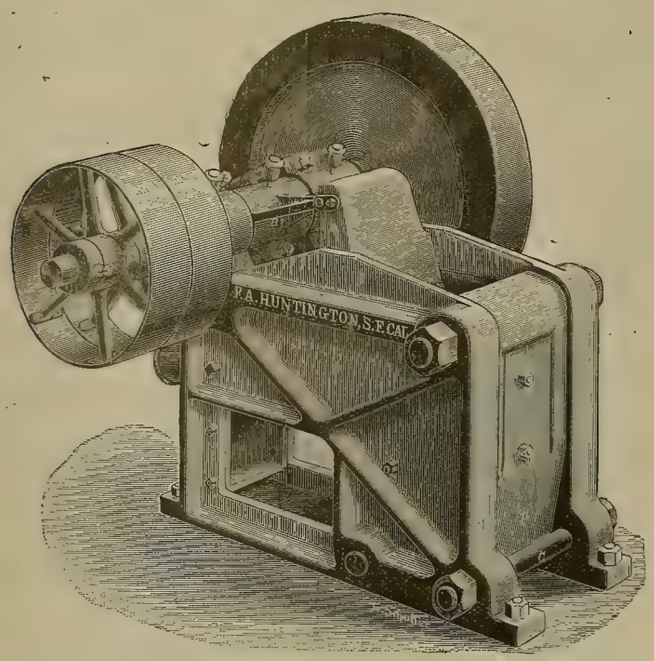
Winter, T P, Trustee	396	500	25 00
" "	397	500	25 00

And in accordance with law, and an order of the Board of Directors, made on the 25th day of June, 1889, so many shares of each parcel of such Stock as may be necessary will be sold at public auction, at the office of the Company, 327 Pine street, room 9, San Francisco, California, on Tuesday, the 23d day of July, 1889, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale. O. H. BOGART, Secretary.

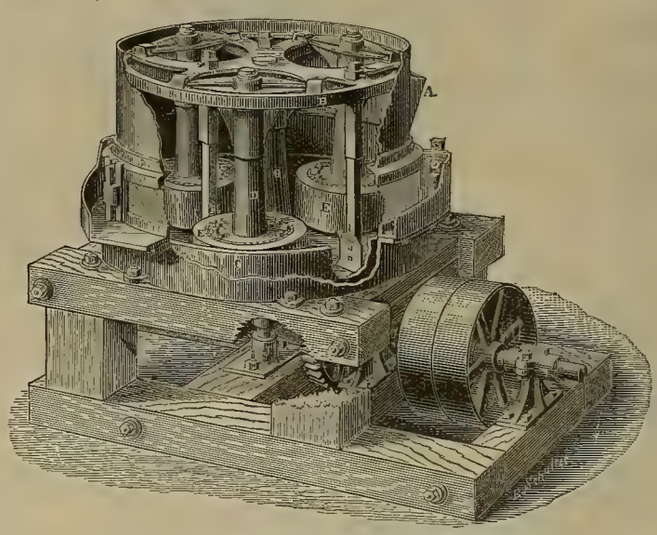


Office, 327 Pine street, room 9, San Francisco, Cal.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

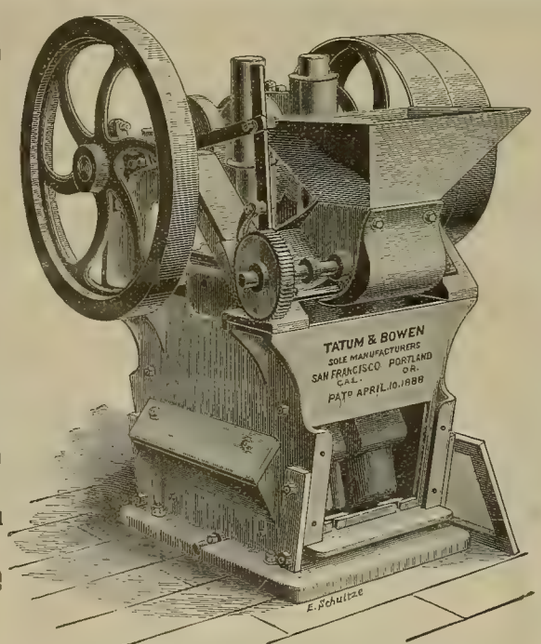
The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.



The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

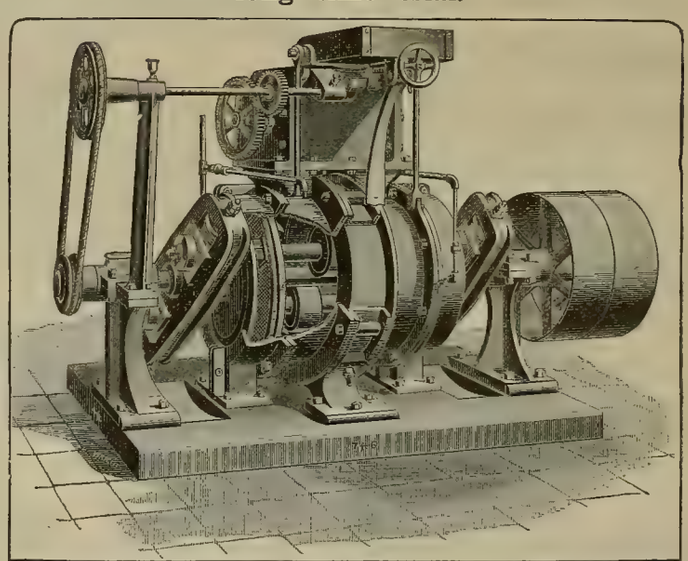
The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:



TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,
AND PORTLAND, OREGON.

MANUFACTURERS OF MINING AND SAW MILL MACHINERY.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL....

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

Air Compressors, Rock Drills, Etc.

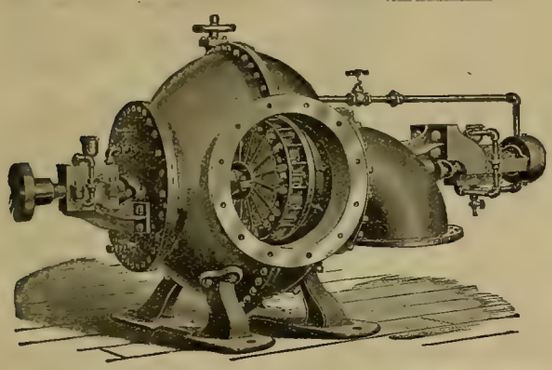
GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

IMPROVED WATER JACKET

Blast Furnaces for Galena & Copper Ores,



SLAG CARS AND POTS,

Roots & Baker Pressure Blowers,

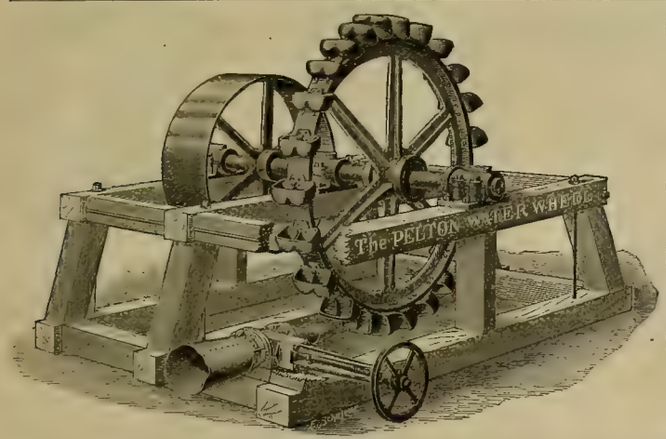
SUSPENDED TRAMWAYS.

General Offices and Works: FULTON AND UNION STS., CHICAGO, ILL.

BRANCH OFFICES: NEW YORK, Room 43, No. 2 Wall St. DENVER, COLO., 1316 Eighteenth St. SALT LAKE CITY, UTAH, 7 W. Second South St. LONDON, ENG., 23 Bucklersbury, E. C. CHIHUAHUA CITY, MEXICO, No. 11 Calle de Juarez. LIMA, PERU, South America. JOHANNESBURG, TRANSVAAL, South Africa.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.



Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.
WORKING TESTS OF ORES BY ALL PROCESSES.
SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

SELBY SMELTING and LEAD CO.,

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

....MANUFACTURERS OF....

BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,

Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

318 Pine St. (Basement,)
Corner of Leidesdorff Street, - - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.
Assaying and Analysis of Ores, Minerals and Waters.
Mines Examined and Reported on.
Practical Instruction given in Treating Ores by improved processes.

G. KUSTEL & CO.,
Mining Engineers and Metallurgists.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 3, 1889.

General trade still wears the mid-summer holiday character, and no material increase in the volume of goods to go out on orders is looked for until after the present month is passed. All advices concur in stating that interior merchants are carrying smaller lines of goods than even at this time in 1888, while a decided increase in the demand is looked for.

The local money market has an easy tone. Heavy disbursements are being made to meet semi-annual interests and the regular dividends. It is generally conceded that the moneys disbursed in this way soon find their way back into the general reservoirs. Remittances from the interior are very light. There is an increasing call for money for crop purposes, with several large sums reported to be engaged for use as required. It is generally conceded that in various mining districts in this State and territory contributory to us that there will be less activity than there was even in 1888, owing to the light supply of water; but in many of the districts where there are mills run by steam there will be more doing.

In the speculation markets, trading was to some extent interfered with by many active operators being out of the city. Those left appeared to have been inspired by a desire not only to do more business but advance prices. Mining-stock and cereal futures have been quite active wite attractive fluctuations.

The last steamer leaving for China took out for Hongkong the following treasure: Mexican dollars, $351,605; gold coin, $9922; silver bullion, $170,600; gold dust, $935. Total, $533,062.

The bank clearances for June compare as follows: In 1888, $66,093,189; in 1889, $67,897,824. Increase this year, $1,804,635.

The internal revenue collections from January 1, 1889, to July aggregate $926,598, against $1,046,594 for the like time in 1888.

For the first six months of the year the custom duties collected compare as follows: in 1889, $4,508,-301; 1888, $4,805,627; 1887, $3,470,418.

The coinage of the United States mint in this city for the fiscal year ending with June 30, 1889, was as follows:

Descriptions—	Amount.
Double Eagles	$17,447,000
Eagles	5,907,000
Half Eagles	4,500
Standard Dollars	108,000
Quarter Dollars	112,000
Dimes	155,455
Total	$23,733,955

The total for 1887-88 was $25,701,284, against $23,215,812 in 1886-87.

The shipments of gold to Europe from New York are attracting attention. The New York *Journal of Commerce* says that since April they aggregate about $30,000,000. One of the largest shippers of gold said: "Our gold is going to Paris and it is a legitimate exchange transaction. The Bank of France is calling for gold. It has not been receiving gold before for a long time. The Exposition has something to do with it. The balance of trade is in favor of France and against America, and Americans are spending immense sums in Paris this year." The regular weekly statements of the New York banks just to hand do not show that the drain has been felt in the least possible degree, so wonderful is our mineral resources.

The receipts of treasure by sea the past week were light, being $3785 in coin, with a silver bullion shipment from Mexico, value not obtainable.

SILVER — The London market held steady throughout the week, but the New York market fluctuated at lower prices. In our market prices, so far as obtainable, range from 92½ to 92⅝c according to the wants of the buyer. The last steamer for China took out very little silver bullion, and yet the supply on the market is very light. The day the steamer left 92.55 cents was bid for a parcel. If bought it would have to be held until the next steamer leaves. The production of the mines on this coast is not much more than 75 per cent what they were last year at this time.

London cables came through to-day at 42 1-16d. In our market we are not able to get any sales, quotable at 92½@92¾c.

MEXICAN DOLLARS—The market has held very strong, with 75c paid for new. The last steamer for China took out larger shipments than at any one time this year.

QUICKSILVER—Receipts the past week aggregate 91 flasks, and the shipments by sea 15 flasks to Auckland. For the month of June the receipts were 1573 flasks, and exports by sea, 431. For the first six months of the year the receipts and exports by sea compare as follows:

	Receipts.	Exports.
1889	8,205	5,793
1888	14,076	7,226
1887	11,583	5,197

The local market holds fairly strong at quotations, with a good demand for the season.

BORAX—Receipts the past week aggregate 56 ctls. The receipts for June aggregate 159,900 lbs., exports 747,304. The receipts and exports for the first six months of the year aggregate as follows:

	Receipts.	Exports.
1889	2,405,600	*3,389,132
1888	4,399,800	2,703 779
1887	3,308,800	4,817,132

Exports by rail not received.

The market holds very strong, with a good consumptive call from the East.

LIMES—Receipts the past week aggregate 3497 barrels. The market continues fairly active, with a good consumptive or shipping demand from Hawaii report. Prices are steady,

TIN—No imports the past week. There was shipped by sea to Victoria, B. C., 54,000 lbs. of plate. The market for both pig and plate is easier, for both spot and shipment. The consumption on this coast by fruit canners, it is claimed, will not equal that of 1888, while the consumption by salmon packers and others is always an uncertain element. The market abroad is reported to favor buyers at a slightly lower range in values.

LEAD—With us the market is reported strong with an advancing tendency. The feeling appears to be that the decision of the Treasury will be against Mexican ores, even if it is not the Mexican Government will probably take steps to put an export duty on the ore so as to keep the working of it in their country. It looks as if the upward movement at the East in lead is brought about by the Lead Trust Company so as to float, more successfully, their lead trust certificates at good profits, the same as was done by the Rothschilds in the late copper deal in Europe of all securities based on the price of copper.

COPPER—The statistical position of copper abroad appears to be steadily shaping in the interest of holders. The stocks, although reduced, are yet several times higher than they were from two to three years ago. At the lower prices consumers are using more.

IRON—The market continues unchanged. Consumers are gradually using up their surplus. The large stock here (about 2000 tons) held by first hands, is an increase to the market, and until it is worked to lower figures, no improvement in values is looked for.

COKE—The spot market is well cleaned up. The high prices is quite an inducement to foundrymen to sell part of their spot surplus. For shipment, values are unchanged.

COAL—Imports the past week were as follows: From Australia, 11,111 tons; Departure bay, 5100; Nanaimo, 1224; Irondale, 320. Total, 17,755 tons. The market shows a strong tone for both foreign and domestic. Importers of Australian for early loading are quite bullish. Several cargoes have been placed the past week for this month's shipment at from $6.75 to a fraction advance. For September-October loading, the market is quotable at about $6.50. Importers claim that with an advance in wheat charters, several American vessels engaged in the coast coal trade will withdraw and accept wheat charters, which, if the case, will cause higher freights for coast coal. Large consumers of coal are not disposed to anticipate their forward wants to any great extent after July-August loading, believing that later loading will come on an unfavorable market, and that holders will be forced to sell for less money. Wheat charters are advancing, which will attract more coal-laden vessels.

Eastern Metal Markets.

By Telegraph.

NEW YORK, July 2, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42	91¾	$12 00	$4 05	$19 90
Friday	42	91¾	12 00	4 05	19 85
Saturday	42	91¾	12 00	4 05	19 90
Monday	42	91¾	12 00	4 05	19 85
Tuesday	42	91¾	11 75	4 05	19 65
Wednesday	—	—	—	—	—

NEW YORK, July 2.—The copper market is in better form, including an enlarged home consumption. Baltimore copper, 10½c, extreme; Lake, nominally, 12c. Pig lead maintains its strength at $4.02½@$4.05 bid for August, the latter being obtained for 50 tons; $4.10 for September and $4.12½ for November and December; 200 tons spot, mostly at $4@4.02½. Refined borax is scarce and higher. Parcels on the way have been absorbed. Quicksilver, 65@66c, supported by London rates.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, 29, $66,414; Justice, 29, $4297; Commonwealth, 29, $16,000; Hanauer, 26, $5100; 28, $2800; 29, $2200; 30, $2900; Alice, 28, $24,320.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE California Cotton Mills are outputting 6000 pounds of twine daily. New machinery will be obtained, and the yield then will be four tons of twine daily.

—— BUILDERS OF ——

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

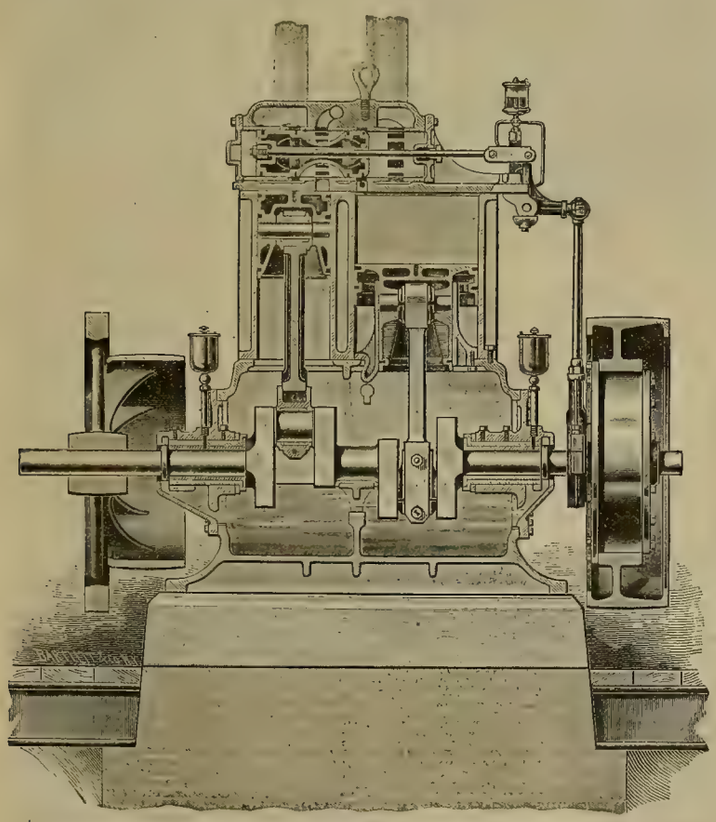
The Westinghouse Engine.

Engravings are given on this page of the improved Westinghouse compound engine. Several of this type are in use in this city, the Palace hotel having one of 100-horse power and the Baldwin hotel one of 85-horse power. The agents, Parke & Lacy, have lately placed a 35-horse power engine on the steamship Australia. The Haywards (Alameda county) Electric Light Co., which had been using another form of 11x16 engine to furnish twenty-two 2000-candle power arc lights and ninety 16-candle power incandescent lights, found it took 1850 pounds of Seattle nut coal for six hours' run. A 10 and 18 by 10 Westinghouse compound engine has just been substituted which does the same work on an average coal consumption of 1000 pounds, all the conditions being the same. As coal costs money in California, this saving of nearly one-half is appreciated.

At the mammoth sugar refinery of Claus Spreckels at Philadelphia there are 31 of these Westinghouse engines as part of the power plant. Fifteen of these engines, each of 60-horse power, are for driving the centrifugal driers, each engine being coupled direct to its own drier, dispensing altogether with line shafting. The investigations on the part of Mr. Spreckels, together with his architect and engineer, which led up to this arrangement, were unusually interesting and complete. An entire set of apparatus was shipped to the Westinghouse Machine Co. at Pittsburg, together with a supply of raw sugar and the necessary workmen. The plant, including the engine, was duly erected, and the processes gone through with and the sugar refined on the spot. The power required, and cost of same, was thus carefully ascertained, and the order for engines placed accordingly.



FOOTBOARD AND STEPS OF WESTINGHOUSE ENGINE.

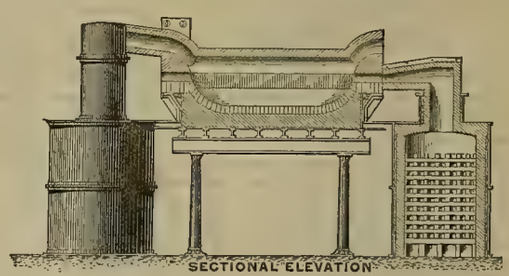
A specific description of the Westinghouse compound engine is scarcely necessary since the public, already familiar with the Westinghouse standard and junior engines, will understand the readiness with which this type of engine lends itself to compounding. In general form the compound engine more nearly resembles the junior engine. The mechanical characteristics of the single-acting engine are retained in every particular. One cylinder is enlarged to practically 3½ times the area of the other. The valve chest is across the top of the cylinders, being the construction which admits of the least possible clearance in the l. p. cylinder. The valve chest is in one piece, the various steam passages being chambered in it. The valve seat is in the form of a bush, in which the ports are cut—not cast—to an exact register. This bushing is reamed out and forced steam-tight into its bored seat.

The valve chest also contains a small by-pass valve controlling a cored passage, by which live steam can be admitted to the l. p. cylinder, to turn the engine over its center when starting. The steam and exhaust connections are on the side of the valve chest toward the back of the engine, bringing the throttle valve into convenient position, and admitting of the ready removal of the valve chest when desired.

The valve functions on both cylinders are performed with theoretical perfection by the most simple and direct mechanism, the equivalent for which in the previous types of automatic compound engines is from four to eight valves, with one or more eccentrics and rods, and a formidable train of releasing and other valve gear.

The larger compound engines of 100-horse power and upward may require an elevated foot-board for convenient access to the throttle, by-pass, etc. A cut is given of an engine fitted with this foot-board and steps.

LONGITUDINAL SECTION OF WESTINGHOUSE COMPOUND ENGINE.



The Batho Furnace.

The Batho furnace, shown in the cuts herewith, is one of the best forms of open-hearth furnaces yet devised. It was recommended and its advantages were described by Messrs.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Where Are There Fossils on the Gold Belt?

EDITORS PRESS: — As you are probably aware, an investigation of the Gold Belt of California by the U. S. Geological Survey is now in progress. The area embraced extends from the crest of the Sierra Nevada to the Sacramento and San Joaquin valleys, and reaches from Quincy, Plumas Co., to the neighborhood of the Yosemite valley. The topographical maps (of which half are done) are contoured and will be published on a scale of two miles to the inch, with the geology indicated as minutely as the scale will permit. Maps on larger scales will be made of particularly important localities. When completed copies of all of them will be sold, with the explanatory text by the Government at the cost of reproduction.

The geological investigation of this area, containing about 12,000 square miles, will be pushed as rapidly as is consistent with thoroughness; but, at best, it must occupy a number of years. For the sake of hastening the work I desire to make an appeal to your readers:

A large part of the area of the Gold Belt is occupied by schists, slates, quartzites and limestones, which ordinarily stand in a nearly vertical position, or are much disturbed and tilted at all sorts of angles. In these rocks fossils are known to have been found at a very few points, and these remains indicate that formations of at least three distinct ages are involved; viz., carboniferous, jura-trias and neocomian. The known fossiliferous localities however are so few, that it is impracticable by their aid alone to map the formations. To furnish satisfactory maps of the Gold Belt we must find more fossiliferous localities, and we are making every effort during the field work to discover them. But in a region so extensive and so scantily supplied with remains, it is largely a matter of chance whether one hits upon a fossil-bearing bed or passes it by.

Now it seems to me in the highest degree probable that some of your readers, miners, school-teachers and others interested in natural phenomena are aware of places where fossils are to be found, but have never called public attention to them. I desire to appeal to all such for aid. In return for authentic information, they will receive public acknowledgment in the reports of the Survey, and I shall be able to extend to them some limited facilities for acquiring advance sheets of maps, but I can offer no money.

Fossils in the beds in question will in all probability be only shells, or rather the impressions of shells with little or no material recognizable by itself as shells.

I request that information be addressed to me, and ask that the descriptions of localities may be as minute as possible, so that a collector may lose no time in finding the exact spot.

Definite and characteristic fossils have so far been found at the following localities: The ridge to the west of Gennessee valley in Plumas county, and to the east of Taylorville; Parrish's ranch, northeast of Pence's ranch, in Butte county; in Sailor canyon, southeast of Cisco; in a railroad cut one mile west of Colfax; in Big canyon, north of Placerville; near Robert's ferry, on the Stanislaus river; the Mariposa estate north of Bear valley.

Imperfect or uncharacteristic fossils have also been found in the limestone at Cave City, Calaveras county, near Colfax, and elsewhere.

Yours truly, GEO. F. BECKER,
U. S. Geologist in charge.

Address: San Francisco.

Prescott, Arizona.

EDITORS PRESS:—Most every new-comer to Prescott expresses himself agreeably surprised in finding our town one of the most delightful and pleasant mountain cities on the Pacific Slope. Surrounded on all sides by pine-clad hills, with Thumb butte and Granite mountain as stern sentinels holding watch over the beautiful panorama beneath them, our little community of about 2000 inhabitants does certainly appear inviting to those who wish to dwell among the mountains, in an altitude of over 5200 feet above the level of the sea, and in an unsurpassed-all-the-year-round climate. The summer heat is never oppressive, because of the air being so light, pure and dry, and the short winter seasons scarcely enable us to harvest a crop of natural ice of three to four inches in thickness.

Prescott, the county seat of Yavapai county, is the present southern terminus of the Prescott & Arizona Central Railroad, which at Prescott Junction connects with the Atlantic & Pacific line of railroad. In the business portion of the town we notice several substantial brick and stone buildings, while the majority of dwelling-houses are handsome and neat cottages, surrounded by shade trees and lawns. The city has water works, electric light, an excellent fire department, consisting of one hook and ladder company and three hose companies, and a large and roomy city hall, and in the center of the plaza stands the county courthouse, an elegant and noble-looking building.

The country surrounding Prescott on three sides to the east, south and west is one vast mineral range, where gold, silver, copper and lead are found in countless veins and deposits. There are upward of 12,000 locations entered on the records of the county, and reports of new discoveries are daily coming in. Until recently but little attention was paid to any ore that did not contain over $100 worth of the precious metals; but things are gradually changing for the better, and already several mills with concentration machinery are being put up in the different districts for the purpose of reducing the bulk of the millions of tons of low-grade ores. The erection at Prescott of general reduction works, which will treat all the rich ores from the different districts, and also the concentrates coming from these mills, is only a matter of time as a natural consequence of progress in developing the mineral resources of this section of Arizona.

The prospects of getting the railroad extended to Phœnix and the great agricultural valley of the Salt river are very good, and altogether the future looks very bright and promising for Prescott. JULES BAUMANN.

West Side Coal Mines.

Cheap fuel has been and still is a great desideratum in connection with manufacturers' interests in California, and especially in the interior valleys, which are practically treeless. The discovery of coal on the West Side is a matter of importance to Fresno, and in fact to the entire San Joaquin valley. Wellington coal is now $14 per ton in Fresno. All foreign coals must come by way of San Francisco, and the cost of unloading from ships, transferring loading on cars and carrying it inland is very great. Coal that is mined in the great interior valley, therefore, can be placed in the market cheaply. Fresno coal is delivered in this city at present for $5 per ton. Considering its quality, this is very cheap.

The West Side mines were formely owned by Robinson & Rawlins, but are now under the control of a corporation which has a capital stock of $300,000, and are on a sound financial basis. The mines are situated three and one half miles southwest of Coalinga, a station on the Huron extension of the Southern Pacific railroad.

The principal vein is four feet in thickness, with a pitch of thirty degrees. This vein is intercepted by three tunnels, with the usual breasts, and air shafts.

Mr. George W. Hawxhurst, with whom the writer has been acquainted for twenty years, is one of the most expert mining engineers on the coast. He has had charge of mines in British Columbia and at Mount Diablo for twenty-four years past, and is thoroughly capable, besides being intelligent and upright—a man whose opinion may be relied upon. He visted the Fresno mines in 1885, and reported that there was a large body of clean coal throughout the length and breadth of the property, and that he had never seen more regularly defined strata.

The Master Mechanic of the Tulare division of the Southern Pacific has used the coal under boilers for stationary engines, and reports that the Fresno coal burns one-fourth longer than the coal he has been using, giving out in the meantime an equal number of heat units per minute.

In view of the high prices hitherto paid for coal in the San Joaquin valley, these facts have a peculiar interest.—*Fresno Republican.*

A Curious Borax Mine.

W. H. Storms writes to the Pasadena *Union* as follows: In the Calico district is a strange mine called the Borax. Usually borax is obtained all over the world by collecting the accumulations of the bi-borate of soda in the beds of dry lakes, where the borax has been left as a residuary deposit, the same as salt and gypsum. The mine referred to is a vein found inclosed in sandstone and shale, and the borax is mined the same as quartz or any other mineral; beautiful crystalline specimens of snowy whiteness are frequently found. The mine is a geological curiosity.

The origin of the borax mine is simple enough. In past ages the now nearly vertical vein was a bed of borax in the bottom of a dry lake, where the deposit had accumulated by the evaporation of the waters of the lake which contained the mineral in solution. Subsequently the water spread over the land and lake, and mud and sand were carried down into the lake and the borax was covered. This process continued until hundreds of feet of sedimentary deposit had accumulated. In the course of time these hardened and became rocks. When the main range of the Calico mountains was uplifted the borax deposit was also tilted with its inclosing rocks and it now has every appearance of a vein. It follows perfectly, however, the line of sedimentation of the adjacent rock.

A REMARKABLE CASTING.—At the Paris exhibition is shown a single casting consisting of the cylinders, valve chests and frame of a triple expansion engine. The casting appears to be sound and perfect.

Something About Quicksilver.

[Written for the PRESS by HENRY G. HANKS.]

As amalgamation, in which all those engaged in mining or metallurgy are interested, necessitates the employment of mercury, the history of the metal naturally precedes that of its use. We can trace a knowledge of mercury back to the time of Theophrastus, but it was probably in the form of cinnabar, used to paint the faces of savages long before the birth of history.

With the advance of civilization this use for cinnabar not only continued, but was more extensively applied.

Theophrastus, 300 years B. C., wrote in Greek a "History of Stones," the oldest on the subject known. An English translation was published in 1746. Another work in Latin printed in Leyden, in 1647, "Gemmarum et Lapidum Historia," by Anselmus Boetius de Boot, contains a Latin translation of Theophrastus. Both these rare volumes are in the library of the writer.

The following is the account given by Theophrastus of cinnabar and quicksilver, which probably embraces all known on the subject in his time. The reader will please remember that this was written more than 2000 years ago:

"CIII. There are also two kinds of cinnabar, the one native, the other factitious. The native, which is found in Spain, is hard and stony, as is also that which is brought from Colchis, which, they say, is produced there in rocks and on precipices, from which they get it down with darts and arrows. The factitious is from the country a little above Ephesus. It is in but small quantities and is had only from one place. It is only a sand, shining like scarlet, which they collect and rub to a very fine powder in vessels of stone only, and afterward wash in other vessels of brass, or sometimes wood; what subsides they go to work on again, rubbing it and washing it as before. And in this work there is much art to be used, for from an equal quantity of sand some will make a very large quantity of powder, and others very little or none at all. The washing they use is very light and superficial, and they wet it every time separately and carefully. That which at last subsides is the cinnabar, and that which swims above in much larger quantity is only the superfluous matter of the washing.

"CIV. It is said that one Callias, an Athenian, who belonged to the silver mines, invented and taught the making of this artificial cinnabar. He had carefully got together a great quantity of sand, imagining from its shining appearance that it contained gold. But when he found that it did not, and had had an opportunity in his trials of admiring the beauty of its color, he invented and brought into use the preparation of it. And this is no old thing, the invention being only of about 90 years date, Praxibulus being at this time in the government of Athens.

"CV. From these accounts it is manifest that art imitates nature and sometimes produces very peculiar things, some of which are for use, others for amusement only, as those employed in ornamenting edifices, and others both for amusement and use. Such is the production of quicksilver which has its uses. This is obtained from native cinnabar rubbed with vinegar in a brass mortar with a brass pestle and many other things of this kind, others perhaps may hit upon."

Aristotle, who was only nine years older than Theophrastus, has informed us that Dædalus the Athenian inventor, imparted the power of motion to a wooden statue of Venus by pouring in quicksilver. It is also stated that he learned this art from Egyptian priests. But as he is supposed to have lived 1300 years B C., and by some authors is regarded as a myth, Aristotle probably obtained his information from tradition, and, as Herodotus and Moses do not mention that metal, there seems but little foundation for the story.

The only known important localities of mines of mercury in Europe are Spain, Austria and Hungary, and as there are but few mines in Asia and Africa, the Egyptians were probably ignorant of its existence. The story that the Egyptian magicians, in attempting to imitate Moses' serpents, used mercury, must be accepted with caution. It seems next to impossible that they were acquainted with sulpho-cyanide of mercury, of which the modern so-called "Pharoah's serpents" are made.

Theophrastus was an intimate friend and favorite pupil of Aristotle in Athens, and received all his manuscript by bequest. In his celebrated work, "History of Stones," quoted above, he quite ignores the Dædalus story.

Pliny, Dioscorides, Vitruvius and Diodorus Siculus wrote of mercury, but they were nearly contemporary. The lived in the first century, except Vitruvius, whose birth dated back to 46 B. C. All living several hundred years after Theophrastus, it is fair to assume that his mention is the first reliable one in history.

The Romans knew of the Almaden mines long before they were so named, and also those described by Theophrastus. The emperors, taking advantage of the universal admiration for brilliant colors inherent in man, added greatly to the public revenue by controlling the production and sale of vermilion. So great was the demand for this beautiful pigment that the government found it greatly to its advantage to take possession of the Almaden mine, then situated in the town of Sisapon in Bœtica. It was not lawful to work the ores at the mine, but they were brought to Rome with great care in sealed packages, and there purified by a treatment described elsewhere. Two thousand pounds only were imported annually from Spain. Even the price was fixed by law at 70 sesterces per pound (about two dollars and fifty cents).

Metallic mercury was discovered by accident. It will be shown elsewhere that the metal could not have been produced by the process described by Theophrastus, unless his ore contained native mercury, which, however, is not improbable; but he must have seen the metal, and evidently knew no other method of obtaining it.

The next account we have was written 300 years later, or about the date of the Christian era.

Vitruvius was a Roman architect of note, a military engineer under Cæsar in Africa in the year 40 B. C. His life is but little known; his great literary work undertaken and finished in his advanced years treats mainly of architecture. The work was translated into English in 1730, in 1771, in 1812 and in 1826.

He thus describes the preparation of cinnabar and the reduction of a small quantity of metallic mercury.

"They dry the cinnabar in furnaces in which, along with the moisture of the ore, arises a vapor which condenses on the floor of the furnace, forming minute drops which are quicksilver, and which swept together, put in a vessel and washed with water, gradually unite and end by forming one mass. The dried ore is ground up in iron mortars and submitted to repeated calcinations and washings until it acquires the desired color."

Pliny about 70 years later thus refers to the same subject:

"There is a mineral also found in these veins of silver (in Spain) which yields a humor that is always liquid and is known as 'living silver.' It acts as a poison on everything, and pierces the vessels even, making its way through them by the agency of its malignant properties.

"To the fluid humors of minium (cinnabar) we have given the name of quicksilver, for if these are subjected to the action of fire, they will yield silver."

Metallic mercury being discovered, it began to be put to use in a limited way. The art of amalgamation, supposed by many to be a modern invention, was known in the time of Vitruvius, who wrote as follows:

"And when gold is woven into a garment, and that garment has no longer honorable use on account of age, the rags are placed in earthen vases and burned over a fire, the ashes are thrown into water and quicksilver added to them. This collects all the particles of gold to itself and forces them to stay with it. When the water is turned off this is poured into a cloth and the quicksilver is pressed by the hands through the coarse meshes of the cloth. On account of its liquid state it falls outside, and the gold collected by pressure is found pure within."

There is historical evidence that the quicksilver mines of Spain were worked by the Moors, but mainly for vermilion, which they used extensively in decorating their palaces.

Abd-er-Rahman III, or Abdalrahman, was first Caliph of Cordova. Beginning his reign in the year 912, he raised the Mohamedan Empire to its highest state of glory. One of his palaces was named from a favorite slave "Medina Azahra" or "Zahara." It was near Cordova and about 60 miles from the Almaden quicksilver mine. It was magnificently built and decorated. Historians state that one room, the audience chamber, was enriched by gilded statues, that the roof was covered with pure gold, and that in one of the gardens was placed a porphyry tank or basin into which flowed a continual stream of quicksilver.

While this statement may reasonably be doubted, other accounts refer to a porphyry basin filled with mercury, which was used as a mirror and described as reflecting the rays of the sun and moon with great effulgence. Some writers assume that either this palace was a myth or that the descriptions were greatly exaggerated, but it is asserted that there was a palace of this name, that it was also a mint, and that for a long period all the Moorish money was coined there, and that such coins are common with the mint mark "Medina Azahra."

Gibbons' account of this city, palace and garden of Zahara places it within three miles of Cordova, and states that 25 years were consumed in its construction, with an expenditure of 3,000,000 pounds sterling. The buildings were sustained or adorned by 1200 columns of the rarest and the most costly marbles. The audience chamber was incrusted with gold; in the center of the garden, under a lofty pavilion, were placed basins, one of which was filled with the purest quicksilver.

If dependence may be placed upon these historical accounts, it is interesting to know that as early as the tenth century so large a quantity of quicksilver had been collected when no special use for it was known.

The writings of the Arabian physician Rhazes prove that in the tenth century the Almaden mine was worked for mercury and cinnabar, and that the metal and mineral were obtained from that source which Geber used in the preparation of the mercurials, corrosive sublimate and red precipitate; Arab coins, too, have been found in the old workings, some of which, bearing the portrait of Sancho IV and coined in the thirteenth century, were discov-

ered at the end of the last century in the foundation of an ancient furnace near the Castello mine. The Greek name was changed by the Moors to the Arabic one "Al-maden," meaning "the mine." Our word mineral has the same origin. The technical terms, Almadenejos, Azogue, Nabecas, Desmijar, Ahajarrar and Aludel, appearing as they do frequently in the chronicles, show conclusively that these people worked the quicksilver mines of Spain extensively in the middle ages.

From that period until the discovery of America, and the silver mines of Mexico, Bolivia and Peru, mercury was produced in a small way in various parts of the Old World, and as civilization still advanced, it became better known and was put to practical use, but to no great extent.

In 1545 the great silver mines of Potosi in Bolivia were found. This important discovery was followed by those of other mines and districts in South America and Mexico. In 1548 very productive silver mines in Zacatecas, Mexico, and others in Cerro Pasco, Peru, were opened and extensively worked.

The Spaniards, who had devastated America in their search for gold, reluctantly turned their attention to the less noble metal, silver, which for many years was enormously produced; with what effect on Spain, and indirectly on the Old World, is graphically pictured in the writings of Robertson, Raynal, Jacobs and Chevalier.

The conquerers found the Mexicans working the ores of the small mineral veins they knew of by a rude system of metallurgy, which was in effect a simple smelting process. These methods were continued, with some improvements, until 1557, when Bartholome Medina discovered or invented the Mexican Patio process for extracting the metal from low-grade ores in a large and more economical way, using quicksilver for the first time, as far as is known, in the reduction of ores containing no free silver or gold. Mercury had long been in use in Hungary and elsewhere for the collecting of native gold, but the Spaniards were the first to amalgamate raw ores and decompose them by treatment and amalgamation.

Medina was a native Mexican miner, ignorant of scientific metallurgy, and it has ever since been a source of wonder to metallurgists how he could have invented a process which proved so successful that it is still employed in Mexico and South America, with but little change from his system of manipulation, as described in the writings of metallurgists of his time. The new process was soon extended to all the silver mines in Spanish America, creating a demand for quicksilver never before known.

In 1639, Alfonso Barba's work on amalgamation appeared in Peru, and Gabriel Plattes, in the same year, described in an English work the amalgamation process for saving gold and separating silver from its ores. Barba's work, "El Arte de Los Metales," was republished in Madrid in 1640, and is believed to be the first work ever written on the art of amalgamation. In it the Medina process is described in detail.

In the year 1566, Don Pedro Fernandez de Velasco applied quicksilver to the extraction of silver from its ores, first in some mines in Mexico and afterward, in 1571, in similar mines in Peru. It was thought by some authors that he was the inventor of the process, but he probably copied the method of Medina. Be this as it may, the new process was soon introduced into all the silver mines then known. It revolutionized and cheapened the production of gold and silver. While low-grade ores were treated by this process, the richer ones were for a long time smelted as before.

Until the discovery of the Peruvian quicksilver mines of Guancavelica in 1564, all the mercury used in the American mines was sent from Spain, which did not cease until the great Santa Barbara mine began its enormous yield.

Some idea of the importance of this mine may be gained by the following figures:

From 1570 to 1789, the product, according to Humboldt, was 47,285 tons of the liquid metal. From the latter date the yield began to decline, and up to 1845 was only 3000 tons. When silver mining became less productive there was a period of comparative inactivity in the production of mercury, although it was still somewhat largely consumed in the arts and in medicine as well as in mining, until the discovery of gold mines in California followed by similar excitements in Australia, New Zealand and elsewhere, which gave a new impetus. And had it not been for the fortuitous discovery of an abundant supply of the indispensable metal in California, much of the gold taken from our placers would have gone to enrich syndicate owners of European quicksilver mines.

The ancient Greek name for mercury was hydrargyrum, literally "silver water," Latinized by the Romans. The modern chemical symbol (Hg.) is an abbreviation of this word. Another Latin name "argentum vivum," led to the modern English one, quicksilver. The ancients not being chemists, judged all bodies by their physical properties. They believed hydrargyrum to be silver in some allotropic condition, and made a distinction between "argentum vivum" (native mercury) and "hydrargyrum," the same metal obtained artificially.

Another name given by the ancients was: Water that does not wet the hands "aqua non modefaciens manus." If it does not wet the hands, it wets other metals to that extent that it must be driven off by heat before it will relinquish its hold. The alchemists named the metal from the Greek mythological diety Mercury, and represented it by the caduceus or winged rod of that god, intwined by two serpents, or a modification of that symbol. The Spanish word "azogue" is of Arabic origin.

It is curious now to trace the interest taken by the alchemists and older scientists in this remarkable metal, and the following list of names by which it was known will show how frequently it must have been referred to in alchemistic and older writings.

Ancient, Modern and Alchemistic Names and Synonyme for Mercury.

A. Adib, adibat, æterni, alcarith, alcharith, alecharith, alembic, alembicum, alemarcasita, alkant, alohar, alohoc, alogar, aloeat, alosohoc, altaris, altarit, aludit, anatris, an fir filius, anterit, aqua argentea, aqua non modefaciens manus, argentum fusile, argentum fusum, argentum mobile, argentum vivum, arohot, argentum liquidum, argentum aqueum, avraric, azoc, azoch, azoth, azogue, azot.

B. The letter B.

C. Cheizi, chesmech.

D. Dædalus.

E. Ebeemech.

F. Fugitivus servus, fumus albus.

G. Geryon.

H. Holy-water, hydrargyrum, hydrargyrus, hidrargirum.

CLOVER CREEK FALLS IN THE SHASTA REGION.

L. Liquor metalicus, lorus, lunificus, liquor ætenalis.

M. Massalis, massarium, mater metallorum, mercury, mercurius, mercure, mercure vierge, metallum fluidum, mussalis.

Q. Quicksilver, quecksilber.

S. Spuma argenti.

U. Uxor.

V. Virgin mercury, vif argent, vomica liquoris æterni.

W. Water of metals.

Z. Ziabec.

THE USE OF A GOOD MATERIAL THE BEST ECONOMY.—That economy lies in the use of a good material, and not in cheap stuff, says the *Master Mechanic*, was well illustrated on one of the large Ohio roads recently. The newly appointed superintendent of motive-power found that the valve oil used on the road was a mixture of black oil and tallow, the total cost of which was 32 cents per gallon, and that the average mileage per quart was 100 miles. He also found that one valve seat was being faced every day in the shops. A change was made to valve oil costing 50 cents per gallon. This is giving an average mileage of over 200 miles per quart, and it has been necessary to face only five valve seats in four months.

A LARGE deposit of petrified clams has been found near the top of Flat Butte, Mont.

SENATOR JONES of Nevada has given $10,000 for building a new pier at Santa Monica.

Alaska Gold Mines.

A correspondent of the Santa Rosa *Democrat* says:

A year ago Alaska had only one paying quartz-mill; now she has a number of small mills running with success. The principal mill is, as every one knows, at the famous Treadwell mine. This mine has been worked for a number of years. The loose dirt and decomposed quartz were sluiced, which paid for several years, but finally the largest portion of the loose gold being washed out, and the value of the quartz not being known to its owner, the mine was sold to the Alaska M. and M. Co. for $1500, both parties being well pleased. Shortly after this company gained possession, a 180-stamp mill was built, which has run since that time. Last year 160 more stamps were added, making 340 in all.

The next mill in size is the Bear's Nest. Last June a company was organized below under the name of the Alaska Gold Co., with a capital of $2,500,000, having Charles E. Benn of London, England, for president. This corporation purchased the Bear's Nest group, embracing the largest portion of five claims, and located on this island. Early in July this company commenced active operations by having a tunnel surveyed and setting a force at work on the same, and have continued work since that time. The tunnel enters cover a little above high-water mark, or about 100 feet below that of the Treadwell, which joins it on the south. It was estimated by Deputy U. S. Mineral Surveyor G. W. Garside that the tunnel would have to be run in 1052 feet before the ledge could be tapped. Last Tuesday the ledge was tapped at a little less than the estimated distance. After tapping the ledge (which indicates well and promises to be equal if not superior to its sister ledge, the Treadwell) and penetrating a short distance rich ore was found, which assays $500 to the ton. It is not ascertained yet whether it is a body of ore or a stringer, but it is supposed to be the latter.

This property has gained wide-spread notoriety from the price paid for it, $2,500,000. The eyes of the ledge-holders of Alaska have been watching its development closely. It has at last given this country a lift. On April 22d the steamer Ancon landed here with 24 carpenters in the employment of Grant & Grady of California, who have the management of the erection of the buildings on the property. The sawmill belonging to the A. M. & M. Co. was leased, and has been running night and day since that time till a few days ago, when the night shift was taken off. The boarding-house accommodates 200 men. The mill will be taken to its site as soon as the railroad is finished. The latter will run from the A. M. & M. Co.'s wharf to the sawmill by the Bear's Nest mill site. This road will be less than a mile in length, and will be the first railroad in Alaska.

Other properties here are fully as good as the two which I have described, but they are owned by poor men, and, the rock being of low grade, it requires considerable capital to work it with success. In the hands of capitalists of means such property would be a bonanza. Alaska is young in her mineral discoveries, but as soon as capitalists get enough of her property in their hands she will grow rich and prosperous. At present this country is not good for a workingman, as wages are low and most of the work endangers his health through exposure.

A rich ledge was discovered about 60 miles below this place, which has created quite an excitement. It is reported to be of an immense size, and assays 500 ounces of silver to the ton. The rock also carries 17 per cent copper and a trace of gold. In regard to the Yukon mines, there have not been any very rich strikes made among them yet, as there are only three months in the year suitable for work in that region, and to winter there costs a person at least $500. Sluices cannot be worked, as the river has not fallen enough to get water at the bars. Ground that a man cannot rock out $17 a day will not justify him to work. It is reported that there will be a steam pump or two taken in by the mouth of the river this spring, and it is generally believed they will be successful, as there is ground there where a man can rock from $5 to $8 a day, but it will not pay him, because he cannot sluice it. If he could, it would be a fortune to him. This the steam pumps will remedy. The only men who made even moderate wages there were those who had extra ground and stayed with it two or three years. The largest sum that any person came out of there with was about $12,000. A number have come out with from $3000 to $10,000.

Ivanpah Mines.

One of the oldest and most successful mining and milling operators on the coast, Mr. J. A. Bidwell, is in the city. In 1866 Mr. Bidwell was sent to California by a Wall-street syndicate to look after some mining property, and it resulted in his remaining here permanently, and there are few men who have a wider acquaintance with mines and miners. During the past eight years, Mr. Bidwell has been operating in the silver and lead mines at Ivanpah, and with great success. The camp is made up wholly of miners and a few supply stores. It is 75 miles from Fenner, the shipping-point on the Atlantic & Pacific railroad, in the desolate, arid country, not many miles south of Death valley. One would think that life would be a burden up there, but its dreariness is compensated for by the wealth its inhabitants are accumulating. There is no richer silver and lead district in California, and, with the coming of the Salt Lake road, there will be beyond doubt a great influx of capital and very extensive operations. Speaking of that much-talked-of and hoped-for road, Mr. Bidwell is decidedly emphatic that the road will be constructed. There can be no doubt at all about it, he thought. In fact, the gentleman is possessed of some information which makes it a certainty.

He has been all over the country through which it will pass, and says the construction will be attended by very few serious obstacles; that nearly all the route lays through a region where the work will be comparatively easy. The particular result thus to be reached would be the opening of the iron deposits at Iron mountain, Utah, where iron and coal abound, and can be easily worked. There is all the water that can be desired, and the conditions are such as to make it inevitable that great iron works would be established there.

Mr. Bidwell says that the people at Ivanpah are very confident the line will be built soon, and that it will come very close to that town, and the result will be, a vast region will be thrown open and made accessible. A very rich lead deposit, the best that has ever been found in the West, would be tapped by the line, and the country become directly tributary to Los Angeles.—*Los Angeles Tribune.*

CLOVER CREEK FALL.—We give on this page one of the smaller gems of the scenery of the Shasta region, the falls in Clover creek, which are situated about 40 miles northerly from Redding. The scene, as the engraving shows, is wild in the extreme, and is made up of rocks with their scanty, clinging vegetation, as the environment of the waterfall, which is of no mean dimensions. The scene has elements calculated to please the romantic, the nature-loving, or the piscatorial mind, and is another reminder of the delights of the mid-summer outing upon which the PRESS has frequently expatiated.

CORPORATIONS CAN LOCATE MINES.—The Supreme Court of the U. S. has decided in the case of Alexander B. McKinley, plaintiff in error vs. Jerome B. Wheeler et al., that a corporation created under the laws of one of the States of the Union, all of whose members are citizens of the United States, is competent to locate or join in the location of a mining claim upon the lands of the United States in the like manner as an individual. This decision has been rendered upon an appeal from the Circuit Court of the United States for the district of Colorado that had decided to the contrary.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO.—Amador *Ledger*, July 6: Mining matters are looking up considerably at Volcano. The operations on the Cleveland cement and gravel claim are likely to bring the camp into prominence once more as a mining center. The roller mill was started on its career of pounding out the gold from the hard cement, and it not only works well, but the yield of gold is said to be satisfactory. There are between 20 and 30 men employed on this claim. The number of employes is being steadily increased, and it is expected that it will give employment to 40 hands when in full blast. The Loyal Lead property in the Black hill, near Drytown, has been bonded to an English Co. for four months for $40,000. At a meeting of the Alpi directors last week, it was decided to have a five-stamp mill put up on the claim at once, and B. F. Taylor was authorized to make the necessary arrangements.

THE ZEILE sulphuret works were started up this week. The work of repairing the shaft is completed, and in a few days it is expected that all the stamps of the mill will be in motion once more, for a long and continuous run. A new 12-inch pipe is being laid from the South Spring hill reservoir to the mill. Ten stamps are to be added to the mill, for the purpose of being employed on rock from the Talisman, and the increased water supply is thus rendered necessary. The Allison mine above Big Bar bridge, owned by Tripp and Petrie, is running a low grade ore, which does little more than pay running expenses. There is said to be plenty of better rock in mine, below the tunnel level. Sinking operations will have to be inaugurated before this can be worked.

Calaveras.

THE LAVA BED GRAVEL MINE. — Calaveras *Chronicle*, July 6: This mine is situated in Railroad Flat Mining District, about one and a half miles south of the town of Railroad Flat and near the road leading to El Dorado. Messrs. Lampson, Evans & Co., the owners, have been prospecting this mine for five years, but never with much success until about eight months ago, when they at last reached the long-expected channel. They have done their work through shafts, there being no chance to tunnel without running a great distance. The first shaft they sunk was 57 feet to the bedrock, or north rim of the channel. An incline was run from this shaft following the bedrock a distance of 75 feet, when they found the "wash," but the water came too fast for them to handle through the incline and shaft, and work was abandoned in that place. They then went south, a distance of 200 feet and sunk another shaft. This time they found what was supposed to be the south rim. This shaft was 52 feet deep, and they run an incline 35 feet on an angle of 45 degrees. About 20 feet from the shaft they came to the channel which prospected well and gave indications of an extensive mine. At the end of the incline the bottom of the channel was reached, when a drift was run north, or across the channel, a distance of 20 feet, one east, or up the channel, 50 feet, and one down 12 feet. The gravel from these drifts was all washed just as it came out, the drifts being about six feet high and all in gravel. The output was three dollars to the carload. With this prospect and the extent of their claim the owners feel confident of having a valuable property. They have about one and a half miles in length on the channel. The company have this spring put up a whim to hoist the gravel and water, and built a dump box with a capacity of 140 carloads, and 300 feet of flume running from it. The blue gravel will be washed in this box with a small hydraulic. The shaft has been substantially timbered and lined, and the drifts are now being widened preparatory to breasting out gravel.

THE THORN MINE.—*Prospect*, July 6: The "Ben Thorn" mine near San Andreas, has been bonded to H. H. Allen, a gentleman from San Francisco. It is understood that this gentleman will immediately sink on the 80-foot shaft which is already there, and will, in a short time, if the mine proves satisfactory, build a mill. It is said that the gentleman named above is pleased with all the present indications of the mine and will thoroughly work it. B. K. Thorn reserves an interest in the mine.

El Dorado.

PLACERVILLE.—*Observer*, July 9: Sinking is going on regularly at the Pacific shaft. The company is now making a sinking of 300 feet from the 700-foot station, which will give them a depth of 1000 feet, where a station will be established from which crosscuts will be made to different ore chutes contained in the group. It is not intended, as we are led to believe, that sinking will cease till the shaft has reached a depth of 1600 feet, which will give (after crosscuts have been made) ore backs sufficient to supply a large number of stamps for a length of time not now to be estimated. The west crosscut from the 700-foot station, is nearing the Rose ledge. When this connection is made, ore can be rapidly brought to the surface from both the Rose and Pacific shafts. A large vein of excellent ore is now shown in the Rose shaft. Prof. Price is not at all excitable and accepts no theory for fact, still he is well pleased with the large ore body developed in the opening of this shaft. The ore is of high grade. The company has its mill about ready to run. They are putting in as an experiment both Frue and Golden Gate concentrators, and after testing them, will decide which, if either, they adopt for general use. Work is being prosecuted as rapidly as possible in enlarging the shaft to the 400-foot level at the Church mine. It is the intention after the enlargement is complete to make another sinking of 200 feet. A few men are working at the Vandegrift mine with very flattering prospects. They have a ledge four feet wide of ore showing well in free gold and sulphurets. At the True mine the main tunnel is now in nearly 2000 feet in vein matter. Several chutes of good pay ore have been run through on the line of the tunnel. They are now making a crosscut to strike the west wall. Stringers of ore are found. Mr. Chas. J. Parker informs us that work is now being prosecuted at the Stillwagon mine, south of Grizzly Flat. At the 1600-foot level, at the Springfield mine, there is a ledge 16 feet wide of ore of fair grade. It is expected that new hoisting works will be placed on this mine before long. The north drift at the Rogers mine, Smith's Flat, is running into a promising bench of gravel. Good prospects are being found in the Stewart mine at Weaver hill.

Fresno.

THE OLD HARRON MINE.—Fresno *Expositor*, July 9: In February last Clark & McKenzie bought into the mining property known as the old Harron mine, together with J. C. Hoxie and W. L. Witt, both experienced miners. The new firm determined to commence at once and develop the mine, and starting two incline shafts they have pushed steadily forward until both shafts have reached about 100 feet below the surface. The shafts follow the ledge of rocks, which on the surface is six inches wide. But one shaft has now reached a point where the ledge is some 20 inches wide, while the other shaft has developed a ledge of gold-bearing rock six feet wide. On Saturday last Messrs. Clark & McKenzie paid their mines a visit, and on their return last night they brought with them amalgam to the value of about $950. Mr. Clark was found in his office to-day by a reporter, and asked for some facts. He was not anxious to talk, "for," said he, "we don't want to sell the mine, and have no special desire to advertise it. However, I have no objection to telling you what we have done. We began working ten men in February last and have kept them steadily at work. Any one familiar with mining will appreciate the expense we have been under by sinking two shafts 100 feet in depth each, building an arastra and keeping our hands, besides the hundred and one little things that all count up in the course of a month, and yet our mine has not only paid every dollar of this expense, but netted a little surplus. The mine is situated on the headwaters of the north fork of Little Dry creek. We did not commence crushing our rock until March last, and have crushed only the best rock since that time. The arastra, you know, is a primitive method of reducing quartz or rock. The process is very slow. I presume that with an ordinary 10-stamp mill we could have crushed in one day all the rock we have reduced in the arastra since March last. For this reason we have used only the best rock, and it has averaged from $70 to $130 per ton. And without any desire to boom the mine, for, as I said, it is not in the market, I can say there has been far more tons at $130 than at $70. The low-grade rock we have piled up at the mine, and if our speculations are realized we will soon put in a 10 or 20-stamp mill. I say our expectations, but in reality we expect nothing. The second-grade rock ought to run from $20 to $50 or $60 a ton, and with a mill that will pay us handsomely to handle it.

Inyo.

THE OLD PLAGUE.—*Independent*, July 6: That old curse of the mining industry, that has been so fruitful of evil all over California, has fallen upon the Maxim property. A little over five years ago, Harris & Rhine of Independence were appointed the legal agents and representatives of the Maxim Mill and Mining Co. The mill was sold for taxes and was bought by Harris & Rhine. The firm supplied goods to the company, and quite a bill was run up. When Mr. Harris retired from the firm, all claims against the property passed to Mr. Rhine. Last December Mr. A. Davidson, as the representative of the Maxim Co., made an agreement with Mr. Rhine, by which he bound himself to pay the latter what was claimed by him, amounting to over $5000; said payment to be made on or before July 1st of this year. Should this agreement not be made good by Mr. Davidson, Mr. Rhine was then to have the property. About two weeks ago Mr. C. H. McConnell who is interested in the property came here from New York. Mr. Rhine being in San Francisco, he went there to meet him and try to effect a settlement. This, it appears, could not be done, and on Monday last a complaint was filed on the part of the Maxim Mill and Mining Co. against Nathan Rhine. This is almost certain to tie up the mines and mill for a long time to come.

CERRO GORDO.—*Register*, July 4: Archie Farrington came up Tuesday on the train. We learn that the Cerro Gordo mines are bonded by a strong syndicate, which he represents, and that the indications for new life for that camp are favorable indeed.

Napa.

QUICKSILVER SHIPMENTS.—*Calistogian*, July 3: During the month of June quicksilver produced at the mines below mentioned was shipped from Calistoga as follows:

Napa Con. Mine,	flasks	385
Bradford,	"	188
Sulphur Bank,	"	212
Lynn Bros.,	"	3
Total flasks		788

The Napa Con. Co. paid another dividend of 10 cents per share Monday last.

Nevada.

EAST EUREKA MINE.—*Tidings*, July 2: Supt. Weldon of the East Eureka informs us that his company has determined to put in a compressor drill, which has already been secured, and to sink the shaft an additional hundred feet. The steam plant on the mine is adequate to furnish the extra power. The East Eureka is 500 feet in depth, and from this level a crosscut has been run and the fissure found. The company has been disappointed, however, for the walls (well-defined and identical with those enclosing the Idaho ledge) are close together, while 200 feet above they are from 7 to 12 feet apart. A strong stream of water flows from the fissure in the crosscut from the 500-foot level. This is a very favorable indication, and better walls could not be asked. Although disappointed, Mr. Weldon is positive that with the additional hundred feet in depth he will have a mine.

THE IDAHO MINE.—*Tidings*, July 8: This morning the bulkhead between the 700 and 800 foot levels of the Idaho mine was removed and preparations made to expel the foul air from the levels below. No smoke or other indications of fire are apparent. A large air fan is being operated in the old pump shaft, and in the main shaft a two-foot box, as nearly air-tight as possible, is being placed in sections below the 800 level to constitute an exhaust. As the sections are put in, the air is rendered pure for a foot below the mouth of the box. A candle lowered an additional foot is immediately extinguished. The extent of the damage to the mine by the fire will soon be ascertained.

Placer.

OPHIR DISTRICT.—Placer *Republican*, July 6: C. A. Cooper says Ophir mining district never looked so encouraging as now. At the Hartley mine they have a shaft down 100 feet, from which a drift runs north 50 feet on a three-foot ledge of splendid ore. A drift also runs south 75 feet on ore which will go at least $12 a ton. This drift will be extended 150 feet further, under a contract. The old Buckeye mine which was started up a month ago is also showing rich rock, and good things are expected. The old Eclipse mine, one-half mile this side of Ophir, was also started up last week by J. B. Patterson, with four or five men. This mine has been idle for 12 or 15 years, but it is known to contain good quartz, and Mr. Patterson will put up a ten-stamp mill this summer. In the whole district there are more mines running than at any time before for 12 years.

Shasta.

IGO.—Cor. Shasta *Courier*, July 6: A Red Bluff Co. has secured an interest in the Crystal mine, and is extending the lower tunnel to strike the ledge. The same company is negotiating for the Chicago and the first extension north, with a view to working them jointly. P. Gibney is crosscutting from the bottom of his shaft. He has passed a seven-foot ledge of ore. The main ledge has not yet been reached. Robinson & Son are taking good ore out at the Black Prince. Charley Rossle is building an arastra near the mouth of Andrews creek. Asa Williams is running his arastra on fair ore. Wright's arastra is running on ore from the Andrews creek side. Shirland & Bros.' arastra is running on Atlantic ore. E. L. Ballou's arastra is running on Falls ore.

Sierra.

TELEGRAPH.—*Mt. Messenger*, July 6: The Telegraph M. Co. met on the 30th of June and organized. R. Stevenson, D. T. Cole, H. Spaulding, R. Forbes and John Costa were elected directors for the ensuing year. At the directors' meeting held immediately after R. Stevenson was elected president, D. T. Cole vice-president, H. Spaulding, treasurer, P. R. Gardner, general manager, and F. R. Wehe, secretary. In addition to the above, A. Hart, H. H. Squire, W. W. Mason and John Mitchell are large stockholders in the company. The company owns about 600 acres of what is called the Telegraph channel, supposed to be an extension of the Chapperal Hill and Eureka lead, and it is now having the ground surveyed for the purpose of getting a patent. They also intend commencing to develop the property at once. The incline on the Wallis Consolidated M. claim is now down 50 feet, it being two weeks since work was commenced. The tunnel is being put down between the bedrock and lava. The work is now in a nest of bowlders, which is not a bad sign. W. Lawry and H. M. Bradbury have taken the contract to sink to the bottom of the channel.

Siskiyou.

QUARTZ AND GRAVEL.—Yreka *Journal*, July 3: We learn that the old Lindsey quartz ledge at Oro Fino, near Fort Jones, Scott valley, is again paying very rich, Hand & Co., the present owners, having taken out nearly $1800 lately in a very short time. In the Oak Bar section of Klamath river, the river miners are getting along nicely, and must be doing well, judging from the large amount of supplies shipped every week from Yreka; and the same may be said of the Honolulu district on the same stream, also at Humbug creek, these several localities helping Yreka very materially in the way of trade and business. Leonard has about pumped out his claim at Hamburg Bar, and will soon commence hoisting pay gravel. Martin Andrews at same place is busy getting ready to pump, his wing, head and foot dam being almost ready. Osborne & Co., on the Upper Klamath, near the Anderson ferry, are about ready to take out pay gravel. Jno. Waggoner & Co. in same section are already taking out pay gravel with good success, and Wm. Pullen will commence in a few days.

Santa Barbara.

BEACH MINING.—Lompoc *Record*, July 6: The Launer Beach M. Co. washed out 12 ounces of gold Monday. This is the greatest day they have had. The black sand was so clean of the white that gold could be seen on the beach. This same ground has been cleaned several times. Each flood tide brings in its quota of the shining dust. Where does it come from and how long will it last is the query.

Tuolumne.

RAWHIDE MINE AND MILL.—Sonora *Democrat*, July 6: This property, near Jamestown, has lately been sold for a large sum by Edmund Greene of Oakland to W. A. Nevills of San Francisco. The mine is on the mother lode, the vein is strong, and was formerly worked extensively and successfully, though operations were conducted at that time without system and very extravagantly. It is now to be operated with energy and judgment and will be soon added to the many paying mining properties of this county. The mill is a first-class steam 20-stamp mill. The hoisting works, also steam, are to be removed and re-erected 500 feet to the north on the vein and a contract has been given to the Sonora foundry to do the work.

KANAKA MINE.—It is authentically reported that this mine, near Groveland, in the southern part of the county, and owned by Mr. Wm. R. Shaw, has been sold to San Francisco parties for a very considerable sum. It has now a five-stamp water-mill, and the number of stamps are to be increased to 15 and probably to 20. The mine is thoroughly opened 600 feet deep and shown to be valuable and lasting.

GOLDEN GATE MINE.—This mine situated 1½ miles from Sonora to the southwest, has been developed systematically, and the good work done on it now demonstrates its great value, having a pay chute 600 feet in length of sulphurets of unusually high grade and large percentage. Works for reducing the sulphurets and a 10-stamp water-mill are being erected, and the work has been energetically started and will be pushed. This mine is peculiarly a sulphuret mine and promises to be the leading sulphuret mine of the State. The ore carries very little free gold. The wealth of the mine is in the sulphurets. This mine, and also the San Guiseppe mine situated near Sonora, violate in a striking manner the almost universal rule, that sulphurets in a mine are usually rich in proportion to the free gold. The sulphurets of both go into the hundreds of thousands per ton, and yet neither contains free gold enough to work profitably. In this connection it is worthy of note that the Bonanza mine, in the same vicinity, that has yielded hundreds of thousands of dollars in massive free gold, contains sulphurets that are of no value. This is the reverse of the former case and another marked exception to the rule.

MARY ELLEN MINE, also situated in the southern part of the county, near Tuolumne river, is being furnished with a mill under charge of Mr. Wm. Sharwood, and the developments on the mine show that it will soon be one of the leading gold mines of this section of the State. The blanding concentrator to be placed in this mine is about finished.

SULPHURET WORKS are being built near Sonora by Mr. Maltman, and are conveniently located to the several sulphuret-producing mines. They will be employed on custom work and will supply a need long felt.

Trinity.

CANYON CREEK QUARTZ.—*Journal*, July 6: Geo. Bailey was in from Canyon creek this week, and gives us the following in regard to his new find: He discovered the ledge on the 22d of last May, and with Grant Flowers has three locations. The ledges are situated about 4½ miles from the town of Canyon Creek, near the summit of the ridge dividing Canyon Creek and Steuart's Fork. There are three parallel ledges distant from each other about 75 feet; the largest is 7 feet in width, the other two, 5 and 6 feet in width. Each ledge carries free gold and prospects well. The upper ledge on the surface is decomposed for a distance of three feet from the hanging-wall, while about as much more solid quartz adheres to the footwall. The formation in which the ledges are found is porphyry. They are now running a tunnel to tap ledge No. 1 at a depth of 50 feet, and, on reaching the ledge, can drift to any depth desired, as the ledge dips at an angle of 65 degrees. After striking the ledge in the tunnel, the owners will know whether they have a bonanza or not. If the ledge is found at the depth of 50 feet of the same character as on the surface, it will prove a veritable bonanza. Dedrick, Jones & Grigsby have some very flattering prospects on their locations.

NEVADA.

Washoe District.

BULLION.—*Enterprise*, July 6: Running north on the ledge on the 760 level. Are now distant from the shaft 175 feet.

HALE & NORCROSS.—On the 400 level the stopes in the north drift from No. 1 west crosscut continue in ore of good grade. On the 500 level the north drift was extended 21 feet. All the stopes are looking well. On the 600 level the north drift was advanced 35 feet and connected with the south drift from No. 2 crosscut. These drifts expose considerable fair-grade ore. From the 600 and 700 levels are not extracting the usual quantity of ore on account of the scarcity of water which has reduced the crushing capacity of the mill. Have men on repairs in all parts of the mine where needed, and a portion of our force are engaged in retimbering the shaft. During the week have hoisted 252 cars of ore, and have shipped to the Nevada mill 465 tons and have milled 625 tons. Average assays, $29.44.

SAVAGE.—From Nos. 1 and 2 west crosscuts are stoping fair-grade ore, and also extracting ore from the old stopes in the north and south drifts. On the 500 prospecting drift from the upraise was extended 18 feet; face in quartz showing spots of good ore. Are extracting ore from the old stopes in the south drift. Extended crosscut No. 2, which is now advanced 2955 feet. During the week have hoisted 451 cars of ore and shipped to the Rock Point mil 502 tons and milled 490 tons; average battery assay, $20.07.

BELCHER. — The 1200 level, south drift, is in quartz, giving fair assays. The joint raise with Seg. Belcher from the 1100 is nearly connected. Will start an upraise from the 1200 as soon as the south drift on that level gets under the 1100 level winze.

SILVER HILL.—Northeast drift, 260 level, has been advanced 15 feet; distance from shaft 345 feet; face in quartz and porphyry. Raise in southeast drift, 160 level, is up 80 feet; distance from shaft, 670 feet; formation, gypsum and quartz.

CONFIDENCE.—The Joint Confidence, Challenge, and Imperial north drift on the 500 level has attained a length of 757 feet from the Yellow Jacket shaft, 29 feet having been added during the week. The face is in quartz, giving low assays.

OVERMAN.—Have run the mine six days. Extracted 248 tons of ore, and shipped to the Vivian mill 248 tons. At the top of the upraise from the east drift have extended the south drift 25 feet; total length, 84 feet.

CON. IMPERIAL.—The north drift on the 300 level is now in a distance of 215 feet from the south line of the mine, having been advanced 37 feet during the week. The face shows porphyry.

SCORPION.—On the 520 level the new east drift from the Sierra Nevada shaft is advanced 628 feet. No change in the character of the ground since last report.

CROWN POINT.—The 500 raise is up 92 feet, and the ground is becoming somewhat softer as they advance. Shipped to the mill during the week 829 tons.

POTOSI.—South lateral drift on 750 level is out 22 feet; face in quartz and clay. South lateral drift, 850 level, is out 480 feet; face in hard porphyry.

YELLOW JACKET.—Will resume the shipment of about 100 tons of gold ore daily to the Brunswick mill, which will hereafter run by steam.

NEW YORK.—North lateral drift from the northeast crosscut, 800 level, is out 100 feet. This drift is following the east side of the ledge.

SEG. BELCHER.—The 100 raise is up 132 feet. The top of the raise shows a streak of quartz two feet wide, which gives fair assays.

CHOLLAR.—East crosscut, No. 3550 level, 150 feet south of the north line, is out 17 feet; face in quartz showing bunches of ore.

BALTIMORE.—Continue to extract ore of good grade from the crosscuts on the 225 and 338 levels.

JUSTICE.—The north winze is down 67 feet and the bottom shows four feet in width of good ore. The shaft is down 101 feet, and the bottom is in

very hard rock. Shipped to the mill during the week 223 tons of ore, the average battery samples of which was $36 a ton.

ALTA.—Are running the mill steadily, and the mine is yielding the usual quantity of ore.

Eureka District.

RICH GOLD ORE.—Eureka *Sentinel*, July 6: Johnny McNaughton has placed on our table a specimen of ore from the gold belt of Prospect mountain, which is almost the pure quill itself. It is flecked with gold visible to the naked eye. There is a large section of Prospect mountain in which gold largely predominates the ores. The Silver, Connor, Williams, Matamoras and others are situated in this belt on the west side. Over the crest on the eastern slope, just opposite, the San Jose has yielded ore going as high as $246 to the ton in gold. The rich samples of gold ore constantly being found in the region under notice are of the greatest importance. They mean something with greater explorations. The truth is that the depth and strength and strike and inclination of the ore channels of the grand old mountain are not yet understood. When they are there will be no trouble to develop rich and large paying mines in that quarter of our district.

THE DIAMOND MINE.—An excellent improvement was shown in the Diamond mine by a little work in the ore body last week. The tunnel has been completed and an upraise started for the ore. Negotiations looking to the sale of the property seem to be progressing satisfactorily.

Tybo District.

DIMICK.—Belmont *Courier*, July 6: The Dimick mine at Tybo is yielding its usual quantity of good ore.

Morey District.

LOOKING BETTER. — Belmont *Courier*, July 6: Henry Metz informs us that the mine at Morey is looking better and better as work of development advances. The ore encountered is of a high grade, and the lessees are extracting large quantities of it. The company's mill will remain closed until Supt. Cohen procures a first-class millman to run it. Morey is a lively camp this summer.

Ophir Canyon District.

A BIG WATER-WHEEL.—Reese River *Reveille*, July 8: Jake Gooding tells us that he and his partners, a crew of four, are developing right along their gold mine at Ophir canyon, and that by the time there is sufficient water to turn the over-shot wheel they will have on the dump a number of tons. Snow & Co. of Reno are building a 40-foot overshot water-wheel by contract, which will be sent to them some time in the fall in separate parts. During the winter the men will stope out ore on the ledge to have plenty on hand for the run in the spring, as they expect to crush about ten tons daily when they get started. There is no water running in the canyon at the mine—the first time it was ever known to dry up since there has been a camp there.

Pittsburg District.

MILL SHUT DOWN.—*Silver State*, July 6: The Pittsburg Co.'s mill in Lander county is shut down because of the scarcity or water. The mill belongs to the English company which is mining extensively in Pittsburg district.

Tuscarora District.

BELLE ISLE.—*Times-Review*, July 7: West crosscut, from the end of the north drift, 250-foot level, has been extended 10 feet.

NEVADA QUEEN.—Winze from 450-foot level has been sunk 8 feet; total, 54 feet, bottom being all in vein formation, 18 inches being good ore, average assay $212 per ton. Crosscut on 350-foot level advanced 10 feet; face somewhat softer and some water. South drift from 150-foot level of Commonwealth advanced 8 feet in low-grade ore, with some seams of high-grade ore mixed in the face.

COMMONWEALTH.—Stopes throughout the mine are looking as well as at any time heretofore. Two hundred and thirty tons have been sent to the mill; average battery assay, $119 per ton. Bullion shipped, $16,018.92; crude bullion on hand, $8000. Mill was shut down yesterday—the 4th. Will start up again this evening, after making some slight repairs.

NORTH BELLE ISLE.—Crosscut west from the 300-foot level station has been extended 15 feet; total length, 85 feet, encountering seams that yield fair assays. On the 500-foot level some timbering has been done the past week, and progress has been slow. Have started to crosscut to the vein, 40 feet south of the north line.

DEL MONTE.—North drift on the 100-foot level extended 5 feet. East crosscut, same level, advanced 14 feet. No material change in the workings the past week.

NORTH COMMONWEALTH.—East crosscut, from the end of south drift, 100-foot level, has been extended 12 feet through vein matter carrying some high-grade ore.

NAVAJO.—South drift on west vein, 350-foot level, has been extended 11 feet, showing faces of ore. Upraise on east vein is up 30 feet, and shows some good ore.

GRAND PRIZE.—The stopes continue to yield about the same grade and quantity of ore.

ARIZONA.

UNITED VERDE.—Prescott *Courier*, July 4: United Verde mines are producing rich carbonate ores. Supt. Giroux, miners tell us, is doing better than most any of his predecessors. The ores are rich in gold and silver, hence the output is not affected by price of copper. Smelters are running free and Mr. Witherell, the freighter, is doing his part, furnishing coke and hauling out matte and bullion. There are in the district outside mines that will shortly be worked and made pay.

VULTURE.—Wm. A. Farish, a trusted mining lieutenant of Senator Tabor, owner of the Vulture, will immediately put men at work sinking from the bottom of the 400-foot incline, in good ore. As water exists at this depth, Mr. Farish has reason to hope that a sufficient supply to run the large mill and concentrators will ere long be found in the mine. Col. H. A. Bigelow, a mining man of large experience, holds a position at the mine.

ITEMS.—Fred Sattes has leased his mine in Crook canyon. Weckler & Snapp are going to increase shipment of ore from White Spar mine. Messrs. Riggs, Lawler, Howell and others say the Hillside is richer than ever. Frank Alters saw some fine ledges east of the Agua Fria. W. W. Davis brought some fine specimens of ore from the Poverty mine, consisting of iron and copper pyrites, assaying $75. He also took 6700 pounds of ore to the sampling works for shipment to Pueblo. The opening of the Poverty mine is astonishingly rich in its showing. The tunnel reaches over 100 feet in depth, and the raise to the face is 65 feet and exhibits a pay-streak of ore from one to three feet through.

CONGRESS.—The mine is producing about 180 tons of gold ore per month. The richest sulphurets are sent to the smelters; others piled up to be milled and concentrated. Looks as if the Congress is the boss gold mine of the world. It has paid expenses of opening, procuring mill, erecting, etc., has thousands of tons of ore in reserve, and, it is said, paid several dividends.

MIDDLETON.—Upwards of 20 tons of ore from Robeson & Foster's Middleton mine are undergoing sampling. Ore carries sufficient quantities of gold and silver to pay well for mining, hauling to Prescott in wagons, sampling, shipping to Colorado, treating, and enough left to keep the owners from suffering for want of anything.

WAR EAGLE.—John McKinnon and D. W. Strahan, owners of the Gladiator mine on the War Eagle lode, have eight feet of ore that assays from $40 to $60 per ton, gold. Mine is opened to a depth of 110 feet by shaft. There is a tunnel 120 feet in length.

DIXIE.—The Dixie mill, Walker district, is running and, we hear, making money for its runners. Attached to it are some concentrators. Ben Rybon, who came in from there a day or two ago, said the plates were well plastered with gold.

BIG BUG.—Very good ore is being hoisted out of the Boggs and Hackberry mines, Big Bug district. Frederick E. Murray is giving the work close attention, and appears to be pleased with both mines.

BRITISH COLUMBIA.

PROSPECTS.—Kamloops *Sentinel*, July 3: The mining prospects at Okanagan lake are reported to be good. Development work is being pushed forward rapidly, and every one interested anticipates good returns. On Siwash creek, on the north side of the lake, John McLellan & Co. have struck rich placer diggings. Three or four men in a few hours took out over $30. A rush has taken place, and on Monday last 25 or 30 claims were recorded.

COLORADO.

THE GOLD STRIKE AT EMPIRE.—Georgetown *Courier*, July 4: Less than one week after the Colorado Springs Co. commenced operations on the Hidden Treasure group on Lincoln Mt., Empire, they struck rich ore. Apparently a continuation of the same body supposed to have been worked out by Markey in '87. They have from a quarter to three-quarters of an inch of almost pure gold worth from $10 to $16 per ounce. The find is about 150 feet deep from surface and was struck in the shaft now being sunk 300 feet from the mouth of the tunnel level. Pauline Placer Co. last week began closing the head-gates of their reservoirs on Mill creek. Cause, short water supply this season. The Denver City, east extension of Lamartine, was last week deeded from W. S. Comer to Hanchett & Burns, the final payment having been made. The old Knickerbocker mill at Empire is running 12 stamps on ore from the Silver Mountain mine at North Empire. Horstmann M. Co. are employing a number of men on their Daily district mines. Assays of ore from one of their lodes made last week gave over 800 ounces silver. Lamartine shipped 100 tons of ore produced between June 18th and 30th. During the month of June 2650 sacks of ore were shipped—the largest by several hundreds of any previous month. The prospects are favorable for a very large shipment in July. The average output of the Stevens mine is 100 tons of ore per month, and the average net returns for the ore is about $45 per ton. Thirty men are employed, but when the raise is completed between the tunnel and the upper workings, which will take two or three months, the force of men and the output will probably be doubled.

DAKOTA.

BEAR GULCH TIN.—Deadwood *Pioneer*, July 3: Superintendent Jackson, of the Callanan group of tin claims at Bear Gulch, was interviewed by a *Pioneer* reporter. Working 12 men at present; developments are being pushed rapidly enough. A new shaft was started on the Pullman lode last week. This is now 20 feet deep and in ore from two feet below the surface to the bottom. The ledge is widening rapidly, and while not over 30 inches wide when first found, now shows all the six feet. On the Spearfish lode, a force is employed driving the open cut, 40 feet wide and now 100 feet deep. In this a 24-foot face of ore is shown. The Spearfish is about 300 feet lower than the Pullman.

KEYSTONE CHLORINATION WORKS.—Deadwood *Pioneer*, July 6: W. B. McPherson, of Keith's Chlorination works, in from Garden City last night, stated that the cleanup proposed for day before yesterday will be made to-day. The Harmony company yesterday leased the plant for 100 days, a time long enough to treat 1000 tons of ore, agreeing to pay a royalty of two dollars per ton for all ore treated. The chlorination company guarantees to save 80 per cent. Prof. Carpenter and others qualified to speak state that at least 95 per cent can be saved.

IDAHO.

THE GOLD HILL MINE.—*Statesman*, July 3: Thomas Mootry, one of the proprietors of the Gold Hill mine at Quartzburg, yesterday furnished some interesting facts regarding the present condition of the mine. The depth attained on that portion of the property now being worked, and which is known as the Pioneer lode, is 250 feet. Above this level there is 50 feet feet of stoping-ground in good ore, which is now being taken out and crushed at the rate of 40 tons per day. The company is working a force of 25 men in the mine and mill. Attached to the mill is a self-feeder which saves the labor of four men. Monthly disbursements at the mine for all expenses amount to $65,000 per month. Mr. Mootry, who knows the country thoroughly, having been engaged in quartz mining here during the past 25 years, is fully convinced that the range of mountains in which the Gold Hill mine is situated, contains numerous other lodes and veins, which could be developed into paying mines, equally as valuable as the Gold Hill.

GOING FOR DEPTH.—Wood River *Times*, July 3: One possibly great benefit is, it seems, to inure to us from the recent visit of Craig Chambers. After looking through the Idahoan, Mr. Chambers concluded to "go for depth," and therefore gave instructions to sink another 100 feet. The present depth of the mine being only 700 feet on the dip of the vein, this will give it a depth of 800 feet on the vein, or of somewhere between 400 and 600 feet, vertical; and it will open up quite a stretch of entirely new ground. If an ore body is found, it will be the making of this region.

WORK RESUMED ON THE TIP TOP.—Work was resumed this morning at the Tip Top mine by a force of five or six men. Ole Rorem is the superintendent. About 25 tons of ore will be extracted for a test run at the Deer creek mill, and if the result is satisfactory, or even only partly so, the force at work in the mine will be increased, and ore extracted in large quantities. The Tip Top, as every one here knows, is on the Gold Belt, not a great distance from the Camas No. 2.

LOWER CALIFORNIA.

THE ALAMO MINES.—San Diego *Union*, July 4: The International Co. has prospected 25 locations at Alamo, by sinking shafts, running drifts and opening cuts on each one from 20 to 50 feet, and at least can be called first-class prospects. Many would call them mines without further development, as the ore now on the dumps will testify to their value. There are at least 25 good paying properties in the camp; the veins running from one foot to ten feet in width, and every one, without exception, that showed good prospects on the surface has improved with depth and development. Among the most prominent mines might be mentioned the Scorpion, owned by McGrath & Antonia; the Texas and El Paso, owned by Owens & Bain; the Elsinore, owned by Elsinore parties; the Rainbow, owned by Frey, Jackson et al.; the Asbestos and others, owned by Huff, Agramonte et al.; the Telemico, Princessa, Ulysses, Cocinero, Spider, San David and others, owned by the International Co.; also the Aurora and Alamo, owned by Pedro, Lopez & Gonzales; the Tarantula, owned by McCarthy and the Torres Mining Co., with the different mines owned by Mr. Butler, and many others, too numerous to mention. There are several first-class prospects owned by Lucas & Blethen. The Elsinore is 48 feet deep and has 10 feet of solid pay ore; the Scorpion has from 2 to 7 feet; the Telemico from 3 to 6 feet; the Ulysses from 2 to 5 feet, and the Princessa from 2 to 4 feet. The Elsinore and Telemico are conceded to be the best in camp. When it can be said that every one of these mines will produce in paying quantities gold ore that will run from $20 to $100 per ton, some idea will be given to the mining public of the great value and importance of this new district. There are now in operation Butler's mill of five stamps, and the Torres mill of five stamps, with power for 15, the balance now on the way. The International Co. will soon have a plant of 20 tons daily capacity, with four concentrators; also two steam hoisting and pumping plants, and the company's agent is now on the road to San Francisco to purchase and ship them at once. The International Co. will also put in a sawmill to furnish mining timbers for all the mines. The townsite of Alamo is finely located, with water works nearly completed. Mr. Douglas runs a tri-weekly stage line from Ensenada, making the trip in 12 hours. F. T. Sutherland is superintendent of the International Co.'s mines, and will purchase all the mining machinery to be used by them. James Randall is superintendent at Ensenada, and will purchase for and manage the sawmills. Both of these gentlemen are in this city, and are en route for San Francisco, where they go in the interest of the International Co. The company is causing roads to be built to the mines, and are doing everything in their power to further the interests of the country. Owens & Bain of El Paso, Texas, will put up a mill in the near future.

MONTANA.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, July 4: The output for the week ending July 4th was 54 bars of bullion, containing 85,419 ounces silver and 159 49 ounces gold. Last Wednesday the Granite Mountain M. Co. declared their regular monthly dividend of 50 cents a share and also an extra dividend of 25 cents, both of which are payable July 10th. This is virtually a dividend of $300,000 or 75 cents a share, and brings the total amount paid by this company to date up to $6,700,000 and $1,300,000 since January 1st last. This is a specimen of what the greatest silver mine in the world can do, and what's more, the great Granite can and will keep it up for years to come. If there is a mine in the world that can beat this showing, we would like to hear of it. They have but fairly got to work with their new milling plant at Rumsey, and when things get running down to a fine point (which Supt. Weir says is the case at present), the dividends will exceed the above, or at any rate keep up a regular 75-cent dividend, or $300,000 per month. This means a dividend of $3,600,000 a year, which on 400,000 shares gives an annual dividend of $9 per share. Truly, Montana has the champion silver mine of the world. The Granite Co. are in receipt of a new pump which has a working capacity of 1000 gallons per minute, and which will be placed on the 800-foot level.

ORO FINO DISTRICT.—A recent arrival from this district informs us that the work on all the mines is progressing most satisfactorily. On the Ruby and American claims a vast amount of surface work has been done, and at present they are timbering the shaft, and a contract has been let for sinking 50 feet further, when they expect to strike the vein. The shaft will be sunk about 200 feet before they crosscut. Timbers are being framed for the gallows-frame, and machinery will be on hand for the hoist as soon as needed. At the Mountain Lion, operations are going ahead with the usual good results. They have now attained a depth in the shaft of 200 feet, and are crosscutting to the vein. They are sinking in country rock. At a distance of about 700 feet in the tunnel on the Mountain Rat, all the men were obliged to discontinue work on account of bad air, and further operations will cease until an air-compressor is put to work, and this will be done as soon as possible. At the Champion, the ore body in the mine is increasing in width all the time as the work proceeds. Shipments are being made right along. The company still has $20,000 in the treasury to be used in the developing work.

NEW MEXICO.

HACHITA.—*Western Liberal*, July 5: W. K. Smith from Hachita reports that the camp is taking on a boom which bids fair to equal the San Pedro and Cerrillos camps in Santa Fe county. There are 27 men at work on the American mine—all there is room for. An air shaft is being put down, and as soon as connections are made, a number of more men will be put on. The more work that is done on this property, the more ore there is exposed. The vein as exposed varies from four to eight feet, and it is all shipped without sorting to the International smelter at El Paso. The Dugout, owned by Smith, has three men at work on it taking out galena which runs from 60 to 80 per cent lead and carries from 500 to 1100 ounces in silver. Bob Anderson has one of the best claims in camp, but has been obliged to stop work and put in a pump, as he could not handle the water with a whip.

GOLD. — Silver City *Enterprise*, July 6: J. R. Johnson was in from Fleming this week, displaying some gold specimens which for richness can hardly be surpassed by anything from the Pinos Altos district. One of the specimens came from the depth of 300 feet, and was literally full of free gold. The other specimen came from nearer the surface, the gold being of a coarser character. It would be strange if the Old Man turned into a gold mine, after producing marvelously rich silver ores in quantities. The Standard Company of Shakespeare, has contracted to deliver 20,000 tons of ore to the Humboldt Company, which will soon have its new mill in operation. The rolls have given place to the stamps. The rolls from which wonders were expected, wore out after crushing eight tons of ore, thus causing a long delay in operations.

OREGON.

BONANZA MILL. — Bedrock *Democrat*, July 3: Mr. James R. Ladd of the Bonanza mill is in the city and from him we learn that the outlook in his section is very flattering. He brought in 70 ounces of dust, the output of four days of the Bonanza on Haggard ore. This mine looks very promising. They have 300 tons of ore in sight which will mill $50 per ton. They have one foot of ore in the face of their drift giving a pan test of $300 per ton. He reports several discoveries in the Greenhorn mountains which look very flattering, the ledges being very large, and assays from 20 to 60 ounces in silver with a large percentage of gold. One peculiarity of this country, is the silver-bearing rock carrying so largely in gold.

UTAH.

PARK NOTES.—*Record*, July 6: Last Saturday evening Ezra Thompson, Wm. O'Connell, Dan MacDonald and F. H. White, after repeated efforts, obtained a lease for one year on the Nevada and Northland mining claims, owned by C. E. Street, Jos. Gorlinski, F. J. Lubeck, Peter Anderson and Andrew Lundin. This property adjoins the Woodside group and the Mayflower No. 7, and it is considered a property of great value because the fertile vein which lie in the adjacent ground undoubtedly runs through these two claims also. The leasers immediately put a force of men at work.

THE APEX JIGGERS.—Flindt & Varcoe, who are working the Apex dump under a lease, are making good headway with their jigs. As soon as they get a rock breaker, however, more effective work can be done. Their machinery is ample and ere long the dump will have been worked over. Already they have shipped about 30 tons of high-grade jiggings.

CONCERNING THE CRESCENT.—The Crescent's hoisting machinery is being thoroughly overhauled and the pumps put in working order, in consequence of which comparatively little ore is being taken out at present and the tramway is temporarily shut down. The concentrator is working only during the day now.

THE ALLIANCE PRODUCING.—A considerable number of miners have been at work at the Alliance mine—the old Sampson—for several weeks past and the result is that the ore bodies have been opened up sufficiently to justify the resumption of ore shipments. This morning shipping began.

ORE SHIPMENTS.—During the week the Crescent shipped 60,000 pounds of concentrates. For the week just ended the Mackintosh sampler received 440,840 pounds of Ontario ore; 272,830 of Daly; 109,870 of Woodside; and 36,120 of Mayflower No. 7 leasers' ore; total, 859,660 pounds.

THE starting up of the new Union concentrator is still delayed because of the non-arrival of piping to complete water connections. However, the delay is not expected to last through the coming week. Everything else about the concentrator is in readiness.

ABOUT THE WOODSIDE.—The usual force of men employed by the leasers is kept at work by the Woodside Mining Co. and the average shipments are made.

WASHINGTON TERRITORY.

CLE-ELUM.—Ellensburgh *Capital*, July 6: A good deal of assessment work is being done on the mines of the Upper Cle-Elum. The new road to Fish lake will be completed this season and will be of great advantage in getting to and from the mines of the Upper Cle-Elum. The new silver lead struck at Salmon La Sac is attracting attention. Some development work is being done. The Uncle Sam and Brother Jonathan mines in Iron Mountain district are looking well. They are among the largest iron deposits on the Pacific Coast. Prospectors are doing well all along the Upper Cle-Elum this season. They find the mountains free from snow, and they can get around with but little interruption. The coal mine at Easton is opening up in good shape and will be a producer this season.

MECHANICAL PROGRESS.

Melting Iron.

W. A. Jones, a correspondent of the *Practical Mechanic*, furnishes that paper with the following practical information on melting iron:

The true principle of economy in melting iron is to handle the cupola in such a manner as to get as near as possible the full benefit of the fuel consumed, and at the same time use no more than is sufficient to melt the iron bright and hot. The average foundryman knows very little of chemistry, and cares very little for theory. His calculations are based upon an actual experience, the result of years of observation.

He knows that under certain conditions he may look for and expect certain results, and upon these conditions there is so much dependent over which he has no control, that it is not surprising that there is not more rapid strides made in this direction. To more clearly illustrate this, we may state that one of our largest manufacturers of steel recently remarked that it was practically impossible to produce twice in succession the same grade of steel, and this, too, from the same materials, by the same workmen, and apparently under the same circumstances.

This is just as applicable to cast iron as it is to steel, with only this difference: that cast iron is not as finely-graded, is not subjected to the same degree of manipulation in the way of tempering, annealing, etc. In other words, it does not receive the attention, probably for the reason that it is not as essential that it should. There is little doubt but what, if the same care and attention were exercised, the same difficulties in its production would arise.

It does not take a chemist nor a philosopher to see at a glance that the chemical changes brought about in the fusing of either iron or steel are largely dependent on the conditions of the elements, and these, to a much greater extent than is generally supposed, affect the draft and the fuel, and thereby the product produced.

Melting iron does not consist of merely reducing the greatest number of pounds into liquid shape, with the smallest percentage of fuel, but in actually melting it—melting it hot enough so that the various brands used will be thoroughly mixed together, something that is impossible unless the iron is melted hot. Many an otherwise good casting has been condemned from the "Penny-wise and pound foolish" principle of economy in cutting down the fuel too close, resulting in the iron not being mixed as it should be, at times forming the hard streaks or spots found in pulley rims, and other light castings requiring a finish.

The loss of very few castings from failure to run, or what is just about as bad, being *cold short*, would more than pay the cost of enough additional fuel to change the whole heat, to say nothing of the condition of the cupola and ladles in the morning.

When iron is not properly melted, it is impossible to produce good, sound, clean castings, no matter how much care is exercised in the construction of the mold or in pouring it.

Some time since a well-known writer on foundry practice made the statement in connection with clean castings, "that melted iron was pure," thus inferring that if the casting was not clean, the impurities came either from the mold or the ladle. This is a mistake, one, too, that is liable is mislead, as in fact it did mislead the writer. Melted iron contains many impurities, and the hotter it comes from the cupola the more readily these impurities can be separated and removed. The hotter the iron is in the ladle, the greater the agitation will be, and the more it is agitated, the more the impurities are thrown off. If melted iron was pure, there would be no occasion to use flux of any kind in the ladle. Graphite or black lead is found in many of our best brands of soft iron, but usually not in sufficient quantities to do any material damage when the iron is melted hot, but its presence is always more apparent in dull iron, and is, therefore, more noticeable in the first and last of the heat.

The art of mixing and melting iron is one to which there is practically no limit, and is well worth the consideration of progressive foundrymen.

There never was a time in the history of iron interests in which so many experiments have been put forth as at the present time, and it is conceded by many that we are on the eve of a complete revolution, in which the foundry will play no unimportant part. The development of steel and wrought-iron castings, the introduction of the Robert process, which bids fair to make it possible to produce any quality of steel or iron from the same converter, and at a very material decrease in cost, must eventually supersede the famous Bessemer process, while the introduction of aluminium in cast iron is still in its infancy.

ABRAHAM LINCOLN AND THE BLACKSMITHS.—More than one able man has started in life as a blacksmith, and many more able men have in their boyhood days been ambitious to put on the leather apron and learn the blacksmith's art. It is stated that Abraham Lincoln when he was a boy made up his mind at one time to learn the blacksmithing trade. Exactly why he did not carry out his intention we are not informed. His worth attracted attention afterward and he was nominated for the Legislature of Illinois. His maiden speech is worth preserving on account of its unpretentious character. It is as follows: "Gentlemen and fellow-citizens: I presume you all know who I am. I am humble Abraham Lincoln. I have been solicited by many friends to become a candidate for the Legislature. My politics are short and sweet. I am in favor of a national bank; I am in favor of the internal improvement system and a high protective tariff. These are my sentiments and political principles. If elected, I shall be thankful; if not, it will be all the same."

Steel as a Boiler Material.

The interesting topic of steel as a boiler material was discussed recently at a meeting of the South Staffordshire (English) Institute of Iron and Steel Managers, in the course of a debate on a paper read by Mr. G. H. Walkeden entitled "Notes on the Lancashire Boiler." Several instances were, by various speakers, adduced, wherein steel had proved by no means so satisfactory a material as had been anticipated.

"No steel in my boilers" had been the stipulation of one steam-user when paying £400 for a boiler 30 feet by 8 feet, so he had his boiler constructed completely of iron. Another example was given where another boiler user had had some of his boilers bottomed with steel plates, but in three months' time the steel plates had to be taken out and replaced by iron. Various explanations were offered of these occurrences by the champions of steel, who were by no means few. Bad feed-water was adduced as one probable cause of the preference shown by some steam-users in the Midland district for iron over steel, bearing in mind the higher susceptibility to corrosion shown by the latter metal and the notoriously bad quality of the water in the canals of Staffordshire and Warwickshire.

Corrosion due to electrolytic action was another suggestion which received favor from the meeting, and which perhaps boiler-makers and boiler-users do not generally at present take into account as much as they well might do. W. A. E. Tucker, metallurgist, of Smethwick, near Birmingham, said he knew of cases in that district in which boiler explosions had been clearly attributable to electrolytic action, set up by the combination of iron and steel in the construction of the boiler, and by the presence of brass fitting. This action had been sometimes set up by the use of tie rods of manganese bronze and phosphor bronze and similar materials. The intention had been to prevent corrosion, but the effect was just the reverse, for the electrolytic action was very marked at both ends of the tie rods, as the steel plates were correspondingly corroded at those particular points. While the subject is of course by no means a new one, it is of additional importance at a time like the present when the qualities of iron and steel for constructive purposes, both separately and in conjunction, were never more eagerly canvassed.

THE SMOKE NUISANCE.—We hear a great deal said about the "smoke nuisance," and various devices have been presented in the way of "smoke consumers" and other inventions for overcoming the evil; but most of these devices have proved miserable failures. The trouble has been that the inventors and other people interested in this subject have gone to work in the wrong way—have followed out wrong theories, and have subjected themselves to a great expense in order to get rid of the smoke after it was generated. This problem will probably remain unsolved until this theory is abandonded and the public have become thoroughly educated in another direction, and that is, to prevent the generation of smoke in the furnace, which, it has been thoroughly demonstrated, is the surest, if not the only way of entirely abolishing the "smoke nuisance."

ECONOMY OF FUEL GAS.—The opposition to the use of fuel gas for manufacturing purposes does not appear to be founded upon a fair business basis of merits, but seemingly originates in a fear of healthful competition and its success over other combustibles used with the same object. On this subject we have the most conclusive testimony from high authority, where it has been employed, and when the most complete details have been kept that the average saving over the use of coal is more than 30 per cent. The executive head of the Philadelphia Saw Works, Mr. Hamilton Disston, states that in the process of annealing, alone, the advantage gained from the introduction of the gas has rendered the latter invaluable. In the business circles of the world the word of Hamilton Disston is good.

COPPERING IRON.—Iron can be coppered by dipping it into melted copper, the surface of which is protected by a melted layer of cryolite and phosphoric acid, the articles to be thus treated being heated to the same temperature as the melted copper. Another process consists in dipping the article into a melted mixture of one part of chloride or fluoride of copper, five or six parts of cryelite and a little chloride of barium. If the article, when immersed, is connected with the negative pole of a battery, the process is hastened.

A STEEL suspension bridge is now being put up at Azusa, Los Angeles county. It crosses the San Gabriel river, and has a span of 200 feet.

SCIENTIFIC PROGRESS.

What Shall We Call It?

There is need of a new word or phrase that shall be distinctly expressive of modern progress. The expression, "this age of steam and electricity," has become stale and hackneyed. For all practical purposes of description it is at least half a century behind the times and should be retired with the phrase it superseded, "the age of canals and stage coaches." The flying carpet and magic mirror of the Arabian tales were realized, Dr. Holmes says, in the modern railroad coach and photographic camera; but the wonderful advances since these inventions find no prototypes in even oriental imagination and almost distance the wild dreams of theosophy. Here, for instance, is Mr. Edison, the magician of Menlo Park, working on a "far-sight machine," by means of which, he predicts, "one person can distinguish the face of a friend 500 miles distant." Next comes a learned scientist from the university of Pennsylvania, like another Dr. Faust from his diabolical laboratory, with mechanical contrivances which, it is claimed, "measure the time in hundreths of a second which is required to see the different colors, and they let you know exactly how long it takes you to smell a rose that is just under your nose, to taste a beefsteak that is in your mouth, to feel a thing that is under your hand, or hear a street band that has begun to play."

And stranger still, an Italian, who seems to combine the qualities of a mechanician, metaphysician and magician all in one, has constructed a machine which "registers in pounds and ounces the amount of brain-power expended in mental effort, and tells you just how much a dream weighs or how many pounds of brain cells you consumed in reading a book, or writing a poem, or listening to a sermon." These are clearly in the line of patent senses that shall do for the nose, taste, sensation, and even the natural functions of the intellect what the telescope does for the eye and the telephone for the ear. Will the coming man smell with a Lick nosescope and think with a Zalinski dynamite thinker, or something of that sort? To call the era which gives us these wonders of mechanical invention, this artificial expansion of pia mater and production of brain-power by machinery "the age of steam and electricity" is absurd.—*Cincinnati Times Star.*

DISCOVERING SPRINGS.—For ages many absurd fables were believed with respect to the best method of discovering springs, and even now the divining rod has not lost its partisans. There are, however, indications which may lead to the discovery of springs in cases where nothing would appear to those unaccustomed to observations of natural phenomena to induce a belief in their existence. The following are some of the more simple. In the early part of the year, if the grass assumes a brighter color in one particular part of a field than in the remainder, or, when the latter is plowed, if a part be darker than the rest, it may be suspected that water lies beneath it. In summer, the gnats hover in a column, and remain always at a certain hight above the ground over the spot where springs are concealed. In all seasons of the year denser vapors arise from those portions of the ground which, owing to the existence of subterranean springs, are more damp, especially in the morning or the evening. The springs to which these rules apply are such as are near the surface; when the source is lower the only safe guide is a bore, but to work this with success a certain knowledge of elementary geology is absolutely necessary.

ELECTRICITY AND LIGHT.—Dr. Moser (Eder's Jahrbuch fur Photographie) draws attention to the following curious phenomena: The leaves of an electroscope are caused to diverge by charging with, say, 150 cells. On allowing a ray of direct sunlight to fall on the instrument the divergence is increased, and it returns to its original amount when the light is cut off. A common match (sulphur with phosphorus tip) will glow in the dark when brought close to a charged body, such as the cover of an electrophorus. The mercury in a capillary electrometer falls when a ray of sunshine falls on it, just as it does when connected to the zinc of a battery. The effect is distinctly electrical, not thermal, as it vanishes when the upper and lower mercury columns are short circuited by a wire.

SOME RECENT BIOLOGICAL DISCOVERIES.—A most interesting lecture on this subject was delivered on May 21st before the British Royal Institution, by Prof. E. R. Lankester, in which he described at some length the studies made on the white corpuscles of the blood, their function, and the way in which it has been found possible to "educate" them in their fight with certain forms of disease. Twenty years ago very little was known about the white corpuscles beyond the fact that they were always found present in blood. Physiologists supposed they must have some function, but they were quite at a loss to guess even what it was. It was gradually recognized that there was a close resemblance, even to their movements, between them and the well known fresh-water amœba, so that they came to be called amœbiform bodies. It was the work of the Russian physiologist, Elias Metschnikow, that showed they were really the scavengers of the blood, that they eat up what is not wanted (whence he called them phagocytes) and by their motion in the blood often transfer it to where it is wanted. In all parts of the animal kingdom he had examined, he found their function the same. It is by their action the tadpole loses its tail, and it is by their rush to "eat up" the damaged part of cell structure that there is a formation of white pus. Metschnikow wished to know how they behaved with regard to the bacilli of diseases. He, therefore, took the transparent fresh-water daphnea pulex and introduced bacilli. With the aid of the microscope he found it was the case of a fight whether the phagocytes could eat up the bacilli fast enough, or whether they would attack the mat all. Phagocytes act as if they had real conscious likes and dislikes. They strongly, for example, dislike sulphate of iron, and shrink from it. But if their only food be placed beyond a streak of it they will pass over it, and in time their objection seems lost. The lecturer expressed his strong belief that corpuscles can in many ways be "educated." Some bacilli seem too powerful for them, but if the bacilli are cultivated, and their powerful poison action is weakened by this process, the phagocytes can "tackle" the weaker forms, and by degrees get trained to be able to face the strong. It is here we get the explanation of the effects of innoculation with "attenuated virus."—*Ex.*

THE "DESERT" OF SAHARA.—The Sahara, as a whole, is not below sea level; it is not the dry bed of a recent ocean, and it is not as flat as the proverbial pancake all over. Part of it, indeed, is very mountainous, and all of it is more or less varied in level. The Upper Sahara consists of a rocky plateau, rising at times into considerable peaks; the Lower, to which it descends by a steep slope, is "a vast depression of clay and sand," but still for the most part standing high above sea level. No portion of the Upper Sahara is less than 1300 feet high. Most of the lower reaches from 200 to 300 feet. The two spots below sea level consist of the beds of ancient lakes, now much shrunk by evaporation, owing to the present rainless condition of the country; the soil around these is deep in gypsum, and the water itself is considerably salter than the sea. That, however, is always the case with fresh-water lakes in their last dotage, as American geologists have amply proved in the case of the great Salt lake of Utah. Moving sand undoubtedly covers a large space in both divisions of the desert, but according to Sir Lambert Playfair, our best modern authority on the subject, it occupies not more than one-third part of the entire Algerian Sahara. Elsewhere rock, clay and muddy lake are the prevailing features, interspersed with no infrequent date groves and villages, the product of artesian wells, or excavted spaces, or river oases. Even Sahara, in short, to give it its due, is not by any means so black as it's painted.—*Cornhill Magazine.*

THE MANUFACTURE OF CELLULOID is to be investigated by the French Government with a view to lessening the danger to property and life which attends the making of that inflammable material. During the past two years three celluloid factories in France have been burned, without counting the preparation works at St. Denis. Each of these fires was also attended by loss of life, and in a recent instance at Paris, where a celluloid button factory was destroyed, two persons were killed and three seriously injured. It is thought that the French authorities will probably prohibit the manufacture of celluloid within a certain and considerable distance of inhabited houses. There can be no question as to the propriety of such regulations. The process of making celluloid, which is composed in great part of gun cotton, is too dangerous to be permitted in settled neighborhoods, and such establishments should be isolated. The worst of it is that the proprietors of these works, despite the many warnings which they have had and the property and lives sacrificed by explosions and fires in their works, carelessly go on assuring the public that there is no danger. The terrible explosion about two years ago over in New Jersey settled that question pretty thoroughly in the minds of people in that part of the country.—*Ex.*

SKULL DEVELOPMENT.—By comparing modern skulls with those of the same race in an old monastery in the Kedron valley, Mr. Dight of the American college of Berut, Syria, has shown that 13 centuries have added two inches to the circumference and the 3½ cubic inches in the capacity of the Caucasian skull. The brain has developed in the parts presiding over the moral and intellectual functions growing higher and longer, without increase of the lower portions, which give breadth to the head, and in which the selfish propensities are centered.

SCIENTIFIC USE OF THE EIFFEL TOWER.—One of the scientific uses of the Eiffel tower will be to weigh the moon. The method by which this rather startling purpose is to be accomplished is explained, along with the other marvellous capacities of that mammoth aspiration of iron, by Camille Flammarion, president of the French Astronomical Society, in the July number of the *Cosmopolitan*, with a number of striking illustrations.

ATMOSPHERIC SATURATION.—The invention of a "fog machine," by which water is thrown in spray as fine as vapor, makes it possible to spin the finest cotton thread in mills established in the hottest, dryest parts of the South.

GOOD HEALTH.

The Natural Diet.

The food which is most enjoyed is the diet we call bread and fruit. In all my long medical career, extending over 40 years, I have rarely known an instance in which a child has not preferred fruit to animal food. I have many times been called upon to treat children for stomachic disorders, induced by pressing upon them animal to the exclusion of fruit diet, and have seen the best results occur from the practice of reverting to the use of fruit in the dietary.

I say it without the least prejudice, as a lesson learned from simple experience, that the most natural diet for the young, after the natural milk diet, is fruit and whole-meal bread, with milk and water for drink. The desire for this same mode of sustenance is often continued into after years, as if the resort to flesh were a forced and artificial feeding, which required long and persistent habit to establish its permanency as a part of the system of every day life.

How strongly this preference taste for fruit over animal food prevails is shown by the simple fact of the retention of these foods in the mouth. Fruit is retained to be tasted and relished. Animal food, to use a common phrase, is "bolted." There is a natural desire to retain the delicious fruit for full mastication; there is no such desire, except in the trained gourmand, for the retention of animal substance.

One further fact which I have observed—and that too often to discard it as a fact of great moment—is that when a person of mature years has, for a time, given up voluntarily the use of animal food in favor of vegetable, the sense of repugnance to animal food is soon so markedly developed that a return to it is overcome with the utmost difficulty. Neither is this a mere fancy or fad peculiar to sensitive men or oversentimental women. I have been surprised to see it manifested in men who were the very reverse of sentimental, and who were, in fact, quite ashamed to admit themselves guilty of any such weakness. I have heard those who, gone over from a mixed diet of animal and vegetable food to pure vegetable diet, speak of feeling low under the new system, and declare that they must needs give it up in consequence; but I have found even these (without exception) declare that they infinitely preferred the simpler, purer, and, as it seemed to them, more natural food, plucked from the prime source of food, untainted by its passage through another animal body.—*Longman's Magazine.*

THE WASHINGTON EAR.—There is a disease said to be caused by asphalt dust, which is somewhat graphically referred to by a Washington correspondent of the St. Louis *Globe* as follows: With the march of modern improvements and the growth of luxury, diseases and their names increase, and humanity suffers from a score of polyesyllabic ailments now that our grandfathers never heard of. The latest is the "Washington ear," and such a name is a provocation to all the jokers and scoffers who knew what extraordinary things the Washington ear does manage to gather in, and the Washington tongue thereafter spreads. A friend of mine was taken with a sudden and frightful pain in the ear after a long drive on a windy day in an open carriage. Mindful of Roscoe Conkling's sufferings and untimely end, she sent at once for the best aurist in the city, and, after the first look, he said: "Oh, it is nothing but the Washington ear. It is an inflammation caused by the dust from these asphalt pavements. The dust is very poisonous to the ear, and I have innumerable cases of it. One or two patients who have obstinately refused to wear cotton in their ears on windy and dusty days, have lost their ear-drums by following inflammations."

ABOUT COLOR BLINDNESS.—Mr. Hughes relates that while acting as assistant engineer on the Granton railway he frequently returned on one of the engines from Granton to Edinburgh. On these occasions he observed that, although his undivided attention was directed toward the signal lamps, the lights of which were visible to him a long way off, he could not, till he was close to them, tell whether they were red or green. These are the two colors most commonly confused, but happily, they are visible to the majority of color blind persons when strongly illuminated. Railway guards, therefore, are less liable to mistakes by night than by day. Inability to discern any colors at all is very rare, and, in fact, has never been satisfactorily proved. A color blind person may have as good a sight in other ways as anybody else. The defect is not occasioned by any disease in the eye, but seems to have its origin in the brain. A red-green blind person sees only two colors on the spectrum; all the colors on the side of the red (warm colors) are confused together, and all on the side of the violet (cold colors), but the warm and the cold are never confused. Yellow is the one color which is always distinguishable. It is a curious fact that color blindness is often associated with a corresponding inability to distinguish musical sounds.—*Medical Register.*

TO CURE CRAMP.—A physician says: When I have a patient who is subject to cramp, I always advise him to provide himself with a strong cord. A long garter will do if nothing else is handy. When the cramp comes on take the cord, wind it around the leg over the place that is cramped, and take an end in each hand and give it a sharp pull, one that will hurt a little. Instantly the cramp will cease, and the sufferer can go to bed assured it will not come on again that night.

TO INSURE HEALTH, so far as human effort can control the matter, one should above all be cheerful, contented, and calm. Be cheerful, do not brood over fond hopes unrealized until a chain, link after link, is fastened on each thought and wound around the heart. Nature intended you to be the fountain-spring of cheerfulness and social life, and not the traveling monument of despair and melancholy.

TUBERCULOSIS FROM EARRINGS.—Dr. Von Duhring has reported a case in which tuberculosis was transmitted by the earrings of a girl who died of consumption to another girl. Shortly after the second girl commenced to wear the earrings, an ulcer containing tubercle bacilli formed on her left ear and she subsequently developed pulmonary consumption.

TO PREVENT SEASICKNESS —Some one who who claims to have tried it, says that seasickness can be regulated by a system of breathing. One must sit still and time the breathing to the upward and downward motion of the boat. As the boat falls, there should be a full expiration, and as the boat rises, start on an inspiration, ending just as the boat begins to drop.

NARROW-CHESTED RECRUITS of the Prussian army are to be measured monthly, and those whose chests are not widened by drill are to be discharged as predisposed to consumption. All are to be considered narrow-chested whose chests are less in circumference than half the length of their bodies.

CALAMUS IN HICCOUGHING.—Sweet flag (calamus) is claimed by Dr. Haigh of Granda, Kan., to be an agent that will relieve and stop persistent hiccough in almost any case. He directs the patient to chew a small piece of the root. It has never failed in his hands.

USEFUL INFORMATION.

EVOLUTION OF NATURAL GAS.—The first recorded discovery of a natural gas-well in the United States resulted from borings made within the limits of the present city of Charleston, S. C., in 1815, but in this case the gas does not appear to have been put to any use. In 1821 natural gas was discovered issuing from a spring at Fredonia, N. Y. This discovery was made by a woman who had gone to the spring one dark night to draw some water in a pail. In order to aid her in doing this, she put down a lantern, when the gas which was rising from the spring, took fire. This alarmed the woman, who hastily dropping both pail and lantern, ran back to her home as fast as possible. This gas was first collected by excavating and covering the spring. It was then conveyed into a small holder made of copper, and from thence to one mill and several stores where it was used for light. This was the first practical use of natural gas in the United States. When Lafayette passed through the village in 1824 the hotel called the Taylor house was illumined with this gas in honor of this distinguished man. The well is said to be producing yet, and Fredonia is still lighted by natural gas.—*Engineering and Mining Journal.*

A CORRECT ANSWER.—A scientific paper recently offered a reward for the most correct answers to certain scientific problems. Among others was the old scientific "conundrum," which weighs the most, a pound of feathers or a pound of lead? Of course a pound is a pound, no matter of what substance, and when the simple or thoughtless person answers that a pound of lead is the heaviest, everybody laughs. Mr. Charles Plitt, in answering this question, claims that the lead would weigh the heaviest, because the feathers would be buoyed up by a weight equal to the amount of air which they displace—just as a cork is buoyed up in the water. In future, therefore, we must refrain from laughing at the fool's answer, as practically it is correct. Of course, if weighed in a vacuum, a pound of any two substances would weigh alike.

THE STICK OF WOOD IN THE BARREL.—A correspondent of the *Practical Mechanic* writes that he has tried the experiment which has been written about in the press of late, of inserting a stick of wood in a barrel or hogshead of water to prevent its bursting when frozen, and has found it an effective remedy. He says he had no faith in the success of the experiment, but decided to risk one barrel, so inserted a stick about 4x3 inches and let the barrel freeze up solid, and much to his surprise the barrel was uninjured, the ice bulging up around the stick, but not a stave or section of the head started. This is a valuable thing for all to remember.

KILLING A TRUST.—The pine-straw industry, backed by Southern capital, is the answer which will be made to the jute trust this year. The pine bagging patents are owned by five men, who purpose to have ready for the fall cotton crop five factories that will make 10,000,000 yards of bagging. It takes about 55,000,000 yards of bagging to cover 7,000,000 bales of cotton. That means 28 factories, which at present estimates would cost $5,600,000, or about 80 cents a bale, permanently invested in factories. The five factories they will undertake to build this season will put things in decidedly better shape than they were last year. The farmers are not out of the woods yet, but they can see the light breaking through the pine trees.—*Atlanta (Ga.) Dispatch.*

A NEW NON MAGNETIC ALLOY.—A new alloy has recently been brought out in Geneva, Switzerland, by Messrs. Ostermann and Lacroix, to be used as a substitute for steel in the manufacture of different parts of watch mechanism, such as, for example, hair springs and balance wheels, which are apt to cause a good deal of annoyance through becoming magnetized. We need, therefore, perhaps scarcely say the alloy is claimed to be non-magnetic. It is made up from 30 to 40 parts of gold, from 30 to 40 parts of palladium, .1 to 5 parts of rhodium, 10 to 20 parts of copper, .1 to 5 parts of manganese, and the same proportion of silver and of platinum. The copper and manganese are first mixed, after which the other metals are added, or all the metals may be put into a crucible at the same time, the manganese being used for the bottom layer.

DEPOSITS OF WAGE WORKERS.—The wage workers of the country possess a power of which they know but little at this time, which can come only by a slow, steady accumulation of surplus earnings. In all our larger cities throughout the North the wage workers are the heaviest depositors. It is their money, under the control of able men, that moves the wheels of trade and commerce. In Boston the deposits of the wage workers run into the millions. Throughout the manufacturing towns of New England and the Middle States there are tens of thousands and millions invested by the wage workers which bring them returns ranging from three to six per cent. Philadelphia has its banks filled with money from the pockets of its 300,000 wage workers, and Pittsburgh has $25,000,000 in its banks, placed there by the toilers in mills and factories.

EDISON STILL AT WORK.—"I am at work at present upon no less than seventy distinct inventions," said Mr. Edison. "One of the most peculiar and which promises good results is what I may call a far-sight machine. By means of this I hope to be able to increase the range of vision by hundreds of miles so that a man in New York could see the features of his friends in Boston with as much ease as he could see a performance upon the stage. That would be one invention worthy of a prominent place in the World's Fair, and I hope to have it perfected long before 1892. But that is not all. I can safely promise many inprovements in electric inventions of many kinds which will interest and instruct visitors from all portions of the world."

MOON AND FLOODS.—Grandfather Smith of Punkeutawney, Pa., who was gathered to his fathers several years ago, used to say, after the great flood of 1861, that it was all in the moon. "Whenever," he said, "the moon changes at 11 o'clock and 59 minutes in the daytime on June 1st, you may look out for heavy rains and a big flood. I have seen two or three great floods during my lifetime, and they were all caused by the change of the moon at this particular time—11:59, June 1st. When the change of the moon comes again at that time, look out." Several of the citizens remembered this, and, looking up the almanac, found that the change of the moon took place on June 1, 1889, precisely at 11:59, and in consequence they marvel much.

THE LATEST STATISTICS of Krupp's establishment are supplied in a book just published at Essen. In 1833 it had nine workmen; in 1848, 74. In July, 1888, it employed 20,960 men, of whom 13,626 were at Essen, and including the families of the workmen, it supported a population of 73,769 souls, of whom 24,193 lived in the houses it provides. There are at Essen 1195 furnaces of various constructions, 286 boilers, 92 steam hammers, of from 100 to 50,000 kil., 370 steam engines, with a total of 27,000 horse-power, 1724 different machines, and 361 cranes. Of coal and coke 2735 tons are used daily, and 11 blast furnaces of the latest construction produce nearly 600 tons of iron per day.—*Engineering.*

GROWTH OF THE INDIA-RUBBER BUSINESS.—Dr. Priestly wrote in 1770 that he had seen "a substance excellently adapted to the purpose of wiping from paper the marks of a black lead-pencil." This was india-rubber in cakes half an inch square, which were sold at 75 cents each. Rubber is now made into tires and springs for wagons, jewelry, combs, knife handles, boxes, dishes, coats, tents, shoes, buckets, and hundreds of other articles. In this country we import annually about 14,000,000 pounds of crude rubber at a cost of about $10,000,000.

AMERICANS AHEAD BUT CARELESS.—Some one has said that "the Americans were born 20 minutes ahead of time, and are continually trying to gain another minute." Here is the cause of half the accidents that occur. The other half is caused by "don't care" and "it's none of my business," in equal proportions.

ELECTRICITY.

Progress of Electrical Applications.

No other scientific subject on earth has received greater attention during the last few years than electricity and the uses to which it may be applied; and yet its development from an industrial standpoint is but in its infancy. It is used to lend vitality and strength to the human system and to take human life. It is to-day the greatest commercial factor on earth, and is fast becoming indispensable in the household. Nations, states and cities are by it brought into direct verbal communication.

According to creditable reports there are at this writing 3351 isolated electric lighting plants and central stations in the United States alone that are nightly operating 192,500 arc and 1,925,000 incandescent lights. There are 459,495 horse power of steam engines devoted to electric lighting. The capital invested in the electric lighting companies during the past half year has been increased to the extent of $42,210,100. In April last there were in this country 59 electric railways, with 309 miles of track, operating 440 motor cars, and utilizing about 8000 horse power for stationary engines. Forty-nine new roads were in February last being built, having a total of 189 miles of track and to use 244 motor cars. There are also several motor factories, some of them employing as many as 1200 men.

In medical treatment nothing has shown more marked advance than the application of electricity. The galvanic battery is in some degree taking the place of surgery and offering a mild or at least unterrifying procedure in place of the knife. For some painful diseases peculiar to woman this—in the hands of a skillful and experienced physician—benign agency has been proved of high remedial virtue. Apostoli, Engelmann, Hutchinson, Cook, have obtained results of surprising efficacy in cases where the physician had pronounced a radical operation of doubtful value.

The use of electricity for conveying power from central stations in cities to small shops, factories, printing offices, etc., is of inestimable value, and its use for such purposes is rapidly increasing. For conveying power from inaccessible or inconvenient water-power centers, it is coming largely into use.

Its introduction for welding purposes has already proven of great importance, and is vastly enlarging the application of iron welding to many purposes for which it has hitherto been inapplicable.

Electricity has proven of especial value in welding copper.

The exclusive use of electricity on board ships-of-war for firing guns and for various other purposes seems to be only a question of time—and a very short time at that. The electrical appliances for these naval uses are being perfected with great rapidity.

A French electrician claims that he will soon be able to produce a thunder storm wherever and whenever desired.

What Edison has been able to accomplish by this agency is really wonderful; but what he promises to do in the near future is still more remarkable. The tremendous development of electrical science the world over is well illustrated at the Paris Exposition. There are 500 exhibitors of electrical apparatus. They come from 18 countries. Edison is there with his 500 inventions, and this is by far the most extensive exhibit made by any one person from any country represented.

It is a generally acknowledged fact that notwithstanding what has already been accomplished by the aid of electricity, that wonderful agency is still only in the infancy of its development.

WELDING BY ELECTRICITY.—The possibility of welding by electricity has been known longer than is generally supposed, Prof. Elihu Thomson having accidentally melted together wires of an induction coil some 11 years ago. This mishap was the germ of a process likely to find an almost infinite variety of applications, such as the welding of gold rings, steel axes, parts of locomotives, boiler plates, tubes, wire lines, lead pipes, etc. Among the advantages of electric welding are an absolutely pure heat (that is, a heat free from harmful gasses), absolute means of regulation, heating constantly before the eyes of the operator, a neatness to which ordinary methods cannot at all be compared, an increased economy of at least 300 per cent in most cases; absolute safety of handling apparatus, and portability of the apparatus for use in repairing, etc.

AN ELECTRICAL SUBSTITUTE FOR THE MARINERS' COMPASS.—The London *Electrician* prints a singular rumor to the effect that the use of the compass is about to be altogether superseded. A method is said to have been discovered by which the true north may at any moment be ascertained by means of a device which is wholly independent of magnetic action. The reading is, however, obtained by electrical means, and it is said that a well-known Berlin firm of electricians has secured the patents. The informant also surmises that gyroscopic action is also involved.

SAFETY IN ELECTRICITY.—There are 1300 buildings in Philadelphia supplied with electricity for light or power purposes, and in not one of these has there been any loss by fire for the past two years.

Passing Events.

The destruction of the smelting furnaces of the Eureka Consolidated mine, at Eureka, Nev., entails a loss of about $250,000. The plant was a very fine one and its destruction by fire will seriously injure Eureka and its surroundings.

In the past few weeks several very disastrous fires have occurred on this coast. The flourishing town of Bakersfield, Kern county, is the last to have met with serious loss.

Fresno county seems to be coming to the front with productive quartz mines. The quartz interests of that county have only attracted attention of late years, but many fine ledges have been developed.

The shaft in the Idaho mine has been reopened and the bodies of the two miners imprisoned at the time of the fire recovered. The fire in the mine has been extinguished, but the extent of the damage has not been ascertained.

Money has been donated to purchase the largest photographic telescope ever made, and this, when completed, will be placed in position on one of the mountains in the southern part of this State.

THE ceremony of laying the corner-stone of the new Academy of Sciences building on Market street, near Fourth, took place this week too late for us to make more than a reference to it.

A Photographic Telescope.

Photography is rapidly changing the older methods of astronomical study. It gives an accurate representation of many objects at the same time; and, since copies may be easily made, it permits the results to be studied at leisure at any place and time. In a recent paper before the National Academy of Sciences, Prof. Edward C. Pickering of Harvard College Observatory recommended the construction of a large photographic telescope with a lens like that used by photographers, rather than like that of an astronomical telescope.

In November of last year this gentleman published a circular giving his ideas on the subject and making an appeal for the money necessary to make this instrument. In this circular he suggested that the photographic telescope should be placed on one of the mountains of the southern part of California, where climatic conditions especially favorable exist. He stated that it was proposed to establish in that section an astronomical observatory, and hoped to see the form of instrument suggested become a part of that observatory. He called attention to the fact that in California the interest in astronomy is widespread and the atmospheric conditions are excellent.

It seems that this appeal of Prof. Pickering has met with a ready response. The astronomical observatory of Harvard College has just received from Miss C. W. Bruce of New York a gift of $50,000, to be applied "to the construction of a photographic telescope having an objective of about 24 inches aperture, with a focal length of about 11 feet, and of the character described by the director in his circular of November last; also to secure its use under favorable climatic conditions in such a way as in his judgment will best advance astronomical science."

This will undoubtedly insure another large photographic telescope for California, this time under the management of Harvard College.

This instrument, Prof. Pickering states, will differ from other large telescopes in the construction of its object-glass, which will be a compound lens of the form used by photographers and known as a portrait lens. The focal length of such a lens is very small compared with its diameter, and much fainter stars can be photographed in consequence. The advantage is even greater in photographing nebulæ or other faint surfaces. Moreover, this form of lens will enable each photographic plate to cover an area several times as great as that which is covered by an instrument of the usual form.

With the 24-inch aperture each photograph will be 13 inches on a side and will cover a portion of the sky five degrees square, on a scale of one minute to a millimeter. The dimensions will be the same as those of the standard charts of Chacornac and Peters. The entire sky would be depicted upon about 2000 of such charts.

In Europe and in the eastern portions of the United States, where nine-tenths of the principal observatories of the world are situated, it is cloudy for a large portion of the year. Great advantages are expected from a location where clouds and haze are seldom seen. All the stars north of —30 degrees can be advantageously photographed in the latitude of Southern California. This region, covering three-quarters of the sky, has an area of 30,000 square degrees. There are 3600 hours of darkness in a year; and even allowing one-half for clouds and moonlight, and one-third of the remainder for imperfect plates, it would not take a very long time to do the whole work. By using a prism to cover the lens, the spectra of all the stars may be taken in the same way and at the same time. When this work is completed, it should be repeated, since we ought to have a complete map of the sky at intervals of about five or ten years to detect changes.

The faintest stars photographed with the eight-inch telescope at Cambridge are invisible with the 15-inch telescope. The inner satellites of Uranus have been photographed at Cambridge with a 13 inch lens, although they are among the most difficult test objects known. We may therefore expect that stars too faint to be detected with any other instrument might be photographed with the 24-inch lens. We thus see that any person could obtain at a comparatively small cost a map of a portion of the sky showing stars too faint for him to observe in any other way. Many investigations may be carried on by means of these plates; for instance, a search for double stars, for nebulæ, for asteriods, for variable stars by comparison of plates of the same region taken on different nights, for stars having large proper motion when we have the plates repeated after a considerable interval of time. In all these cases the plate furnishes an accurate measure of the object discovered. The number of the stars photographed on the chart would be vast. In some cases it is estimated that 20,000 or 30,000 stars have been photographed on a single plate

It is hoped that an endowment of $100,000 will be made, which will keep this instrument permanently at work. California now has the largest and most powerful astronomical telescope in the world, and this action gives it also the largest telescope to be used for solely photographic purposes.

Silver Facts and Figures.

NUMBER 3.

Turning from the favorable statistical position of silver the world over, to its low price and its depressing influence on wheat and cotton, it is surprisingly strange that no administration in this country has risen to the occasion to not only carry out the full text of the Act passed by Congress in 1878, requiring the minting of 4,000,000 standard dollars a month, but also to declare in favor of free coinage of silver.

View it in whatever light we may, still there is no denying that England is the true rival of the United States. It is the fear of this country assuming an aggressive commercial course that is ever uppermost in the British statesmen's thoughts, and to keep us from it, there is no doubt but the ruling class in England wish us to suspend the coinage of silver indefinitely. They know that such action would depress the price of silver still more, notwithstanding it would lessen in like proportion the sterling value of the rupee in the Indian Empire, and the rouble in Russia. But England generally continues to keep her ablest statesmen in the service of the Government, and their course gives color to the generally accepted belief that they never hesitate to sacrifice a small present advantage for a large future gain. This is one of the causes which has made England mistress of the seas—the greatest power in this respect that exists or that ever existed. Her statesmen are trained from their youth; they look out for British interests; they serve England with the same watchful devotion a faithful lawyer serves his client, and their fees are the grand honors and emoluments which England always bestows for recognized great services. With silver low, Great Britain sees her agricultural interests prostrated, her farm rents fade away, but she recognizes the fact that her enduring greatness does not depend upon farming, but on her commerce and manufactures.

As early as 1833 we began to boast that "cotton was king," and that England could not get along without our cotton. The ever-watchful statesmen of England began to see that there was peril in our boast, and Sir Robert Peel, while urging in the British Parliament the passage of an act (which was passed in 1833), appropriating twenty million pounds sterling to purchase the freedom of the slaves in the British colonies, did not affect any especial sentiment about the wrongs of slavery, but suggested that the freeing the negroes in the West Indies would finally dissolve the American Union. It is the history of that time that soon after the liberation of the slaves, the reproach of "American slavery" was rudely thrown into the face of every American traveling abroad, until the North want to war to preserve the Union, when forthwith the ruling class in England, with scarcely an exception, took sides with the slaveholder, and confidently expected, and by their action gave expression to an ardent desire for, a dissolution of the Union.

In 1879 the export of wheat from this country was 153,000,000 bushels, while the export from India for the same year was only about 4,000,000 bushels. Seven years after, in 1886, the exports from the United States had fallen to 57,000,000 bushels, and the export from India had risen to 39,000,000. Not only had our exports of wheat lessened but the price at the Atlantic seaboard had fallen from an average of $1.24 a bushel the first half of the year of 1879 to an average of 84 cents the first half of the year 1886. Upon these facts, taken from the bureau of statistics, there is no necessity for comments. The price of American wheat has also been directly depressed by contraction of the actual circulation of the currency. In the report of our Silver Commission, made in 1877, ex-Governor Boutwell, at one time United States Secretary of Treasury (Vol. 1, page 138,) says: "It is no doubt true that the demonetization of either metal adds to the purchasing power of the metal retained for use, by diminishing the price of every article of merchandise, while it increases the burden of debts, both public and private." This assertion is carried out in the inquiry of the Royal Commission, which showed that the "index number" representing the combined prices of 22 leading commodities in England was at the close of 1872, 2947, and at the close of 1886, 2059. This shows a great falling off in prices since the United States in 1873 joined the kingly raid against silver.

Soon after we had banished the silver dollar from coinage by the Act of Feb. 12, 1873, and made the gold dollar the unit of value, England abolished the export duty on wheat from India. England with all her dependencies produces no silver worth considering, but her gold interests in Australia are vast, with her African possessions coming to the front as large producers. All her legislation in the direction of the precious metals has been aimed to enhance the value of gold and degrade that of silver. By act of Parliament, silver, as standard coin, is banished from the realm, and by Acts VII and VIII Victoria, chapter 32, the Bank of England is compelled to purchase all gold bullion of 22 carats fine at £3 17s. 9d. per ounce, however much may be offered.

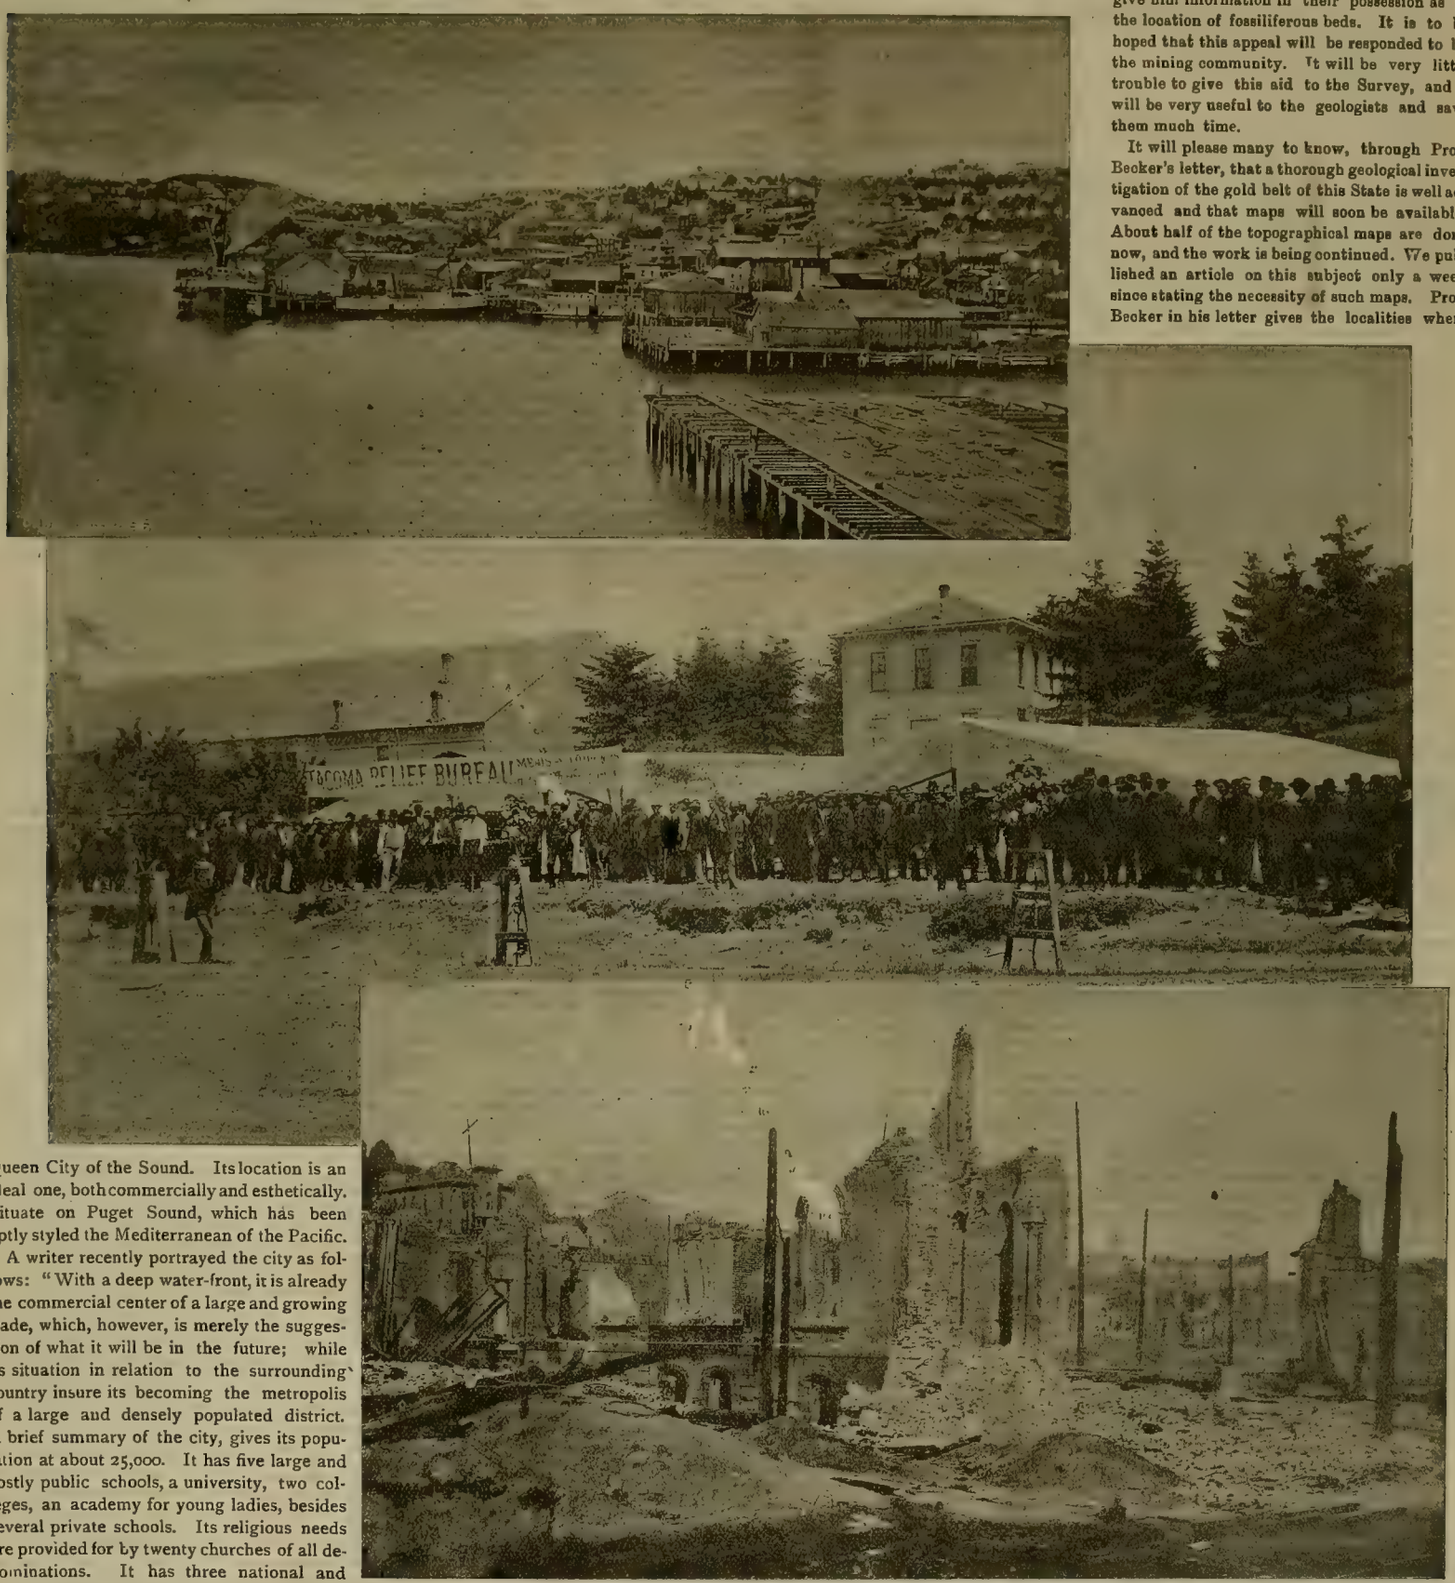
At a meeting of the British and Colonial Chamber of Commerce, held in London in June, 1885, Sir Robert Fowler, Member of Parliament and ex-Lord Mayor of England, is reported to have said "that the effect of the depreciation of silver must finally be the ruin of the wheat and cotton industries of America, and be the development of India as the chief wheat and cotton exporter of the world."

Until the United States in 1873 joined the crusade against silver the average value of the bullion in the London market—for long years—was over 60d. an ounce. In May, 1888, it fell at one time as low as 41⅛d., the lowest ever before known. The fall of silver and the export of Indian wheat and cotton incident to that fall, as the late Secretary of Treasury Manning justly said, has cost us millions on millions of dollars.

In the light of the above it is clear to all thinking minds that England is our rival, and hence it is time that we cease to expect her to join us with an earnest desire in any convention which will tend to an international agreement about silver. If we, with all our boundless resources, cannot construct a system of finance suited to our wants, but remain dependent on England, we may as well acknowledge that we are unequal to the responsibility which God and nature has laid upon us.

THE CALICO MINING SUIT.—In the United States Circuit Court at Los Angeles, on Monday, Judge Ross reinstated on the calender the sensational mining suit involving the property in Calico district of the Waterloo Mining Company against John S. Doe, Diedrich Bahten and James L. Patterson. The suit was dismissed July 2d by Judge Ross on a technicality. To-day A. H. Rickatts, attorney for the plaintiffs, appeared before the court and established the fact that the application for a dismissal had been improperly made under the rules, the time for filing plaintiff's replication not having expired. Judge Ross stopped the counsel in the midst of the argument, and stated that the position taken was correct and that the order dismissing the case should never have been made. The action is now restored to precisely the same footing as before. The suit is for $500,000 damages, the complaint alleging that Doe has jumped and illegally held the claim known as Oregon No. 3, claimed as the property of the plaintiff. Ten days were given to the plaintiffs to file a replication.

THE Omnibus R. R. Co. has commenced work on its Post-street branch, which will be a cable road. It will require $2,000,000 for the construction and equipment of the system of this company, all of which will be spent here among California manufacturers and laborers.



Seattle—Before and After the Fire.

We give on this page a series of views in connection with the late disastrous fire at Seattle, from original photographs by Boyd of that city. The first is a view of the city before it was visited by the recent calamity, which shows that it well deserves the title of Queen City of the Sound. Its location is an ideal one, both commercially and esthetically. Situate on Puget Sound, which has been aptly styled the Mediterranean of the Pacific.

A writer recently portrayed the city as follows: "With a deep water-front, it is already the commercial center of a large and growing trade, which, however, is merely the suggestion of what it will be in the future; while its situation in relation to the surrounding country insure its becoming the metropolis of a large and densely populated district. A brief summary of the city, gives its population at about 25,000. It has five large and costly public schools, a university, two colleges, an academy for young ladies, besides several private schools. Its religious needs are provided for by twenty churches of all denominations. It has three national and several private banks, three hospitals and an orphan's home. It supports four daily, and several weekly journals, and is a teeming hive of industry where all kinds and conditions of men may find congenial occupation.

Our second illustration is relief tents supplied by the people of Tacoma after the fire at Seattle, for the purpose of rendering aid for the sufferers. Their city is also favorably located on the Sound, and has sometimes been regarded as a rival of its more prosperous but unfortunate neighbor, whose enterprise and growth have been regarded at times with no little jealousy by the Tacomaites. This was all forgotten, however, in the overwhelming calamity which has befallen Seattle, and all envious thoughts of rivalry were obliterated by that sympathy for the unfortunate—that "touch of nature" which "makes the whole world kin" and is a redeeming feature in a generally selfish world.

Our third picture is of the ruins of the Puget Sound National bank in the Occidental hotel block after the fire had done its destructive work. This is but one of a number of similar views taken by the artist, showing the devastation left in the track of the devouring element. The better part of Chicago was wiped out by the upsetting of a coal-oil lamp. The igniting of a pot of glue involved the destruction of buildings covering an area of one hundred and thirty acres, and of the valuation of fifteen million dollars at Seattle. It is gratifying to know, that though the loss has been so severe, entailing absolute ruin to so many worthy and enterprising citizens, that the people of Seattle are already at work with characteristic American energy rebuilding the desolate places of their ruined city.

SCENES IN SEATTLE BEFORE AND AFTER THE GREAT FIRE

SAN DIEGO now talks of a smelting plant to cost $40,000. The *Sun* says: "It will be known as the San Diego Smelting and Refining Works. The erection of this smelter will bring to San Diego a large tonnage of ores from Altanta, Culican and West Mexico generally that now go to Swansea, Baltimore, San Francisco and elsewhere."

THE advance guard of the hydrographic surveying party, which will take a preliminary look at the watershed of the eastern slope of the Sierra, arrived in Carson last week.

THE trustees have authorized the immediate construction of the Lick free baths. The building is to be ready by Dec. 1st.

The California Gold Belt.

On page 22 of this number of the PRESS will be found a letter from Prof. Geo. F. Becker of the U. S. Geological Survey with regard to the location of fossils on the gold belt of this State. He asks that those in a position to do so wil forward to him such fossils as they may find or give him information in their possession as to the location of fossiliferous beds. It is to be hoped that this appeal will be responded to by the mining community. It will be very little trouble to give this aid to the Survey, and it will be very useful to the geologists and save them much time.

It will please many to know, through Prof. Becker's letter, that a thorough geological investigation of the gold belt of this State is well advanced and that maps will soon be available. About half of the topographical maps are done now, and the work is being continued. We published an article on this subject only a week since stating the necessity of such maps. Prof. Becker in his letter gives the localities where fossils have already been found, but doubtless there are many other places known to the residents but of which the geologists have no information. It is to be hoped that our cotemporaries in the mining regions will give further publicity to Prof. Becker's request, as it is a matter of public interest, and one which should be attended to.

QUICKSILVER.—The article on page 22 in this number of the PRESS, by Henry G. Hanks, has been copyrighted by the author. Mr. Hanks intends writing several articles on this subject, which will, in due time, appear in this paper.

Coast Fires.

The destruction by fire of the furnace of the Eureka Consolidated Mining Co., at Eureka, Nev., will seriously affect the mining interests of that section, although there has been a great deal of grumbling among the miners at the charges made by the smelters there for working custom ore. It was only last week that the local paper scored the managers of the smelting works at Eureka for combining to the detriment of the general interests of the camp.

We have been exceedingly unlucky on this coast of late in the matter of fires. Others quickly followed the disastrous conflagration at Seattle, though that was the worst that ever occurred this side of the Missouri river. At Vancouver, W. T., on the 22d ult. there was a large fire. Hailey, Idaho, has been almost destroyed. Then the town of Ellensburg, W. T., was swept by the flames which burned up 14 blocks of the business portion. Following this came an immense fire at Bakersfield, Kern Co., where 13 blocks were burned over, leaving the enterprising town a mass of smoking ruins. Then came the fire at Eureka, Nev., followed by the destruction of Fresno's Chinatown. The insurance companies are having hard luck, for these numerous losses, coming so soon after the great Seattle disaster, are severely felt.

In most of these cases the fire departments of the town were powerless to cope with the flames. In truth we are no better off in San Francisco than these smaller places in this respect. Our department is not on a metropolitan scale by any means, and will not be until we have a full-paid department as do other large cities. We have only three men to an engine and two to a hose company, who are paid to be on service all the time. The rest of the force is made up of extra men who work at other occupations, answering alarms but getting to a fire the best they can. All the firemen ought to be on full pay and kept in readiness to ride to a fire and be in condition for work when they get there. We have not a proper proportion of engines for so large a city, and we are very short of hose, no extra supply being kept on hand.

In this city we are peculiarly subject to fires. Our long dry summers and prevailing strong winds make it difficult to control fires if they once get a start. The city is a wooden one and closely built up. It would seem, therefore, that every effort should be made to get the firemen to the spot as soon as possible after an alarm. Provision should be made for them to ride, both as a means of speed and that they shall not arrive out of breath and unfit for active work.

It is understood by those in a position to know, that our fire department here is a good one as far as it goes, but it does not go far enough. It is able to control a large fire, but should a conflagration occur, it would be powerless, and immense damage would result. We ought to take the experiences of other cities and not wait for one of our own of this kind. In what is known as the foundry or lumber district, south of Market street, there is a vast amount of property that might be destroyed any day should a fire once get the upper hand. Only about 40 per cent of the property in San Francisco is insured, so the citizens are more interested than the underwriters in this matter. The subject is one that demands immediate attention. The chief engineer has asked for many things which economy has denied him. But it is a false economy not to provide for contingencies under the existing conditions.

ELECTRICAL POWER AND MILLS.—The Virginia *Enterprise* says: "Owing to the great scarcity of water in Marlette lake, the Nevada mill, which has been run by water-power, electrically conducted, has been forced to hang up its stamps, and ore shipments from the Hale and Norcross have in consequence been temporarily suspended. The electric plant was working as well on the last day of the working of the mills as at any other time since it started. Its exact value, as compared to steam, direct Pelton wheel water-power, or power transmitted from Pelton wheels by wire ropes, has not been figured out by the management."

MAKING A LAP WELD.—If trouble is experienced in making a lap weld, says the *Practical Mechanic*, and if one end of the weld refuses to stick, open that place with a chisel, lay in a piece of Russia sheet iron, close the weld and take another heat. It is almost sure to stick after such treatment. Soft iron filings may be employed with equal results.

THE Comstock pay-rolls for June aggregated $199,496.

WHEAT AND FLOUR.

Raising Wheat at Half a Cent a Pound.

"What is the lowest figure at which wheat can be grown so as to leave a living profit for the farmer?" is a question which has been discussed at greater length, probably, than almost anything else in the domain of agriculture. The elements which enter into the problem are of course different in each of the great wheat-growing regions of the world. The prices paid for land, labor and transportation, and the different methods of cultivation and harvesting employed, are of such great divergence in the different wheat-producing regions that anything like a general rule cannot be laid down. One thing only is certain, however, and that is that no matter what the difference in cost of production may be, the grain-growers of England, America, Australia or India, all meet on a common ground when they seek the great wheat markets of the world.

For our present purpose, we confine our remarks to California and under all the most favorable conditions which can be found in this highly favored region. We take the figures of an intelligent Tulare county wheat-grower—Mr. G. S. Berry—the owner of some 4000 acres of wheat land in that county, who communicated the facts some months ago to a correspondent of a San Francisco daily paper, from which we collate as follows:

Mr. Berry found, as all wheat-growers know, that the outlay for purchasing and maintaining the teams necessary to cultivate so large a wheat ranch, with the sum paid for manual labor, represented a good share of the cost of producing his crops. Naturally, then, his efforts were directed toward ascertaining if there were not some method of reducing this cost. The horses or other animals necessary for plowing and harvesting were in use but a portion of the year, and for several months they required a large outlay for feed while bringing in nothing. Consequently the idea suggested itself that steam might be utilized to take the place of the numerous teams and accompanying drivers. After considerable experiment, Mr. Berry invented a traction engine, by which at first a combined harvester and thrasher were operated most successfully. This engine is of 30-horse power and weighs 15 tons.

Plowing by Steam.

Finding that the traction engine worked with success in operating the harvester and thrasher, the next step was a natural one. Why should not the plows be operated in the same manner? This question was quickly solved. It required, of course, some experimenting to determine the best means to be used so as to secure the best results; but all difficulties have been met and solved, and now the entire work of cultivating and harvesting this immense 4000-acre wheat-field is done by the powerful aid of steam. Five gangs of four plows each are attached to the engine with chains, each gang having a separate connection. The plows cut a furrow ten inches wide and five inches deep. The gangs are also connected with each other by chains, so that they cannot spread apart and leave any of the soil untouched.

Working Night and Day.

One of the most important things about the use of steam in plowing is the fact that upon the ranch in question the work of plowing goes on night and day. There is no stopping except for meals. If the land is in good condition, from 70 to 80 acres a day will be plowed, seeded and harrowed, and it is therefore evident that the cost per acre must be a very small sum. Mr. Berry puts the cost for the three years which he has been following this method at 35 cents per acre annually. When the soil is in the most favorable condition it is possible to run as many as seven gangs instead of five, which, of course, largely increases the area plowed daily and correspondingly reduces the cost per acre.

Harvesting by Steam.

With land plowed to a depth of five inches, and with an average rainfall, there will be a good crop ready for the harvester. The steam engine is attached to the combined harvester and thrasher and the grain is quickly reaped in swaths 40 feet wide at a time. For so wide a cut as this the cutting-bar is made in two sections, jointed in the center. It thus is enabled to accommodate itself to any inequalities in the surface of the ground, and the grain is all saved. Actual experiment has shown that in thus harvesting and thrashing at the same operation there is a very large increase in the amount of grain secured as compared with the old system of stacking and thrashing after the harvest is over. From three to eight bushels to the acre are claimed to have been saved in this manner. From 90 to 100 acres a day can be harvested and thrashed when an engine furnishes the motive-power, and the grain is left sewed in sacks and scattered along the route followed by the machine, to be gathered by teams and hauled to a shipping point. With such rapidity in harvesting, it need hardly be said that the cost is reduced to a very low point, 30 cents an acre being given on the average for three years.

Summing Up the Cost.

For convenience in estimating, 100 acres will be taken as a basis for determining the cost per pound of wheat raised in this manner. The plowing and seeding, at 35 cents an acre, would require an outlay of $35. The seed, at an average rate, would cost $60. The harvesting would require $30 more. For three years, which included one very bad season, the average yield has been seven sacks to the acre, or about 840 pounds. The sacks cost eight cents each, or about $56 for the 100 acres. The engine, thrasher and plows cost $7000. Ten per cent on this for the 4000 acres would be 17½ cents an acre, or $17.50 for the 100 acres. The land under discussion cost the present owner but a very small sum, perhaps not over $5 an acre all told. The account would then stand something like this for the 100 acres:

Plowing and seeding	$35 00
Seed	60 00
Harvesting	30 00
Sacks	56 00
Interest on cost of machinery	17 50
Interest on land	30 00
Total cost per 100 acres	$228 50

The receipts would be, at a low valuation, 840 pounds to the acre. The total cost for producing the crop of each acre being $2.28½, it follows that the cost of raising a pound of wheat on the ranch would be .27 of a cent. Adding the average freight charge to San Francisco, .20 of a cent, it is seen that wheat can be laid down at a shipping point, under the methods described here, for half a cent a pound. And that such is the case when practiced upon a large scale Mr. Berry assures your correspondent has been the result of his experience for the past three years. It should, perhaps, be mentioned in this connection, one factor in lowering the cost is found in the fact that the railroad passes directly through the ranch in question, and that the cost of putting the grain on board the cars is therefore nominal. But in any event that would not cut much of a figure in the case, and the fact remains that it is possible for hundreds of thousands of acres of land in California to be devoted to wheat growing by the aid of steam, the crops from which can be sold at a price never yet reached, and still leave a profit for the farmer.

WHEAT AND RAIN.—Mr. Albert Montpellier of the Grangers' bank of this city has published an elaborate table of the rainfall in the principal agricultural districts of California from 1879 to date. It shows that in 1880, on an acreage of 2,240,000 acres seeded to wheat, a crop of 1,700,000 tons was raised; again, in 1884, on an acreage of 3,060,000 acres, 1,500,000 tons were raised, and this season, with 3,300,000 acres seeded to wheat, a crop estimated at 1,500,000 tons will be garnered. In each year named, and they produced the three largest crops in the history of the State, the quantity of rain that fell was not so important a factor as the time at which it fell. For instance, in 1880, taking San Francisco as an illustration, out of a total of 26.66 inches, 10.06 inches fell in April and 1.12 inches in May. The rainfall of each month at all prominent points in the State is given in detail, and altogether the table contains information of great value to all persons interested in California's agricultural future. The argument of the tables is to demonstrate that the wheat crop is in proportion to the rainfall of March and April. His tables, however, do not make the demonstration absolute. They show that the heavy crops of 1880 and 1884 had been preceded by a precipitation of 14.42 inches in March and April of the former, and of 10.10 inches in the same months of the latter year. But they likewise show that the March and April rainfall of 1886 was quite heavy, though that year's crop was light. It seems that more observations will be required to convert what is now a presumption into an actual demonstration.

THE CALIFORNIA WHEAT AND FRUIT CROPS. It appears from statistics carefully prepared by Mr. Montpellier of the Grangers' bank that the wheat acreage in this State has increased a million acres, or nearly 50 per cent, since the beginning of the decade. The development is noteworthy, because it may be said that the grape and fruit industry took its great advance from about 1880. It thus appears that the more valuable crops were not produced at the expense of the wheat crop, but that the latter grew side by side and even faster than they. Both were grown on land which was reclaimed from pasturage. Mr. Montpellier's estimate of the acreage now planted in wheat is 3,3000,000 acres, say one-fourth of all the land under cultivation in the State. It is reckoned that one-third of the total acreage of the State—say 33,000,000 acres—is susceptible of cultivation with a moderate a supply of water. California may thus expand her wheat acreage to 10,000,000 acres without encroaching upon land which ought to be devoted to the cultivation of fruit, and we may live to see a crop harvested which shall approach 5,000,000 tons, which is about the product of Dakota, Illinois, Indiana and Iowa combined. The wheat yield per acre of land in this State varies from 9¾ bushels to 22 bushels, according to the quality of the land and the vicissitudes of the season. Taking one year with another, wheat-growers cannot count on a higher acreage for the whole State than 14 bushels. This is just what Mr. Montpellier allows for this year's crop. With irrigation the average might be doubled—that is to say, we might raise on this year's average nearly 3,000,000 tons of wheat, which would leave us 2,600,000 tons for export.

WHEAT STATISTICS.—Senator John Boggs of Colusa county, says the Woodland *Democrat*, has made a calculation on the Colusa wheat crop and also on that of the State. He says there will be 5,000,000 sacks raised in Colusa county this year and 2,000,000 tons in the State. A little calculation shows that this would load 200,000 cars. Allowing 30 feet to the car, it would make a train 1136 miles long. It would require over 500 cars a day for 365 days to take it out of the State. It would load 2000 ships, allowing 1000 tons to the ships. Allowing 15 sacks to the ton, and each sack 32 inches long, and lay them end to end, they would reach 15,150 miles and have one sack over.

THE MILLSTONE AND ROLLER.—The old, old question "Can a millstone be used to advantage in a modern flour mill?" has recently sprung up again in some of our exchanges on both sides of the water, and it brings out anew all the old arguments and prejudices on that subject. The conclusion reached, founded on the arguments we have heard and read, is that there is a place in the course of reduction where millstones will give more satisfactory results than rollers, and it is a fact that many of the best roller-mills in the country find a few runs of stone extremely desirable.

EUROPE raises 1,200,000,000 bushels of wheat yearly, twice as much as the American production. Our wheat land requires 50,000,000 bushels for seed. We export 95,000,000 bushels.

Obituary.

John B. Ward, a pioneer of this State, died at his home in Alameda, on Saturday last. Mr. Ward first came to this coast on a sailing vessel in 1837, and again returned in 1846 or 1847, since which time he has been a resident of this State. He married into one of the native Californian families; he has not been in business for years. Mr. Ward devoted much of the time during the last year of his life to scientific investigations in certain branches of mechanics, made many inventions and obtained a number of patents. He was greatly interested for a long time in flying machines, and spent thousands of dollars for perfecting mechanical devices to that end. He finally gave that up and devised a peculiar model for vessels with which he experimented, going to New York to obtain the advice of skilled naval architects. Incidental to this he invented several forms of boilers, propellers and a steam engine. He was unable to obtain the assistance of capital to build a vessel on a practical scale, though very confident of ultimate success. Mr. Ward was a man of genial nature, and possessed a great fund of information concerning the stirring events of the early days of California.

Prof. Joshua E. Clayton, the well-known mining engineer and metallurgist, died at Spokane Falls, Washington Territory, on the 4th inst., from the effects of injuries received by a stage accident at Wardner Junction. Prof. Clayton was prominently connected with the mining industry of the coast for many years and was widely known. He was a scientific man with an enviable reputation for integrity and uprightness of character. For a long time Prof. Clayton identified himself with Utah mines, but of late has been more or less in Oregon, Idaho and Montana. There were few "experts" better known than he. It is not many months since he visited the editorial rooms of the PRESS, being then on his way south to examine and report on certain mining properties. He had very great faith in the mineral regions of the Northwest, and has by his pen greatly aided in attracting attention in that direction. Prof. Clayton was a man of scientific attainments and great technical knowledge, whose opinion of a mining property was of great value. He was highly respected by members of his profession and by all with whom he became associated.

On Saturday night last Andrew Carrigan, of the hardware firm of Dunham, Carrigan & Hayden Co., died in San Rafael. Mr. Carrigan, who was 50 years of age, came to California in 1860. His first commercial connections in San Francisco were with the old and well-known firm of Conroy & O'Connor. With others he afterward bought out that firm, and later formed a partnership with B. F. Dunham, under the firm name of Dunham & Carrigan. Not long since the title of the firm was changed to the Dunham, Carrigan & Hayden Co. It has been for many years one of the leading hardware houses of the Pacific Coast. Owing to the industry and integrity of the members of the firm, a very large business has been built up. Mr. Carrigan was well liked by all his associates, and has always been recognized as one of our leading merchants, having a high reputation for business ability and integrity. The pall-bearers at the funeral were James Carolan, L. L. Baker, J. W. Flood, John Woodlock, Irving M. Scott, Henry T. Scott, A. A. Watkins, J. O. B. Gunn, Geo. W. Gibbs, John T. Merrill, L. R. Gibson, Captain Knowles, C. H. Tompkins, James Spiers and A. Loughborough.

The Little Pittsburg.

Horizontal Deposits that Paid Well.

The once famous Little Pittsburg Consolidated Mining Company has gone out of existence, so far as owning mining property is concerned. The property was bought at a judgment sale by the Little Chief Company some months ago. It was not redeemed and the Little Chief took possession of the property.

The Little Pittsburg was once the most widely known property in the West. It is the mine out of which ex Senator Tabor made the greater portion of his fortune, and out of which Messrs Moffat and Chaffee afterward made a large amount of money. It was the bonanza of central interest in the boom of 1879, and the effect of the deal in its stock by Messrs. Moffat, Chaffee and others in 1880 inaugurated the panic in mining stocks and a great distrust of mining investments, from which the country is just emerging.

The Little Pittsburg was discovered in May, 1878, by Messrs. August Riche and George T. Cook, both now well-known citizens of Denver. Mr. Tabor, who then kept a general merchandise store in Leadville, had grub staked them with supplies amounting to about $17 in value. Messrs. Hook and Riche began prospecting on Fryer hill, which was supposed to be a drift or gravel deposit, but on which George Fryer had found lead carbonate ore about three weeks before. Ore was struck in Riche's shaft at a depth of 26 feet. About that time Mr. Tabor offered his interest for $800. The first load of ore dug out—and it was dug out about as dirt is dug out of a cellar—sold for $200. From that time on the product increased rapidly. Then came trouble, with lawsuits looming up in the distance, between the Little Pittsburg, Winnemuc and New Discovery, but Mr. Tabor and his partners settled it by buying both claims. Messrs. Tabor and Riche bought out Hook for $98 000, and this was followed by Messrs. Moffat and Chaffee buying Riche's interest for $263,500. Late in 1878 the Little Pittsburg Consolidated was formed, the claims embraced being the three mentioned with the Dives added. There were large bodies of ore in sight then, and the average value per ton was 110 ounces of silver and 22 per cent lead, and about 80 per cent of the total product was net profit. The capital stock of the company was $22 000,000 in $50 shares, and the deal ran stock up to about $40 per share, the principal holders unloading at big prices. Mr. Tabor had previously sold out to Messrs. Moffat and Chaffee.

The Little Pittsburg Co. in the three years following the discovery produced a total value of $4,250 000. The last of the three years the dividends paid amounted to over $1 000,000, and it was upon these dividends, together with the enormous ore bodies reported in sight, that the stock was run up so high. There were large blocks of ore in sight, but they were too low grade to pay for working. This fact was carefully omitted from the statements emanating from reliable sources in the company, but its importance was not noticed by the general public, and they went blindly ahead buying stock, expecting these ore bodies to yield as well as the ore that had been extracted so profitably. Of course it did not, and the crash came. Since then the production of the mine has not been very important, as it was practically exhausted. There is some unexplored territory on the property, but it is not very promising.

The Little Chief crosses the Little Pittsburg, cutting it in halves, and the connected and conflicted workings have been the scene of some sharp and death-resulting contests. The Little Chief had enormous ore bodies, and yielded several million dollars, but it, too, is about exhausted. These horizontal deposits are worked out like coal mines, and in that respect are far different from permanent fissure veins. But they have the advantage of yielding their values rapidly, so whatever profit they produce "comes in a hurry." The history of the Little Pittsburg stock deal is an instructive one for investors to study. It does not follow that because a mine of limited territory pays large dividends this year it will continue to pay them for other years to come. In determining the value of a stock or mine, there are a good many things to be considered other than the fact that it is or has been paying large dividends, and has large blocks of ore in sight.—*Mining Industry.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

The Batho Furnace.

(*Continued from page 21.*)

Wailes and Dick, before the British Iron and Steel Institute in 1887.

It is unlike the old-style open-hearth furnaces, which are put into one solid compact building, in which all the apparatus necessary to the various operations are built, in that it consists of five separate wrought-iron cases, all on one level, lined with fire-brick, which form the outside walls of the four regenerators and of the melting chamber.

This arrangement guides the flame downward right on the hearth, and does away with much of the sharp cutting action of the flame on the roof, which thus has to stand the reflected and radiated heat only. The basic lining is separated from the acid by one-fourth to one-half inch only of neutral material in the form of carbon brick or chrome ore. The upper 18 inches of the lining walls of the melting chamber are of silica brick. The Batho furnace is well adapted for the basic process on account of the facility of getting at and replacing the linings. The round regenerator cases have large doors opening into them extending from top to bottom of the regenerators, and the roofs are removable, rendering them very accessible for cleaning out and repairing. It is claimed that repairs can be made in the Batho furnaces very rapidly, records having been made repeatedly of stopping at 10 A. M. Saturday, the furnace allowed to cool off until Sunday morning, when the regenerators were cleaned out and relaid, new linings put into the furnace chamber, heat put on to the furnace Sunday evening, and the furnace prepared to charge for another 15-ton heat on Monday afternoon at 4 P. M. It is also claimed that the furnace heats up very rapidly, a cold 15 ton furnace being heated up ready to charge inside of 24 hours.

TECHNICAL LITERATURE.—The Milwaukee, Wis., National Publishing and Printing Co. has just issued Part I of "Handy Lists of Technical Literature." It is a reference catalogue of books, printed in English, from 1880 to 1888 inclusive, to which is added a select list of books, printed before 1880, and still kept on jobbers' and publishers' lists. Part I treats of useful arts in general, products and processes used in manufacture, technology and trades. The numerous publications, relating to the practical arts, trades and manufactures, have never been properly catalogued. These "Handy Lists" to the technical literature of the last eight years will be found very useful to many. The lists are alphabetically arranged, so that any branch of mechanics, arts or trades can be readily referred to. Those who want to know of all the books referring to any special branch can here find the titles, cost and names of publishers. Other lists will follow this, which just has been published. The little work is a very useful one to people engaged in any mechanical or technical industry.

ROSSITER W. RAYMOND, of the *Engineering and Mining Journal*, and Secretary of the American Institute of Mining Engineers, was in this city during the week. He is not here on professional business, but on a pleasure trip, having come from Denver, where a meeting of the Institute has been held. Mr. Raymond left here on Wednesday night for the Yosemite and from there will go to the Grand canyon of the Colorado, where a stop of several days will be made. The party, which includes several ladies, has a special car. Among others of the party is E. E. Farnow, chief of the Forestry Division, who is investigating the forests of the coast in connection with the irrigation problem which Government officers are now engaged upon.

THAT COMET.—The Director of the Lick Observatory was notified by Prof. Lewis Swift of Rochester, N. Y., of the discovery of a new comet on July 5th. Prof. Holden now says that the comet reported to have been discovered by Prof. Swift on the morning of July 5th is probably that which was discovered by Mr. Barnard at the Lick Observatory on September 2d of last year, and which has been continuously under observation here since that date. There is evidently an error of about one hour and 23 minutes in Prof. Swift's reported position, as no comet, faint or otherwise, was found by Mr. Barnard in the place telegraphed.

The English Dam.

EDITORS PRESS:—Your letter of July 3d and the Press of June 22d and 29th were duly received, and you have my sincere thanks for the same. The description of the breaking of the "English Dam" is the most complete I have seen, but, as you remark in your letter, "it did not in any way treat of the cause of the breakage, which was only incidentally mentioned." This refers, I presume, to the lines quoted from your editorial of June 29th in my letter to you, which I again quote as follows: "Only one of these large dams in California has ever broken, and that was weakened by dynamite, applied by enemies of the owner."

Now, Mr. Editor, I know you would not willfully do an injured community a grievous wrong by casting unjust reflections upon it. I therefore pen these few lines in its behalf, hoping you may find space in your valuable journal for the same. The description said: "Early in the morning the watchman heard two violent explosions and then saw the water pouring through an opening in the upper timber over the crest of the stone work."

They did not *see*, but they *heard*, and yet they were employed to watch it. The break occurred in the "timber over the stonework." Might not some of the timber have become rotten, thus adding to the pressure on the sound timber, causing heavy breaks and sounds like an explosion? And would not to those half-asleep eyes and ears any noise have seemed like an explosion? And again, *that* noise must have resembled more the shock of a continuous earthquake than a dynamite blast. And again, you are betrayed to say it was "applied by enemies of the owner." Doubtless *that* owner, or owners, had many enemies in the region of *that* dam, but a very dull mind can readily perceive who is meant by the innuendo. It is the men who have fought for their homes, lands and lives, in the courts provided by the State and the Nation, who have shown more patience and endurance under the most trying circumstances, especially since the law concerning hydraulic mining has been promulgated and the systematic violation of it has been practiced, than any wrongs recorded in history which men incurred without recourse to violence. If these men are not amenable to the charge of cowardice under this cruel infliction they challenge our admiration for their support of law and order. Please remember that no definite charges have been made—only innuendos, and only to damage a complainant because he could not be be defeated before the bar of justice or civilization. Very truly yours,

Yuba City, July 9, 1889. GEO OHLEYER.

Mining Bureau Contributions.

The following are among the recent additions to the collection of the State Mining Bureau:

Dog-tooth spar, very fine crystals.

Lignite, Del Norte Co., Cal. Said to be in large quantity. R. W. Miller.

Iron ore of fine quality from two large ledges recently discovered in San Bernardino Co., Cal. One of the specimens was partly "loadstone"—natural magnet. H. W. Lake.

Cobalt ore, containing erythrite, smaltite and earthy cobalt, and rich in silver, chiefly in the form of argentite, with some native silver—a very remarkable and interesting combination. O. K. mine, San Gabriel District, Los Angeles Co., Cal. Wm. McEwen.

Gold in quartz crystals; beautiful specimens, Keystone mine, Humbug Creek, Siskiyou Co., Cal. D. Ream.

Bismutite, Antelope Springs, Deep Spring valley, Inyo Co., Cal. S. D. Woodhull.

Fossils from the Umpqua river, Oregon. D. C. Stone.

Pipestone (catlinite) from Jasper, Minnesota. Minneapolis Academy of Sciences.

Copper ore, Buchanan mine, Fresno Co., Cal.

JOSEPH D. GRANT, a graduate of the University of California, has been appointed a member of the Board of Trustees of the Leland Stanford, Jr., University, filling the vacancy occasioned by the death of Wm. Ashburner. The University will probably be open now within a year. The buildings are rapidly going up and assuming the proportions indicated in the plans of the architects. The main quadrangle is completed, and the big dormitory to the right awaits only the finishing touches. It, too, is roofed with Spanish tiles like the rest of the buildings. When Senator Stanford goes East he will probably set about arranging for the engagement of a faculty.

PATTERNMAKERS' STRIKE.—Messrs. Marschutz & Cantrell of the National Iron Works are having trouble with their patternmakers on the subject of employment of apprentices. The proprietors of the foundry will maintain their position as a matter of principle, and do not intend to discharge the apprentice whose employment has aroused the ire of the patternmakers.

THE Great Salt Lake is shrinking at the rate of two inches a week. The temperature averages 82 degrees.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JULY 2, 1889

406,077.—PIPE CUTTER — A. V. Anderson, Stockton, Cal.

406,191.—CASKET PEDESTAL—Belden & Taylor, Oakland, Cal.

406,201.—ORE CONCENTRATOR—M. B. Dodge, S. F.

406,209.—ATTACHMENT FOR BAND SAWING MACHINE—E. S. Gilmore, S. F.

406,396.—BAND SAWING MACHINE—E. S. Gilmore, S. F.

406,051.—COOKING STOVE — William Lamb, Downey, Cal.

406,410.—MOP GRIP—J. H. Ware, Eureka, Cal.

406,156.—METAL CORNER PIECE FOR BOXES—J. C. Weir, S. F.

406,185.—BALL CASTER—J. C. Weir, S. F.

406,118.—INHALER—Henry T. Welch, San Jose, Cal.

The following brief list by telegraph, for July 11th, will appear more complete on receipt of mail advices:

California—T. L. Armstrong and E. Clark of Oakland and G. Cottrell (assignors to Union Fence Manufacturing Company, San Francisco), fence-making machine; C. A. Ashley of Stockton, raising and lowering mechanism for harvester; Walfred Burkman (assigned to C. H. Frost of Los Angeles), brick machine; Jean B. Gerber, San Francisco, submarine boat; Hiram H. Hannore, Santa Cruz, non-heat conducting fabric; James P. Hays, North Temescal, lifting-jack; Byron Jennings, San Jose, pruning shears and fruit picker; Edouard Lainesz, San Francisco, safety device for elevators; Edwin Mobrig, San Francisco, bicycle; Charles T. Tarpenning, Los Angeles, toaster or broiler.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INHALER.—Henry T. Welch, San Jose. No. 406,118. Dated July 2, 1889. The object of this invention is to provide a shapely and convenient appliance for covering the nose and causing medicinal fumes and vapor to constantly rise into the nostrils, whereby such affections as colds, influenza and other forms of catarrh or derangement of mucous membrane may be relieved or cured.

PIPE-CUTTER.—A. V. Anderson, S. F. No. 406,077. Dated July 2, 1889. This improvement in pipe-cutters consists in the arrangement of the stock carrying a cutter-bit and guide-jaw, the bearing ring carried by the stock and about which such stock rotates, and the clamps or jaws of the bearing ring by which it is fixed on the pipe, the operating handle with its connecting strap and pawl and ratchet connection with the stock. The object is to provide a pipe cutter, which can be readily applied to the pipe and operated conveniently in any position.

CASKET PEDESTAL.—Harry B. Belden and Melvin A. Taylor, Oakland. No. 406,191. Dated July 2, 1889. For the purpose of supporting coffins, pedestals of various descriptions have been employed, and it is customary to make these pedestals in black when used for elderly persons and in white when used for children. This necessitates keeping at least two seperate sets on hand, and as they are somewhat expensive these inventors have designed a reversible pedestal in which either black or white may be made the exterior at will.

WELL-BORING APPARATUS.—J. E. Day assignor of one-half to Joseph Pracy, S. F. No. 406,200. Dated July 2, 1889. This improvement in well-boring apparatus consists in a combination of an auger or spiral, by which the boring is accomplished, with the outer tube or casing of a sand pump and valves fitted to the auger-blades, together with cutters forming the edge of the auger, projecting beyond the bottom of the cylinder barrel, the lower part of which is fitted to engage the backs of the cutters.

[From our issue of March 9, 1889.]

The "Mining and Scientific Press."

Any one connected with the mining or other industrial occupations on this coast cannot fail to find matter of interest and value in this and other numbers of the MINING AND SCIENTIFIC PRESS. The various departments of the paper are carefully made up of practical matters useful to all. Our correspondence has increased of late, as has our subscription and advertising patronage. As the oldest mining paper in the United States, the experience of the editors and accumulated facilities of the publishers are of value to the reader. We hope our old subscribers will bring the PRESS to the attention of those who would be benefited by becoming regular patrons.

CONSIDERABLE artesian well sinking is going on throughout the State of Nevada for two very good reasons—one being a needed supply of water, the other to receive the bounty offered by the last Legislature.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

JACALITOS OIL CO., July 9. Object, to bore for oil and manufacture oil products. Capital stock, $100,000. Directors—Timothy Ellsworth, Marcus D. Hyde, John C. Currier, Geo. W. Ross and Wm. Pinkerton.

MORAGA LAND ASSOCIATION, July 10. Object, to deal in land in Alameda and Contra Costa counties. Capital stock, $1,000,000. Directors—A. A. Grant, L. A. Grant, J. A. Burton, Arthur Burton and Edward Dexter.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Commonwealth, July 9, $13,000; Justice, 9, $6446; Butte and Boston, 5, $25,600; Con. Cal. and Virginia, 6, $54,070; Justice, 3, $4297: Hanauer, 2, $4350; 3, $2900; Mt. Diablo, 11, $21,091; Hanauer, 4, $2700; Crescent, 6, $5500; Hanauer, 6, $6400; 9, $2800.

THE Oceanic steamer Alameda, which arrived here Saturday, from Sydney and Auckland, stopped at Apia, June 22, and took off nine officers and 63 men of the U. S. steamer Trenton. The party is in command of Lieut. S. L. Graham, and went to Mare Island navy-yard on their arrival here. Admiral Kimberley, his staff officers, and six men remain in Apia.

THE source of the Lassen county earthquakes seem to have been at Eagle lake, the water in which receded two feet, and it is feared that a subterranean outlet has been opened which may drain the lake. At the lakes the shocks were proceeded by a rumbling sound and accompanied by a loud explosion like a blast set off below ground.

The Crawford English and Manual Training School.

The proper education of the youth of both sexes is, to those who are responsible for their best interests, a question of vital importance. And to parents and guardians the selection of an educational institution best calculated to promote the desired end is a serious and, not seldom, a puzzling matter. The system practiced at the Crawford School, of combining manual training and mental culture, appeals to the practical wisdom of the parent in the present age, as well as to the natural sense and instincts of the pupil.

The course of study embraced in this establishment is comprehensive, comprising language, mathematics, physics, chemistry, geography, history, the commercial and mechanical industries, book-keeping and actual business usage; while especial attention is given to the manners, as well as the moral and physical well-being of the students under its charge. Each department is presided over by a capable and experienced teacher, all being under the management of the principal, Mr. T. O. Crawford, who, as an educator, has a wide and favorable reputation on the Pacific Coast.

For convenience, healthfulness and picturesque beauty, the location of the Crawford School cannot be excelled. The buildings are commodious and substantial, situated amid spacious and handsomely shaded grounds, fronting on one of Oakland's finest streets and sloping back to the beautiful sheet of water known as Lake Merritt.

Those who are interested will do well to send for a catalogue containing full particulars, addressing Mr. T. O. Crawford, Box 593, Oakland, Cal.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Books on Working Ores.

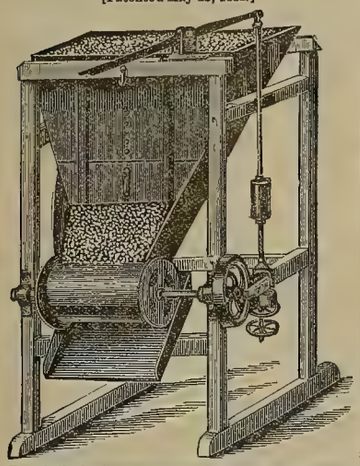
BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & CO., S. F.



Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & CO., Publishers, 220 Market St., San Francisco.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

227 First Street, San Francisco, Cal.

GO TO

American Exchange Hotel,

Sansome St., San Francisco. One door from Bank of Cal.

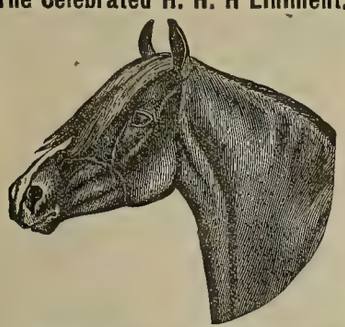
Rates $1, $1 25 and $1.50 Per Day. Free Coach.

The above Hotel is situated in the midst of the Banking and Commercial Houses of the city, and is by far the most home-like and desirable Hotel to stop at.

CHAS. & WM. MONTGOMERY, Prop'rs.

RICORD.

BEWARE OF IMITATIONS.



BUY NONE BUT THE GENUINE.

DR. RICORD'S RESTORATIVE PILLS, a specific for exhausted vitality, physical debility, wasted forces, nervous derangements, constitutional weakness, etc., approved by the Academy of Medicine, Paris, and the medical celebrities of the world. Agents, **J. G. STEELE & CO., 635 Market Street Palace Hotel, San Francisco, Cal.**

☞Sent by mail or express anywhere. Box of 50, $1.25; of 100, $2.00; of 200, $3.50; of 400, $6.00; preparatory pills, $2.00.

☞SEND FOR CIRCULARS.

The Celebrated H. H. H Liniment.

The **H. H. H. Liniment** is for the treatment of the Aches and Pains of Humanity, as well as for the ailments of the beasts of the fields. Testimonials from importers and breeders of blooded stock prove its wonderful curative properties. No man has ever used it for an ache or pain and been dissatisfied.

H. H. MOORE & SONS, Stockton, Cal., Proprietors.

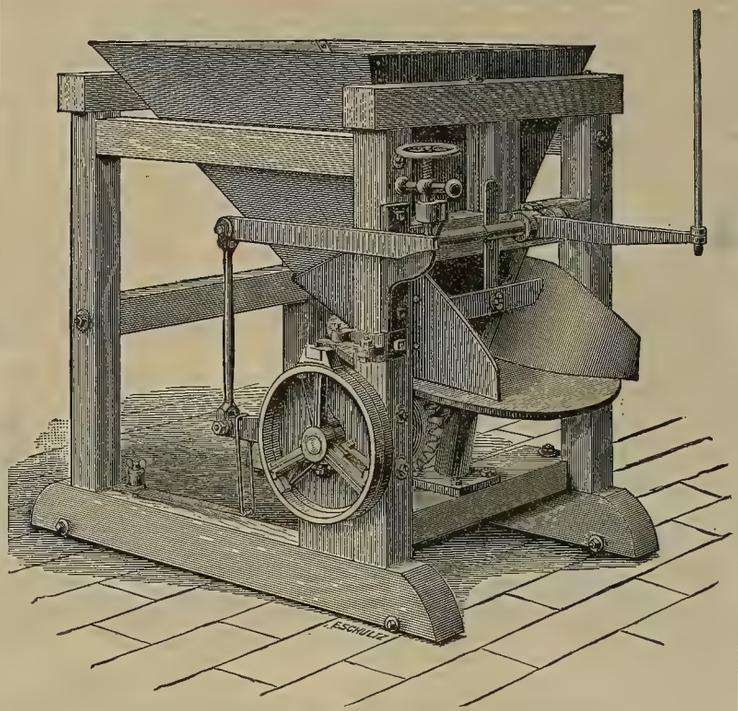
FOR SALE BY ALL DRUGGISTS.

AT A BARGAIN.

A 20-STAMP

Dry Crushing Silver Mill,

With Furnace, Dryer, Pans, Settlers, Steam Power, etc., complete. New and of latest pattern. Can be changed to Wet Crushing if desired. Apply to



PACIFIC IRON WORKS,

127 FIRST STREET, SAN FRANCISCO,

—THE—

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

FREEMAN'S

Dry Process

GOLD SEPARATOR.

They are good machines. If the gold is in the dirt they will save it. They will save finer gold than water will.

T. J. SCOTT,
Osceola, Nevada.

Smith & Drew took out Tuesday, in their dry wash diggings, in addition to 5 ozs. of fine gold, a nugget weighing 22 ozs. The machine used was Freeman's Dry Process Separator.—*Utah Daily Union, May 10, 1889.*

☞Send for descriptive Circular and Price List.

LOS ANGELES, CAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

A New Book on Assaying.

The Newest and Best in the English Language.

IT LEADS ALL OTHERS!

Just Ready.

THE ASSAYERS' MANUAL.

An Abridged Treatise on the Docimastic Examination of Ores, and Furnace and other Artificial Products. By Bruno Kerl, Professor in the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by Wm. T. Brannt, Editor of "The Techno-Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by F. Lynwood Garrison, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 Engravings. Three hundred and fifty-four pages, 8vo., cloth, price $3.00. *By mail, free of postage, to any address in the world.*

Abstract of Contents: GENERAL DIVISION.—I, Mechanical Manipulations; II, Chemical Operations; III, Assay Furnaces; IV, Assay Vessels; V, Balances and Weights; VI, Tools and Implements; VII, Assay Reagents. SPECIAL DIVISION.—I, Lead; II, Copper; III, Silver; IV, Gold; V, Platinum; VI, Nickel; VII, Cobalt; VIII, Zinc; IX, Cadmium; X, Tin; XI, Bismuth, XII, Mercury; XIII, Antimony; XIV, Arsenic; XV, Uranium: XVI, Tungsten; XVII, Chromium; XVIII, Manganese; XIX, Sulphur; XX, Fuels; Appendix; Index.

☞*A circular of 8 pages, quarto, giving the full Table of Contents of this Important Book, as well as a new List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will send his address.*

☞*The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.*

☞*Our New and Revised Catalogue of Practical and Scientific Books, 84 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.*

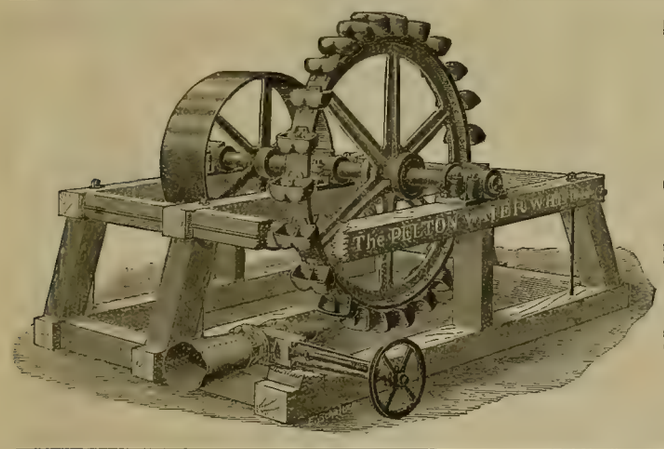
JAMES LEFFEL'S

Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.



Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 11, 1889.

Trade the past week was fair for the season. Traveling salesmen, as a rule, report interior merchants, with few exceptions, carrying light stocks, and consequently when buying sets in a very large trade is anticipated for. The large crops in this State, Oregon and Washington, combined with a strong advancing market for cereals, are creating a better feeling with the trade, and in consequence the hesitating, offish character of pushing business is now giving way to a more general desire of placing large lines of goods.

The local money market is easy. The payments being made on interest accounts, dividends, etc., aggregate larger this year than before known. Considerable money has been used for two or three years past in purchasing interior county, city and other bonds and securities, the interest on which amounts to a large sum. All the money so received will go into general circulation. Remittances from the interior are light, but then the coin sent into the interior to move the grain crops is, as yet, also light. The inquiry for funds from merchants is almost nil, as it is for speculative purposes. The only thing offering inducements to speculators is wheat and barley. Mining stocks are worked by manipulators too much in the way of the old game "head I win, tail you lose," to invite buying by outside capitalists and large speculators. It will take a genuine ore development to draw in moneyed men. Local securities are too high to offer safe or profitable investments.

For the week ending last Saturday, there was $187,345 placed on realty in this city, mostly at the rate of 6 per cent a year.

The last steamer for China took out the following treasure: For Hongkong, silver bullion, $46,500; Mexican dollars, 183,763; gold coin, $4562; gold dust, $70. Total, $234,895. For Shanghai, $25,160 in silver bullion.

The shipments of treasure from this city in June were as follows:

	1888.	1889.
Silver bars	$1,432,300	$864,700
Mexican dollars	323,588	1,078,355
Peruvian dollars	3,400	.....
Silver coin	6,700	3,600
Gold coin	1,135,420	144 978
Gold dust	1,710	985
Currency	190,250	157,000
Total	$3,093,318	$2,249,618

The amounts and descriptions of specie shipped from San Francisco in the first six months of the year compare as follows:

	1888.	1889.
Silver bars	$4,872,650	$4,737,400
Gold bars	1,400	.....
Mexican dollars	1,580,774	4,463,229
South American dollars	5,608	41,131
Gold coin	3,165,633	3,597,672
Silver coin	30,344	37,000
Gold dust	2 326	2,135
Currency	605,230	689,101
Total	$10,255,965	$13,618,369

S. H. Brooks, Assistant Treasurer United States at San Francisco, reports cash on hand June 29, 1889, as follows:

United States notes	$75,921 00
National bank notes	1,255 00
Gold coin	37,773,724 00
Standard silver dollars	18,266,232 00
Fractional silver	6,732,721 25
Gold certificates	4,900 00
Silver certificates	32,335 00
Minor coin	8,102 90
Total	$62,944,741 15

The shipments of silver from the Sub-Treasury, into the interior of the State and elsewhere for the month were as follows:

Standard dollars	$207,500
Fractional silver	68,760
Total	$276,260

Imports of treasure by sea the past week aggregate $15,171 in coin.

SILVER—With a shading off and a weak tone for exchanges, silver has not ruled so largely in advance over New York. The latter market has hardly been up to the London parity, why, it is difficult to say. The latter market is reported to be strong, owing chiefly to large speculative buying of Indian wheat in expectation of better prices. The output of this coast is said to be decreasing, chiefly owing to lessened supply of water for motive power. The yield of the Comstocks is quite light. At the low price of silver it hardly pays to work a silver mine at much of a depth, unless the ore is very rich in mineral. The Comstock mine managers appear to be intent on finding gold-bearing lodes.

MEXICAN DOLLARS—A sharp advance was made the past week, closing the market very strong at 75½ cents for new. The source of supply, it is claimed, is being well concentrated for better handling.

QUICKSILVER—Receipts the past week aggregate 497 flasks. The home demand is only fair, as it is shipping. Prices are nominally unchanged.

LIME—Receipts the past week aggregate only 2814 barrels. The home demand continues free, but for shipping it is light.

BORAX—Receipts are increasing, aggregating the past week 2,062 ctls. The exports the past week aggregate as follows, via C. P. R. R., 227 ctls. to Chicago and 196 ctls. to Pittsburg. The market continues steady with a firm tone reported at the East under a good demand and light stocks.

TIN—The imports the past week aggeegate 3437 ingots from Australia. The market for pigs is in buyers' favor for both spot, to arrive and shipment. The same remarks apply to tinplate. The consumption on this coast this year shows quite a falling off in comparison with 1888, due to a lessened pack of both fruits and salmon. Many packers, it is claimed, will probably carry over quite a liberal stock. On July 5th the London market was quoted as follows: Spot, £88 17s 6d, and three months' futures £89 12s 6d.

COPPER—The market is essentially unchanged. A report is current that the recent combination to sustain prices in this country has been broken, owing to the Tamarack Company not agreeing to lessen their output. The latter company's superior contract with the late French copper syndicate gives it a decided advantage as far as prices are concerned. In London, Chili bars and G. M. B. were quoted July 5th as follows: Spot £41 12s 6d; futures, £41.

LEAD.—The market is barely steady. The consumption is reported to be fully up, if not larger than in this month, 1888. The weak and lower market at the East is the delay of the Treasury in deciding the duty on Mexican ore, which will probably be several weeks before rendered. It is thought that the decision will be against the last ruling and in favor of former rates of duty.

ANTIMONY—The market is strong at an advance.

IRON—The local market is unchanged. The higher advancing freights for outward wheat cargoes here, it is claimed, will cause more to be shipped from England to this port. European mail advices are still of a very hopeful character, notwithstanding the market had a setback, owing to an increase in the output. At the East the market appears to be doing better with large orders hard to place, except at an advance.

COAL—Imports the past week were as follows: From Tacoma, 7495 tons; Nanaimo, 5566; Australia, 2547; Departure bay, 2725; Seattle, 1900; Comox, 4000. Total, 24,233 tons. The market for both house and steam is firm, but no higher. The feeling appears to be decidedly mixed, but as reported the general tenor is bearish, that is, while the impression is that prices for the immediate future will not go lower, yet the largest consumers will not anticipate their wants to any great extent, and with more vessels coming for wheat free shipments of coal to this port will be in order. The tonnage on berth at Newcastle, N. S. W., and Sydney, for this and neighboring ports is steadily increasing. Australian for shipment is offering at $7, while lower bids are submitted by cable.

Eastern Metal Markets.

NEW YORK, July 11, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	—	—	$—	$—	$—
Friday	42½	92	11 75	4 00	19 75
Saturday	42 3-16	92	11 75	3 95	19 80
Monday	42 3-16	92	11 75	3 90	19 75
Tuesday	42 3 16	92	11 75	3 92½	19 50
Wednesday	42 3-16	92½	11 75	3 90	19 50

NEW YORK, July 9.—Borax is firm at the late advance. The arrival of the ship Charmer with 8000 packages helps pressing wants. Quicksilver is unchanged. There have been enlarged deliveries of Lake copper, rumored at 11¾@12c. Baltimore and other casting brands are no dearer. Pig lead is quiet and weak at $3.90@3.92½. Refined petroleum in barrels, $7.20; plain cases, $9.10.

Mining Share Market.

The bears here, like Sullivan at the East, have had things their own way, and each time the bulls came "to time" it has only been to be again knocked out. The bulls claim that the prices for Comstock shares are getting so low they offer inducements to those cash buyers who hold until they get a good profit, even if they have to pay two or more assessments before realizing. The bears still claim that it will take time to get the mines into position so as to make much of an upward move in stocks, and until the situation in the mines is more promising there can not be more than from 50 to 100 per cent, if that, in sight for buyers, and that in risking money in the venture those buying run chances of having to submit to still lower prices.

The bulls claim that never before has so much work been done at any one time than is now being done in the leading mines, and as much of the work is being done in promising quarters, ore is liable to be run into at any time and an upheaval in values follow. They also claim that the bear raids have been engineered by the pool to get in more stock, and in this op nion they think they are confirmed by the large number of assessments that are being levied. They contend that the talk is now all down and no ore, while a few months ago it was all up and plenty of ore in sight and water for motor-power. The decline in the values of the Comstock shares the past week has been from 20 to 30 per cent, with a weak tone ru ing to-day at yesterday's slight advance. Occidental is the only strong stock on the list. Its strength is due to a report that the mill will soon be ready to start up. It is a question whether the ore can be milled yet, for it is quite rebellious. In outside stocks the Tuscaroras are very strong. The move, it is claimed, is being engineered so as to work off stock at a slightly higher range of values, for so far there is nothing in the mines to justify much of a move. Eureka Con. is weak, doubtless owing to the loss of the mill, etc., by fire, and also that a 50-cent assessment is about delinquent. The Quijatoas have been barely steady. There are fewer points out on these stocks, but then trading in them is light. There are bear points still on the Bodies. Doubtless this is one cause of Bodie and Mono going down in sympathy with the Comstocks, but now the low prices put out on the street are about reached.

The news from the mines is about as follows: From the Comstocks, it is reported that the Nevada mill has shut down owing to scarcity of water, as have the other mills that are depending on water-power. The California Pan Mill, Brunswick, and Eureka, are being run by steam. The first and last named are running on Con. Virginia ore, while the other is running on Yellow Jacket ore. On the 1950-foot level, to the extreme west in Con. Virginia, near the Ophir line, a rich vein of ore was struck. It was followed for a distance of about 50 feet when it showed a width of three feet. At this distance a winze was sunk on it to a depth of 12 feet, when the ledge showed a width of seven feet of very rich ore. Further than this we are not advised. In Crown Point more men have been put to work, which probably means the taking out of ore or else more interesting prospecting work. The work going on in Confidence, Challenge, Belcher, and two or three more of the Gold Hill mines is being closely watched. As far as that is concerned, the work going on in all the mines is being closely watched. From the Quijatoa district better news is looked for at an early day, while from the Tuscarora district there is always good news, yet only the inside is supposed to benefit by it. From the Bodies we are unable to obtain thoroughly reliable news. There is a rumor on the street, which we give for what it is worth, that the bulkhead in Bodie is completed, and the water referred to by Superintendent Kelly in his annual report, will soon be, if it is not already, under control. It is also rumored that the work going on in the mine is of a very promising character. So far as that is concerned, nearly everything now-a-days appears to be promise(ing).

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

STEEL BOILERS IN TWO PLATES.

Steam Users, Attention!

The engraving represents our standard Boilers. These boilers are made of STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are bought which have a small hand-hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 1 Steam Drum, 1 Breeching, 1 Smokestack, 300 Feet Galvanized Strand for Guys, 1 C. I. Front Complete, 1 Foundation Plate for Front, 1 Set Grate Bars for Coal or Wood, 1 Back Bar Bearer, 1 Ash Cleaning Door and Frame, 1 Back Arch Plate, 1 Set Binder Braces and Bolts for Brickwork, 1 Stand for Back End of Boiler, 1 Steam Gauge for Syphon, 1 Glass Water Gauge Complete with Column and 3 Gauge Cocks, 1 Safty Valve, 1 Feed Valve, 1 Blow-off Valve, 1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds.

Boilers of the following Sizes in Two Sheets kept Constantly on Hand ready for Shipment: 60 Inches Diameter x 16 Feet Long; 54 Inches Diameter x 16 Feet Long; 48 Inches Diameter x 16 Feet Long; 42 Inches Diameter x 16 Feet Long.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

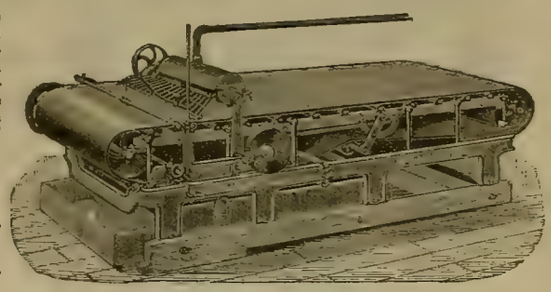
There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.



The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PACIFIC IRON WORKS

1850. 1888.

—BUILDERS OF—

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

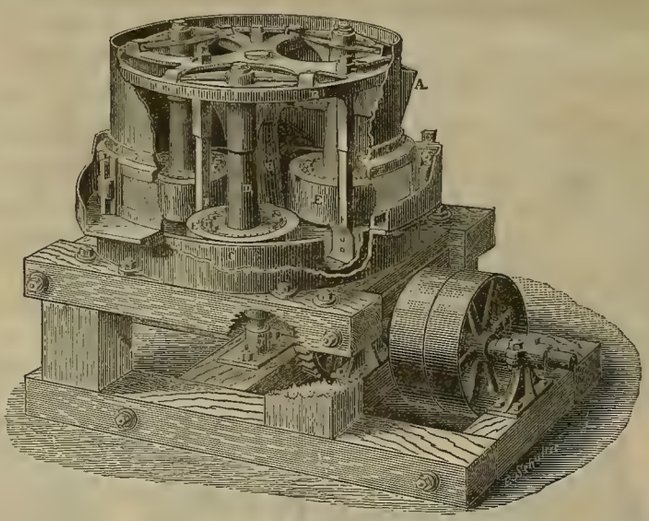
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

Sargeant Rock Drills For Sale.

The undersigned, having seven new 3-inch Sargeant Drills, complete with clamps and columns and three extra tripods, more than they can make use of, will sell all or any one, delivered in San Francisco at much below cost, the price depending on the number ordered.

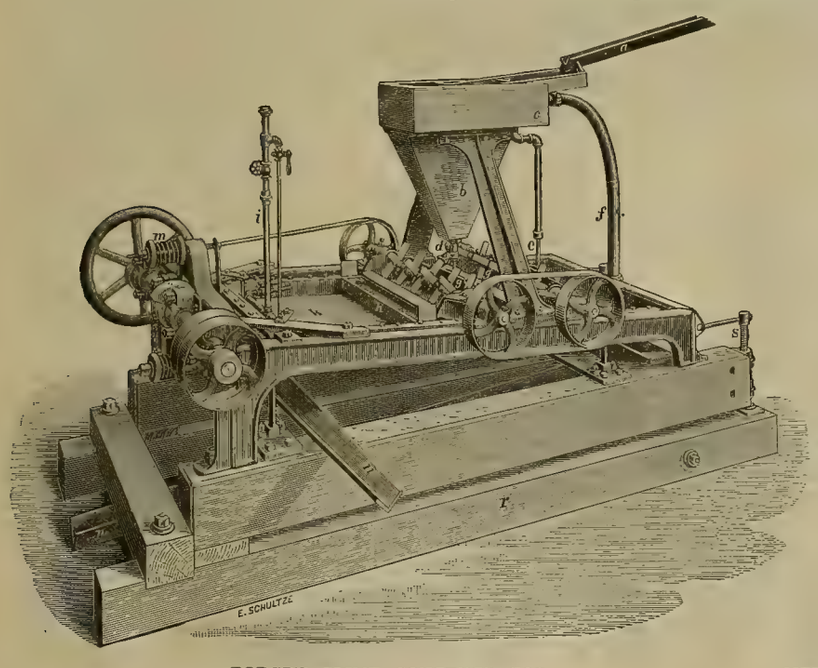
(See page 48)

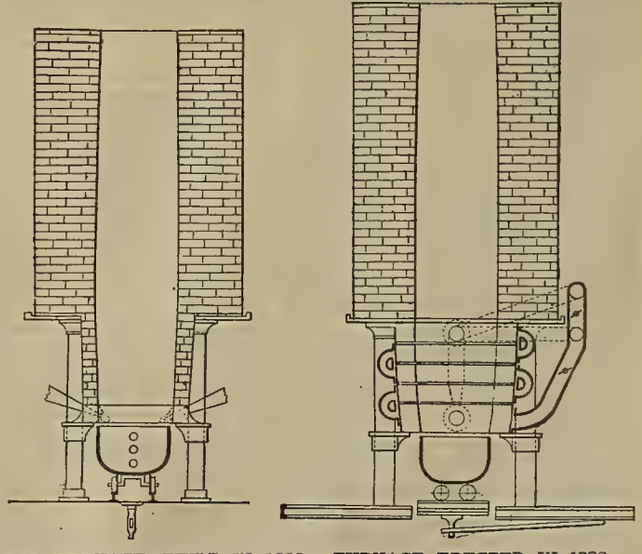
Slime Concentrator.

Miles B. Dodge of this city has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a machine for concentrating slimes, which is shown in an engraving on this page. The slimes from sizing-boxes are taken on to the machine through the trough *a*, into the settling-box *b*. At the bottom of the settling-box is a small pipe to take all the slimes that will settle with just the required amount of water for the good working of the machine. The surplus water flows over the top of the settling-box at each side into a second settling-box *c*, where any slimes that might be still held in suspension will settle and flow out of the small pipe *e*, the water still remaining flowing out through the rubber hose *f*, into the tailing sluice *p*.



It will be seen by this operation that all matter in suspension will settle and leave the surplus water to flow off without coming on to the bed of the machine. In fact, this represents in action the old German rapping tub for settling slimes.

The slimes after being settled out of the surplus water into the spreaders *gg*, from the settling-boxes, are spread evenly across the concentrating bed *k*. The revolving shaft with cam *o*, moves the concentrating bed gently forward, the springs *mm* bringing it suddenly back, striking on buffers which send the gangue and mineral toward the upper end of the machine, where water is turned on in just the most delicate proportion to separate the gangue from the mineral through pipe *i*, having cross pipes with small holes. The water striking the head of the machine, flows gently down the table, separating the gangue from the mineral and carrying the gangue over and off the lower end into the tailing sluice *p*. The mineral passes up toward the head of the machine into a depression which has a raised pipe in it, through which the mineral escapes with water enough to carry it down the small spout *n*, into any kind of receptacle that may be provided. The finest slimes that will not travel against a current of water will settle in a depression at the lower end of the concentrating table, to be removed when it fills up. The machine is regulated by the inclination given with the hand-screws *ss*, and by the amount of water turned on through pipe *i*, and the tension of the springs *mm*. This slime concentrator is sold by Parke & Lacy Co., 21 and 23 Fremont street.



THE DAVIDSON STEAM PUMP.—(See page 53.)

THE Santa Cruz *Sentinel* of Sunday says: Chief Engineer Schussler of the Spring Valley Water Works will to-morrow commence the survey of a route from Laguna creek to this city for the line on which will be laid the main pipe for conducting the waters to the storage reservoirs to be built in Santa Cruz.

DODGE'S SLIME CONCENTRATOR.

MPROVED FURNACE, BUILT IN 1880. FURNACE ERECTED IN 1882.

See page 48.)

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Northern Counties of California.

[NUMBER 6.]

Gold Bluff Beach Mines.

[Written for the PRESS by JAMES H. CROSSMAN.]

Still another evidence of the magnitude and importance of this ancient river system can be seen at Gold Bluff, Humboldt county, latitude 41 north, and longitude 124 west from Greenwich. Here a dead river 6½ miles wide from bank to bank has discharged its contents into the Pacific ocean. This river of the system previously described must have taken a circuitous route to find the great "father of waters." In the absence of a geological survey and accurate maps, it is difficult to trace its true course, though to all appearances it flowed from a northwesterly direction, as gravel can be traced on the surface for 15 miles or more southeasterly from its mouth in the direction of the confluence of the Trinity river with the Klamath at the big bend of the latter. In all probability this dead river formed at some remote period in the earth's history the bed of what is now known as the Klamath river, diverging from it at a point near "the big bend."

The Klamath, though now but an insignificant torrential stream, if we can judge from the numerous side dead river channels that rise from the present river-bed in terrace form on its bank, must have been at some time an immense river, quite large enough to move and carry the enormous amount of alluvions found at Gold Bluff; but this is hypothetical and requires a skilled engineer with a trained corps of assistants to determine. Whatever the course or origin of this ancient river may have been, there can be no question as to its character.

A Cross-Section of its Channel,

Exposed by the erosive action of the elements and wave power of the Pacific ocean, shows a well-defined trough of a river-bed measuring from rim to rim 34,320 feet. The rocky banks on either side rise from the ocean level with a gradual and regular slope to a considerable elevation, the northerly the most abrupt, the southerly at a lesser angle of inclination. Both are overlaid on their slopes by alternate strata of alluvions gravel, pipe clay, gravel, sandstone, gravel, cement, etc., in regular order and of varying thickness, dipping into the basin-shape depression until reaching a point near the center, where the upper strata assumes a horizontal position for a considerable distance. This denotes the former existence of a strong current and deep water in the channel's center. The rim rocks of the channel have, from denudation and atmospheric influences, been more rapidly degraded than the gravelly contents of the channel. The latter at one point shows an elevation of 926 feet of solid gravel and river wash (above the ocean level), with nearly vertical cliffs or escarpments varying from 40 to 618 feet in hight, cut and exposed longitudinally for considerable distances by water-courses. This stratum, as it lays on and above the rim rock, if projected on the same angle of inclination downward below the ocean level, would indicate a depth of gravel of 2700 feet, to which add the fluviatile material seen above, and we have 3636 feet of auriferous material—the strata are composed of the same material and are of the same character as that found in the pliocene channels of the most noted hydraulic mines of our State. The metallic and mineralized products are the same, and fossil and carbonized woods are not wanting; gold osmioridium, precious stones, etc., are also found. The undoubted evidence of the existence of river wash at so great a depth

Below the Ocean Level

Indicates a gradual but slow subsidence of the earth's crust through long periods of time.

There are also indications that the mouth of this Amazonian river at one time extended much farther out into what is now the ocean than at present, as evidenced by the sharp, rocky projections that once formed the rim of the channel appearing in their appropriate places above the ocean level. The present headlands and crescent-shape formation of the bluffs represents the mouth of the river that was.

The enormous mass of fluviatile material that filled the frontage of this channel has, in process of time, been degraded by atmospheric influences and hydraulic agencies which are and ever have been at work tearing down and building up. In this instance the waves of the ocean, assisted by atmospheric influences, have been the destroying element. The erosive power of water in motion is great; its impact, as it impinges on any obstruction, rocky bluff, or gravelly bank, equals in a moderate swell 611 pounds to the square foot; in an ordinary storm, 2,086 pounds; and when lashed into fury by a severe gale or hurricane the blow equals 6000 pounds; hence the result.

During the Periodical Storms

Of the winter months volumes of water are dashed against these beetling, gravelly cliffs, with an irresistible force accompanied by a deafening report, undermining and shattering the mass until the projecting and overhanging cliffs can no longer sustain their weight. Their cohesive power exhausted, thousands of tons are detached, cave and fall and seek the ocean level. The incoming wave destroys its integrity and further pulverizes the mass; the receding wave, with its undertow, carries the earthy and lighter material seaward, leaving but a small portion of its metallic contents on the gently sloping sandy beach, gilding its surface with a golden sheen.

This has been the result of the operations of Dame Nature's Big Giant and hydraulic apparatus. It is this that has given pith and moment to that industry known as the

Gold Bluff Beach Washings,

Inaugurated in 1851 by General James Wilson, and worked successfully with a primitive process by him and his successors in interest to date with an output in excess of $1,000,000 in gold values, which has contributed to the circulating medium of the world. Recently a new element has appeared to destroy the integrity of this mountain of auriferous gravel—man with his "Little Giant," using water under a powerful pressure head, has also commenced the work of destruction.

A son of Edson Adams (deceased) is now working the property known as the Pioneer claim—a portion of Gold Bluff—by the hydraulic process with marked success. The gravels of this channel have proved to be remarkably rich. With the Pacific ocean for a dumping-ground, and no disgruntled or belligerent anti-debrisities to object, no federal or State court to enjoin, and gravel enough in sight to build and ballast a railroad to China, with a sufficiency of the precious metal in the gravel to pay the national debts of the world, his success seems to be assured.

The Bluff proper, which comprises the mouth of this dead river, contains in its frontage on the Pacific ocean two claims, known as the "Pioneer" and the "Union"; the former is owned by the estate of Edson Adams; the latter by Chapman & Co. of Arcata, Humboldt Co.

The Tuolumne County Mines.

Soulsbyville.

EDITORS PRESS:—Soulsbyville is one of the most prosperous mining districts in the State, and contains more paying mines for its area than any other camp I know of, although the formation is granite (gray) and gneiss or foliated granite. The old Soulsby mine has produced its millions of dollars during the past 35 years, and I have good reason to believe, and know, that with capital to develop the rich chutes to further depths, and to explore the unopened portions of the old mine, millions may yet be extracted. The old mine has not been allowed to decay, but is kept in working order. Powerful pumps are kept running under water-power, and everything done by Mr. Wm. Sharwood, the owner, to preserve the property. Although the ground is hard, it is a cheap mine to work, notwithstanding the contrary being said, for the mine requires little or no *timber* to keep it open. This is the main cost in all mining operations, the latter having to be so often renewed from decay and pressure. Lastly, the risk of fire getting into old mines, that are closely timbered, is a fearful cost when necessity demands its use and renewal. In the case of the old Soulsby, timber is not needed to any extent except for platforms, stations and the like.

The mine is opened to a vertical depth of over 600 feet, and eight levels with almost miles of drifts, crosscuts and tunnels. The vein is not large, but of high grade; value, from $20 to $60 per ton. In places the lode has produced several hundreds per ton, and, as I said before, capital is only needed to make this once-famous mine boom again.

Next to this mine is the Platt and Gibson mine south. They have expended considerable money in hoisting works and mill. The owners are perfectly satisfied with their outlook and are slowly and surely developing their property to the best advantage, with a safe result in the future of a dividend-paying mine. It is the south extension of the Soulsbyville vein.

Proceeding back north on the west side of the Soulsby mine we find the Wheal Perrin. This is an exceedingly rich mine, so far as opened. The south shaft, 128 feet in depth, sunk on the vein (which is nearly vertical 80° slightly dipping to east strikes nearly north and south it parallels the Soulsby) is opened by drift and stope (north). Gold can be seen along the entire workings. The ore has paid in mill $64 to $70 per ton. But the great richness is found in the base metals, which consist of galena, zinc, blende and chalcopyrite. The richest base is a peculiar pyrite, of green color, in uniform masses of acicular crystals. No gold can be seen in them, as extracted from the mine, but I have worked several pounds of this class of sulphurets up to $2000 per ton (or at the rate of); these are facts. The vein is small in places and pinches when the walls make a bend or turn, but will average eight inches in places at the bottom of south shaft. The rock will work 50 cents a pound in free gold. The whole of the soft, decomposed vein to 30 feet from grass paid $30 per ton. At that depth the vein enters the hard granite and is pinched from 2 feet to 8 to 18 inches in width; in places on a turn of the walls to 4 inches. The chute is 200 feet long, as developments show. The vein is seated in gneiss, and gold can be seen in this black granite, the quartz being frozen to the slating in places. The value or what is asked for the property is in sight, and can be easily extracted. This is a very safe computation; 200 feet from No. 1 or south shaft is No. 2 north sunk only 30 feet, and the interim space between the two shafts yielded $30 per ton. Hence the distance of the length of chute was determined, viz., 200 feet.

The mine is held under United States mineral patent, title perfect. I may here state, there is no mine in this section that I would rather own than the Wheal Perrin, for a safe and sure investment. At first sight it does not impress the stranger. A man must be almost educated to the knowledge of this very peculiar ore. I will guarantee the oftener the expert tries, assays, and works the rock, the more he will be satisfied with its great value. It is a cheap mine to work, with the right kind of men at its head. He or they must have a good sound metallurgical and mineralogical knowledge to successfully treat its ore. There is no great difficulty in the way to such a man; his success will be triumphant. It is like the Soulsby mine in this respect, but little timber is required. Of course, the granite is hard to drill, but blasts kindly. A small stope is only needed to extract the vein, and being nearly *vertical*, a small stope can be easily worked with a few stull pieces to carry staging.

Next south to the W. P. is the Churchill, also a mine of merit, but which has been neglected of late. Here is a good chance for anyone desiring a cheap mine on this line, being on the same vein as Wheal Perrin, also a parallel to the Soulsby vein.

Still further south, on the same line, are found the Black Oak, Carrie, and Live Oak. The Black Oak is steadily working with a large force of men, and their ten-stamp mill pounding away on 30 to 40 dollar rock, besides their concentrates from their Frue vanners, running up into the hundreds per ton. The vein averages two feet and in places five feet. They are working most systematically, and own a magnificent property. The Carrie mine shows the same high-grade ore, as well as the Live Oak adjoining. Time will surely develop these other mines, equal to their neighbor, the Black Oak.

Still further to the west another parallel is found in a vein known as the Drapery mine. It has been stoped from water level to the surface. The rock averaged $70 per ton. It is now bonded, awaiting new owners, who will energetically open up its riches. A great amount of money was taken out of this mine, and its future is assured, for the last rock milled paid handsomely. Litigation caused its closing down. ARGUS.

In the Blue Mountains, Oregon.

EDITORS PRESS:—Thinking some mining items might interest the readers of the PRESS, I thought I would send you a few. This place is situated on a tributary stream to the middle fork of the John Day river, in one of the best mining regions of the Blue mountains. The ore of the camp is all free-milling, but after depth is attained and the water level is struck the ore becomes sulphureted. After the depth of 75 or 80 feet the free gold disappears. The sulphurets are immensely rich. Out of four assays at the U. S. assay office at Boise City, Idaho, the net returns were 27 ounces in gold and 15 ounces in silver per ton. The ledges are large and well defined. The formation is talc-slate. The country is finely situated for a mining region, but if they do not start in pretty soon and commence to take out some money, I am afraid the community will commence to lose confidence in the Blue Mountain range as a mineral-producing country. PHIL. REILLY.

Susville, Grant, Oregon.

The Montezuma Wells.

Probably one of the most interesting relics of the prehistoric race that densely populated central Arizona is the Montezuma wells, on Beaver creek, 13 miles northeast of Camp Verde. The buried cities and ruins of the Salt River valley are of more interest to the historian and day-dreamer, but they scarcely equal, in testimony, the large quantities of broken pottery that mark the sites of our populous districts on the mesas 10 or 15 miles beyond the water carried by the most advanced of our modern irrigating ditches. But the Montezuma wells call for less exertion of imagination. An almost circular hill that would not cover a 40-acre field rises to the hight of about 100 feet on the north bank of Beaver creek. At the top is a perfectly round hole, probably 300 feet in diameter, with perpendicular walls of about 50 feet that descend to a body of clear water that assumes a black hue as you look down into its unfathomable depths—absolutely unfathomable, because bubbles come up for an hour from descending stones that visitors throw into its depths. An opening, whether artificial or natural is unknown, permits the surplus water to run out under a natural bridge 40 feet wide into the creek or a modern irrigating ditch which a utilitarian has led over a lovely little homestead, thus securing an unvarying water supply. In the perpendicular walls are houses of stone built by that mysterious people of whose history we know nothing, that prehistoric race that has left no posterity. On the top of the bridge between the wells and the crater are remains of demolished forts or houses of more massive structure than those that indent the walls. The wells are of volcanic origin and the water is a trifle warm. There are probably hundreds—perhaps thousands—of square miles in a body in Arizona in the great unknown region beyond the grand canyon upon which no white man has set foot. What are its mysteries?—*Phœnix Herald.*

Mineral Products of the United States.

The sixth report on "The Mineral Resources of the United States," by David T. Day, Chief of the Division of Mining Statistics and Technology, United States Geological Survey, is to be issued shortly. This report is for the calendar year 1888, and contains detailed statistics for this period, and also for preceding years, together with much descriptive and technical matter. The following are the totals of the production of the more important mineral substances in 1888:

Metals.

Iron and Steel.—The principal statistics for 1888 were: Domestic iron ore consumed, about 12,060,000 long tons; value at mines, $28,944,000. This is an increase over 1887 in quantity of 760,000 tons, but a decrease in value of $4,956,000. Imported iron ore consumed, 587,470 long tons; total iron ore consumed in 1888, about 12,650,000 long tons, or 150,000 tons more than in 1887. Pig iron made in 1888, 6,489,738 long tons; value at furnace, $107,000,000. This is an increase over 1887 of 72,590 tons in quantity, but a decrease of $14,925,800 in value. Steel of all kinds produced in 1888, 2,899,440 long tons; value at works, $89,000,000. This is a decrease from 1887 of 439,631 tons in quantity and of $14,811,000 in value. Total spot value of all iron and steel made in 1888, in the first stage of manufacture, excluding all duplications, $145,000,000, a decrease of $26,103,000 as compared with 1887. Limestone used as a flux in the manufacture of pig iron in 1888, about 5,438,000 long tons; value at quarry, about $2,719,000.

Gold and Silver.—According to the Director of the Mint, the gold product was 1,604,927 fine ounces, valued at $33,175,000. This is about the same as in 1887, being an excess of only $75,000. The silver product was 45,783,632 fine ounces, of the commercial value of about $43,000,000, and of the coining value of $59,195,000. This is an increase of 4,515,327 ounces over the product in 1887. In addition to the product of our own mines some 10,000,000 ounces of silver were extracted in the United States from foreign ores and bullion.

Copper.—The total product, including the yield of imported ores, increased to 231,270,622 pounds, or 115,635 short tons, during 1888, which is 46,053,291 pounds more than the product of 1887. During the first quarter of 1889 the production was increasing at even a more rapid rate. The prices received by American producers averaged 15½ cents per pound for Lake copper, 14½ for Arizona, and 14 for other districts, making the total value $33,833,954. Montana led in the production, making 97,897,968 pounds. Consumption was somewhat reduced by the high prices.

Lead.—The product increased to 180,555 short tons from 160,700 tons in 1887. The increase was due principally to the heavier receipts of lead in Mexican silver-lead ores from 15,000 tons in 1887 to over 27,000 tons in 1888. The average price in New York was 4 41 cents per pound. The production of white lead, chiefly from pig lead, was 89,000 short tons, valued at $10,680,000.

Zinc.—The erection of new works and the extension of old ones led to a further notable increase in the production of zinc in 1888. The additions to capacity were fairly uniformly distributed in the West, East and South. Production in 1888, 55,903 short tons, with a total value of $5,500,855; in 1887, 50,340 tons, worth $4,782,300. The production of zinc white in 1888, directly from ores, was 20,000 short tons, worth $1,600,000.

Quicksilver.—The product was 33,250 flasks (of 76½ pounds each) from California, a decline in that State of 510 flasks from 1887 in spite of a very satisfactory price, which averaged $42.50 per flask, making the total value $1,413,125. No new valuable deposits were discovered in 1888, and without them it is not probable that the yield of quicksilver will increase.

Nickel.—The industry remains unchanged except for indications of further developments at Lovelock in Nevada and Riddle, Oregon. The product includes 190,637 pounds of metallic nickel, valued at $114,382 at 60 cents per pound, and 4545 pounds, worth $1136, exported in ores and matte. Total value, $115,518. The corresponding value in 1887 was $133,200.

Cobalt Oxide.—The total product, including the contents of the exported ore and matte, was 12,266 pounds, worth $18 441. In 1887 the total was 18,340 pounds, worth $18,774, the lower rate of value in that year resulting from a larger proportion of exported nickel in matte and ore. The price of cobalt oxide remained at $2 per pound.

Chromium.—The product declined from 3000 tons in 1887 to 1500 tons in 1888. The average price in San Francisco remained $15 per ton. Increased operations are probable in 1889.

Manganese.—The product of manganese and manganiferous iron ores in the United States in 1888 was 239,460 tons, valued at $876,215. Of this amount some 25,500 tons would be classed as manganese ores; the remainder as manganiferous iron ores. Of the manganiferous iron ores 11,462 tons, averaging 11 per cent of manganese, and 189,544 tons, averaging four per cent of manganese, were from the Colby mine, Michigan. In addition to the above, some 60,000 tons of argentiferous manganese ores, valved at $10 a ton, chiefly for the silver contained in them, were produced in the Rocky mountain region.

Aluminum.—The past year was more promising than ever before for the production of

cheap aluminum. The production of metallic aluminum as an industry distinct from the production of alloys began toward the close of the year, and 500 pounds had been made up to December 31; the production of 3000 pounds since then indicates that the industry may continue. The exact amount of alloys produced by the Cowles process has not been furnished, but was not markedly different from the product of 1887, when 18,000 pounds of aluminum contained in bronze and ferro aluminum were produced. The price for metallic aluminum declined to as low as $4.50 per pound for less favored brands.

Platinum. — Including the platinum and ridium separated from gold by the assay offices and that saved in placer gold mining, the product was about 500 ounces, valued at $2000.

Fuels.

Coal.—The total production of all kinds of commercial coal in 1888 was 142,037,735 short tons (increase over 1887, 18,022,480 tons), valued at the mines at $204,221,990 (increase, $30,625,994). This may be divided into Pennsylvania anthracite 43,922,897 short tons (increase, 4,416,642 short tons), or 39,216,872 long tons, including 38,145,718 long tons shipped by the railroads and canals and reported by their statistician, Mr. John H. Jones, and 1,071,154 long tons sold to the local trade at the mines (increase, 3,943,430 long tons), valued at $85,649,649 (increase, $6,284,405); all other coals, including bituminous, brown coal, lignite, small lots of anthracite produced in Colorado and Arkansas, and 4,000 tons of graphitic coal mined in Rhode Island, amounting in the aggregate to 98,114,838 short tons (increase, 13,605,838), valued at $118,572,341 (increase, $24,241,589).

The colliery consumption at the individual mines varies from nothing to eight per cent of the total output of the mines, being greatest at special Pennsylvania anthracite mines and lowest at those bituminous mines where the coal bed lies nearly horizontal, and where no steam-power or ventilating furnaces are used. The averages for the different States vary from 2 to 6.4 per cent, the minimum average being in the Pennsylvania bituminous and the maximum average being in the Pennsylvania anthracite region.

The total output of the mines, including colliery consumption, was: Pennsylvania anthracite 41,624,610 long tons (increase over 1887, 4,045,863 long tons), or 46,619,564 short tons (increase 4,531,367 shorts); all other coals, 102,039,838 short tons (increase 14,152,478 tons), making the total output of all coals from mines in the United States, exclusive of slack coal thrown on the dumps, 148,659,402 short tons (increase, 18,683,845 tons), valued as follows: Anthracite $89,020,483 (increase, $4,468,302); bituminous, $122,497,341 (increase, $24,492,685); total value $211,517,824 (increase, $28,960,987). The above figures show a notable increase in 1888 over 1887 in the aggregate output and value of both anthracite and bituminous coal, although not as great an increase as occurred in 1887 over 1886 in the value of the anthracite, or in the total tonnage of the bituminous coal.

Coke.—The production of coke in the United States in 1888 was 8,527,560 tons, valued at about $14,000,000. Pennsylvania produced by far the largest amount, the Connellsville region alone producing 4,955,553 tons; West Virginia, 528,533 tons; Alabama, 518,511 tons; Tennessee, 385,693 tons, and Virginia, 149,099 tons.

Petroleum.—The product of petroleum in the United States in 1888 was 27,346,018 barrels (of 42 gallons each), valued at about $24,598,559. Of this amount Pennsylvania produced 16,491,083 barrels; Ohio, 10,010,868 barrels; West Virginia, 119,448 barrels; California, 704,619 barrels; and other States 20,000 barrels.

Natural Gas.—The amount of natural gas consumed is given in coal displacement; that is, the amount of coal displaced by the use of natural gas. It is estimated that the amount of coal displaced by natural gas in the United States in 1888 was 14,163,830 tons, valued at $22,662,128. Of this amount 12,543,830 tons were displaced in Pennsylvania; 750,000 tons in Ohio; and 660,000 tons in Indiana.

Structural Materials.

Building Stone.—Direct returns from producers of the various kinds of building stone show that there was but a small gain in value over the figures of 1887. The value of the stone produced in 1888 is $25,500,000, or $500,000 more than in the preceding year.

Brick and Tile.—Value, $48,213,000. This figure represents only a small gain over 1887. This is due rather to increase in the number of manufacturing plants than to increased production at the older and more important sources of supply; in fact, many of the latter show a falling off in production. Prices also were generally somewhat lower than in 1887.

Lime.—The production is estimated at 49,087,000 barrels, with an average value of 50 cents per barrel, making a total of $24,543,500 as the value of the year's product. These figures are not largely in advance of those for 1887, and the gains are not so much the results of increased production in the leading lime regions as in localities of minor importance.

Cement.—The amount of cement produced in 1888 is less than for 1887, being 6,253,295 barrels for 1888, valued at 72½ cents per barrel, making $4,533,639 as the value of the year's product.

Abrasive Materials.

Buhrstones.—The product which is used for grinding cement, plaster, paints, feed, etc., comes from New York, Pennsylvania and North Carolina, and is valued at $150,000.

Grindstones. — Ohio and Michigan furnish practically all the sandstone from which grindstones are made. The product in 1888 increased slightly, 41,000 long tons, worth $281,800, being produced, against 37,400, worth $224,400 in 1887. The price varied from $6 50 to $10 per ton at the quarries before being finished into grindstones.

Corundum.—Production is limited to the old mines in North Carolina and Georgia; 589 short tons, valued at $91,620, were produced in 1888, against 600 tons in 1887.

Oilstones and Whetstones.—The production of novaculite from Arkansas increased slightly, making the total, including Labrador oilstone, etc., 1,500,000 pounds, valued at $18,000 in the rough state.

Miscellaneous.

Precious Stones.—No systematic mining was carried on in search of gems in 1888, but in mining for other substances and in chance discoveries, gems worth $64,850 in the rough state, and gold quartz worth $75,000, were found.

Phosphate Rock.—The production declined to 433,705 long tons, but the total value increased slightly to $1,951,673 on account of better prices. The trade in manufactured fertilizers was very prosperous.

Marls.—The production in the Southern States, particularly in Virginia, North Carolina, Alabama, Mississippi and Florida, is increasing, while the product of New Jersey did not vary from 1887. About 600,000 tons, valued at $300,000, were produced.

Salt. — The industry shows only slight changes. In 1888 the production was 8,055,881 barrels of 280 pounds, valued at $4,377,204. In 1887 the product was 8,003,962 barrels, worth $4,093,846. Kansas became a commercial source of salt in 1888, producing 155,000 barrels, with a prospect of still greater increase in 1889.

Bromine.—The product was 307,386 pounds, worth $95,290, an increase from 199,087 pounds in 1887, worth $61,717. The price remained at 31 cents per pound.

Borax.—The production was restricted to 7,589,000 pounds, worth $455,340, at six cents per pound for the average quality. In 1887 the product was 11,000,000 pounds, worth five cents per pound.

Sulphur.—The sulphur refinery in Utah was partially burned. This and litigation over the property prevented any production in 1888. The supply came principally from Sicily, with small importations from Japan. It was practically all made into sulphuric acid.

Pyrites.—Production 54,331 long tons, valued at the mines at $167,658—a slight increase in quantity over the previous year.

Barytes.—The production from Missouri, Virginia and New York increased to 20,000 long tons, worth at the mines $110,000; in 1887 the product was 15,000 long tons, worth $75,000.

Gypsum.—The domestic supply comes principally from Ohio and Michigan, with smaller amounts from New York, Virginia, Kansas, Colorado, California, Dakota and Utah. The product in 1888 was 96,000 short tons of crude gypsum, valued at $430,000. A large portion of the supply is imported from Nova Scotia, where 126,118 tons, worth $121,579, were produced in 1888.

Ozocerite.—From the region of Soldier's Summit, Utah, about 20,000 pounds of crude mineral wax were produced, worth $1000 in New York, where the material was sold. An increase is probable in 1889.

Soapstone. — Production about 15,000 tons, worth $50,000 before shipment.

Asphaltum.—The product of 1888 includes 700 tons of gilsonite mined in Utah; 3100 tons of ordinary asphaltum, principally from California, and 50,000 tons of bituminous rock quarried in California for pavements in competition with asphaltum; total value, $331,500.

Feldspar.—The consumption for potters' use declined to 8700 long tons, worth, in Trenton, New Jersey, $50,000. In 1887, 10,200 long tons were produced, worth $56,100.

Flint.—For potters' use the consumption was 16,250 long tons. Including that for sandpaper and for glass, the consumption was about 30,000 tons, worth, unground, $175,000.

Potters' Clay.—The consumption included 18,000 long tons of kaolin or china clay, 5250 tons of ball clay, and 13,500 tons of fireclay, worth altogether $300,000.

Mica. — Owing principally to the use of smaller sizes in stoves, the production of sheet mica decreased from 70,500 pounds in 1887 to 48,000 in 1888, valued at $70,000. There is increased demand for mica waste.

Mineral Paints.—The product, including ocher, metallic paints and small amounts of umber and sienna, increased to 24,000 long tons, valued at $380,000.

Graphite.—The production of pure graphite was limited to Ticonderoga, New York, and is reported as unchanged. The total production of pure material was 400,000 pounds, worth $33,000. Small amounts of less pure material for foundry facings, etc., were produced in North Carolina and at Cranston, Rhode Island.

Fluorspar.—The production, limited to the neighborhood of Rosedare, Illinois, and Evansville, Indiana, is reported at 6000 tons, worth $30,000, an increase of 1000 tons over 1887.

Infusorial Earth.—The product came principally from Maryland, and amounted to 2500 short tons, worth, before shipment, $12,500.

Zircon.—During 1887 and 1888, 25 tons of zircon were mined, principally in Henderson county, North Carolina, and sold for $10,000 for the manufacture of incandescent gas-burners. About four tons of monazite, one ton of allanite, 600 pounds of samarskite, and $500 worth of yttrium minerals were produced for the same use. About six tons of monazite and five tons of cerite were also imported.

Mineral Waters.—Amount sold in 1888, 9,628,568 gallons, valued at $1,709,302. In 1887 the product was 8,259,609 gallons, worth $1,261,473.

Totals.—The total value of the minerals produced in 1888 was $591,659,931. It is recognized that this is the sum of the values of substances taken in various stages of manufacture, and hence not strictly comparable with each other; still it is the most valuable means for comparing the total products of different years. The result is an increase of nearly $50,000,000 beyond the value of the product in 1887. In that year nearly every mineral industry showed an increase, and hence an increased total was evident. But the fact that the increase was so very large was due to rather exceptional conditions in a few important industries, and it could not reasonably be expected that a similar combination of circumstances would result in even a larger total value for 1888. Nevertheless the unprecedented stimulus given to the production of copper by an artificial price increased the total value of that product $13,000,000, or nearly enough to offset the decline in the total value of pig iron. The other important factors in the increase were coal and the other fuels which followed the increased quantity of metals. With the anticipated decline of copper to the normal demand, a decline in the total value of the product in 1889 will not be inconsistent with the natural development of our mineral resources.

THE GREAT EIFFEL TOWER AT THE PARIS EXPOSITION OF 1889.

The Eiffel Tower.

The most conspicuous object at the Paris World's Fair, which is now in progress, is the Eiffel tower, shown in the engraving on this page, for which we are indebted to the California *Architect.* The tower rises to a hight of 984 feet, and above that is the lightning conductor, so that the air is pierced by the structure to a hight of a round thousand feet. This is one of the most wonderful constructions the world has ever seen, and the altitude attained by such a network shows what great progress has been made in modern times concerning the strength of materials.

The tower rests on four independent foundations, each standing at one angle of a square about 330 feet on a side. The foundations reach to a depth of about 50 feet below the surface. As the engraving shows, the tower essentially consists of four great curved columns, independent of each other, and connected together only by belts of girders at the different stories, until the columns unite toward the top of the tower, where they are connected by ordinary bracing. Iron, and not steel, was used in the construction of the tower throughout. The total weight of the wrought and cast iron that has been used in this unique tower is 7300 tons, not including that used in foundations or machinery. The number of pieces of iron of different forms is 12,000. The tower is painted a rich chocolate color, the tone of which is lightened toward the summit.

The tower is a marvel to one who gazes from below at its sky-penetrating altitude, or views it from afar rising above the exposition buildings and adjacent structures, or catches by night the gleam of its electric lantern. Provision is made by which visitors are lifted to the top by elevators to view the vast landscape which is commanded from such a hight.

The tower is a credit to its designer and builder, M. Eiffel, and to the French people.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CONSOLIDATED.—*Ledger*, July 13: Forty stamps only of the Pacific mill are kept running, and there do not appear any prospects of any more being started at present. There is something inexplicable about the working of this great mine since the fire, and numerous conjectures are indulged in to account for the methods adopted. At the time of the fire, or immediately thereafter, reports were afloat that the disaster was being used by insiders for stock-jobbing purposes to depreciate stock in the New York market. The stock fell from $20 to $8 and $9. When the property was reopened it was thought that the stock would soon mount to something like the old-time figures. With 40 stamps in operation the output for the three months ending May 1st, amounted to nearly $48,000, an average of $16,000 per month, which is at least $8000 per month over running expenses. This is certainly very satisfactory as far as it goes. Still the stock does not rally, as it ought to, if the outlook was favorable for the gold production to approach to ante-fire days. The impression is still strong with outside stockholders in New York that the stock manipulators are still at work for some object not well understood except by those who are in the scheme. That the ore is of good average grade is evident from the product of the 40 stamps. It is not so rich as in the best days of the property when $80,000 to $90,000 per month was the output of the 160 stamps. An agreement has been placed on record by which Eli Gardner and wife give immediate possession of the old Paugh mine to Robert Stevenson, for mining purposes, upon the deposit of $2000 with Wells, Fargo & Co. in San Francisco, for the practical working and development of said mine.

DRYTOWN CON.—*Dispatch*, July 12: The shaft on this property has been sunk 25 feet on the proposed 200 feet. They started sinking about three weeks ago, and have been doing good work for four men. Considering the time lost by breakages of water wheel, ditch and other delays, it is expected that they can sink 12½ feet per week in the future. The ore body is swelling into the shaft, has come in two feet in the 25 feet sunk. A piece of the ledge was broken off a few days ago that showed free gold. It is the intention to cut the ledge at the 400 and see what kind of ore they have and how large a body it is.

COSMOPOLITAN.—The shaft is down 600 feet and are still sinking; the raise from the 300-foot level was broken through to the 200 level last week; the tunnels north on the 300 and 400 are being pushed with all possible speed. The lumber for their mill will be delivered as fast as possible now, by Allen & Culbert; the first load was unloaded on Monday; it is all sawed and ready for hauling from the sawmill. In 90 days they expect to be crushing ore.

HENRY CLAY.—The Crocker tunnel is in 250 feet and is looking very well; they passed through some very good ore and a large body of ledge formation.

NORTH CALIFORNIA.—It is reported that a party of miners are about to lease this property for one year.

Calaveras.

CENTRAL HILL MINES.—Cor. Angels *Prospect*, July 13: A few days ago I visited Central hill, going first to the Benson claim. They have a good mine and do the work themselves. Five young men full of vim and push have driven a tunnel into a hill 700 feet where they have found a large body of pay dirt. The dirt is hard and they will soon erect a three-stamp mill to crush it. These parties are deserving of a good claim and they now have it. From the Benson's claim I went to that of J. Jackson & Co.'s. Here I found Mr. Hertzig erecting hoisting works. This claim has an engine of 30-horse power now in place, and a shaft 55 feet deep. These parties mean business and are prepared to thoroughly prospect their claim. I next visited Mullen's claim, which years ago was very rich and will be again under the careful management of T. Goodwin. I confidently expect to hear before long of good pay in these mines, as they are worked by miners of brains, experience and muscle, and are men, if successful, who can smile, and if unsuccessful, can meet defeat.

BENSON.—Amador *Dispatch*, July 12: This gravel mine, which is situated in Calaveras county, about seven miles below Mokelumne hill, is working steadily along. We made mention of this property a short time ago when they had just struck the pay dirt. Since then they have taken out about 500 tons, and have found the channel to be 60 feet wide; no timbering is required, as the dirt is hard enough to hold itself up the same as hard rock. A couple of pieces of the gravel were left at Kelly's last Tuesday, which show free gold in considerable quantities. D. Donnelly of Sutter creek will erect a ten-stamp mill on the property.

RICH QUARTZ.—Angels *Monitor*, July 13: Quite a rich deposit of ore has recently been unearthed in Peet or Whittle mine, near Albany Flat. The discovery was made at the 200-foot level. The quartz is of a cream color and contains little if any sulphurets. We were shown some specimens of the rock which, we feel confident, will yield at least $200 a ton, but simply that shown to us.

Del Norte.

QUARTZ DISCOVERY.—Del Norte *Record*, July 12: Judge Murphy on Wednesday showed us some very fine specimens of quartz from a newly discovered ledge on his property at the Bald hills, 11 miles east of this city. The rock is of a low-grade ore and easily milled, and if it will assay $6 per ton it will pay to work it, as there is an abundance of ore in sight to justify putting up a small mill. Mr. Murphy sent below, on the steamer Crescent City yesterday, several hundred pounds of ore which he will have assayed, and it is his intention on the returns to put a crew of men to work the ledge.

Los Angeles.

THE PUENTE OIL WELLS.—Los Angeles *Herald*, July 13: Great developments are being made at the Puente oil wells. Number 12 promises to run from 45 to 50 barrels a day after the "head" is worked off and it settles down to a steady business. Number 14, the last well on the list, is now down 190 feet. It will have to be bored to between 800 and 1000 feet to find oil, if the stratum dips as it is supposed to at the point where the hole is being made. Number 9 has been an excellent well, giving up a good quantity of oil each day since the pumps were set at work in it many months ago. It is down to a depth of 930 feet, and, from its situation in the canyon, it looks as if a better flow might be had at 1100 or 1200 feet. The drills are now at work, sinking the hole to a lower level.

Mono.

BODIE CONS.—*Miner*, July 15: During the past week west crosscut No. 2 from north drift, 1200 level, was advanced 12 feet. East crosscut from north drift, same level, was driven 10 feet. There were employed nine miners, one foreman. Jointly with Mono winze from south drift, 1000 level, was extended nine feet.

MONO.—During the past week west crosscut from south drift, 1200 level, was advanced 19 feet. There were employed six miners, one foreman. Upraise from south drift 1200 level was driven 35 feet.

Nevada.

GOLD POINT MINE.—Grass Valley *Union*, July 11: A shaft is being raised in the Gold Point mine from the level of the tunnel 1500 feet from its mouth. The raise to surface will be 136 feet, and the shaft in two compartments for ladder-way and for hoisting by whim. After this is completed, the shaft will be sunk below the level of the tunnel, and for the present the ore will be raised by whim, the company using one of the steel whims made at the Risdon Iron Works, S. F., which is the best whim in use, light and durable, and capable of working a mine to the depth of 300 feet. The shaft in the Gold Point will be raised through in about ten days. The ledge in the tunnel is now seven feet in thickness, and of good appearance as to quality, and the outlook is favorable for the development of a valuable mine, as with a ledge of this size low-grade ore will yield a handsome profit. The Gold Point location is to the southeast of the Idaho near the south branch of Wolf creek. The work of driving for the ledge was commenced several years ago, but work was suspended for some time until recently, when operations were resumed. The work of development will now be prosecuted diligently, as there is every encouragement to do so. Jas. Bennallack, one of the principal owners, is superintending the work.

UP-COUNTRY MINES.—*Tidings*, July 16: The permanency of the quartz industry in Washington district is established beyond all cavil. The Yuba mine is yielding from $7000 to $10,000 a month over expenses, which aggregate only $3500 per month. Ledge improving in size and quality with depth. The Eagle Bird is looking better than ever before; the Washington mine is paying, and a dozen promising prospects are being put in shape for systematic working.

DELHI QUARTZ MINE.—Grass Valley *Union*, July 16: The Delhi quartz mine, in which Robert McMurray is the principal owner, continues to yield with its customary profitable results. The ledge is very strong, in places 14 feet in thickness. The mine is worked by tunnels, no pumping or hoisting to be done, and the quartz can be milled and mined at $3 per ton.

NORTH BANNER.—Grass Valley *Union*, July 14: Gordon Morgan is down from the North Banner mine and he reports that all the miners of that mine have been laid off except some contractors who are sinking the shaft.

Placer.

DAMASCUS.—Placer *Argus*, July 13: At Damascus they have made an upraise from an east branch of the main channel of Mountain Gate, and are working on the Damascus side with good results. A tunnel has been started at the Gray Eagle. The tunnel will be run from Owl creek to the present shaft, a distance of about 2600 feet. The tunnel is to be 7x7 feet, and run on a grade of one inch to the hundred feet.

RED POINT.—At Red Point the main tunnel is 2100 feet to where they made their upraise and struck the channel. They have suspended present work in the gravel, and are putting in an east branch to the main tunnel, starting from the 1800-foot point, which will extend 800 feet. They are using Burleighs, and are in extremely hard rock at present. They stopped working the gravel June 14th, and cleaned up for the 14 days' run in June about 600 ounces, the gold being worth $18.90 per ounce. From one-half the floor of its dump, taken up last week, over 20 ounces were washed. They get their water supply through a seven-inch pipe-line, 6400 feet in length, from Humbug canyon. During Mr. Hoffman's visit to Paris the mine was paying finely, and Mr. Snyder, the foreman, sent daily cable dispatches reporting the yield, which was something over 50 ounces per day. J. B. Hobson showed us some rich specimens of cement from the Morning Star mine. He says that in two years' time four dividends of 50 cents per share have been paid, and an indebtedness of $10,000 has been canceled; 2000 feet of bedrock tunnels and gangways have been opened; $55,000 cleaned up, and their present tunnel, when completed, will place the mine in a first-class condition for advantageous work. Hon. C. F. Reed has purchased the Drummond mine at Cottage Home, and intends putting up a mill directly. This promises to be one of the richest quartz mines in the State, as specimens Mr. Hobson showed us indicate. The old Linn mine, now the Pioneer, under the control of Fair & Davis, is being well worked and is paying well. The Horman mine near Wisconsin Hill, under the new management, with new mill and appliances, may be expected to be in first-class condition shortly. The Washington mine has been paying at the rate of about $2000 per month for some time.

Plumas.

GOLD QUARTZ.—Plumas *National*, July 13: We were shown some beautiful gold quartz last week from the Moore & Owens mine at Rush creek, near Greenville. Mr. Owens tells us that he has a fine ledge six or seven feet wide, and it will pay $20 to $30 per ton. The ledge is admirably situated for working, as a tunnel can be put in so as to tap it 700 feet below the surface. Greenville district offers a splendid opportunity for capitalists. There are good mines in that great ridge, but it will take capital to develop them. The Megoyn quartz ledge is looking more and more promising. Will Richard tells us that the indications are that it is one of the richest and most extensive mines in the county.

Sierra.

FREE GOLD.—*Mountain Messenger*, July 14: C. C. Smith, J. L. Jones and others, who relocated the Mexican ledge above Downieville about one year ago, have struck a four-foot ledge that prospects plenty of free gold. Goodell has found good paying drift diggings about 1½ miles above Poker Flat, on Cold canyon. After settling with his men, he pockets a weekly dividend of $100.

Siskiyou.

GREENHORN CREEK.—Yreka *Journal*, July 10: We were shown on the 4th of July a number of exceedingly rich specimens of gold quartz from the ledge of the Heckathorn & Wademan, at Greenhorn creek, a couple of miles south of Yreka. The specimens contained more gold than quartz, taken from a rich pocket in the center of the two-foot ledge. This quartz ledge has been paying handsomely by pounding the rock out in a mortar all winter, but the owners soon intend hauling some quartz to the mill on Yreka Flats for crushing. John F. Boyle & Co. of the North Star ledge at the head of Humbug creek, realized $120 a ton from ten tons of quartz crushed just before the 4th of July, and have 50 tons more in the mill to be crushed as soon as the steam engine from below is received to run the mill, the water in Humbug creek being too small a body to run the mill at present. Messrs. O'Dea & Maurer, two enterprising miners from the Calico district of Southern California, have located the old Knapp ledge on the head of Humbug, from which a big haul was made many years ago, and work suspended on account of ledge pinching out. The hands at work in sinking a well for Vance, Churchill & Autenreith, at Yreka creek, to supply water for their places in town, are anxiously watching for prospects in reaching the bedrock, as many sections of Yreka town site have paid as high as a dollar to the pan, if not more.

San Bernardino.

VICTOR.—*Press and Horticulturist*, July 13: S. S. Nowlin, who has been for several weeks inspecting the new mines in which he is interested near Victor in this county, returned Tuesday. He is very enthusiastic over the prospects. Mr. Nowlin says that at the Victor placers they have five men at work, and they have dug to a depth of 50 feet. The first 26 feet down they found gold in every foot of dirt; and a stratum of volcanic ashes was found for the next 14 feet bearing more or less of wire silver. At the depth of 40 feet bones were found in quantities, which Mr. Nowlin says are unlike any bones that he has ever before seen. They are larger than the bones of an ox, and about half an inch thick from the outside to the marrow. The marrow is petrified. Below this they again found a stratum bearing gold, which still continues. He states that they have their sluice-boxes all completed and have begun to work them. There is plenty of pine growing in that section, some of the trees being very large. Mr. Nowlin thinks that the prospects at the Victor mine are that the company has something valuable.

San Diego.

THE STONEWALL MINE.—Cor. *Times*, July 12: The Stonewall is a mining camp only. It has an elevation of 4700 feet, being 200 feet higher than Julian. At present it has a greater appearance of business and activity than any point I have visited, there being about 70 men employed. The nearest to a reliable estimate of the grade of the ore obtainable would put it at about $20 per ton, with an average crushing of about 25 tons per day, or a return of $500 per day. The expenses of the institution are near that amount, and it is safe to say that the net returns just at present are small. There seems to be a feeling of uneasiness on the part of the management from unseen causes, but probably attributable to the uncertainty about the result of the late reported sale of the property. Excavations for the new 20-stamp mill which was to have been put in have ceased and it is uncertain when work will be renewed. Visitors are refused entrance to the mine. The road from Julian to Stonewall is quite rough, but there is some fine scenery among the Cuyamacas and on the desert in the distance, making the trip well worth taking.

PINACATE.—Riverside *Press and Horticulturist*, July 12: D. A. Wheeler returned last Monday from Pinacate, where with several others he has engaged in mining operations. The following persons have formed a company for the purpose of mining in that section: W. S. Sweatt and D. A. Wheeler of Riverside, Dan Johnson, Geo. Hubbard and Jerry Shay of Colton. They have had dug into the mountain a tunnel 125 feet long in order to get rid of the surplus water that they may prospect to better advantage. A very good ledge 2½ feet wide has already developed, and they are of the opinion that the prospects for a rich mine are very flattering. They have bonded the Virginia and three other mines at that point until December 25th, and will work them steadily until then, unless discouraging features previously arise; but if the mines prove to be valuable, the purchase price has been agreed upon and the company will complete the purchase. Mr. Wheeler will go East this week and investigate the different kinds of mining machinery. When he returns it will be decided just what will be used for reducing quartz.

WASHINGTON.—Julian *Sentinel*, July 13: Work on the Washington mine was commenced in earnest Monday morning. The old shaft is to be cleaned out and retimbered, and the work pushed as rapidly as possible to the depth of 150 feet, when crosscutting will commence. Messers. Keener and Dilks have the contract.

THE Helvetia mine is running night and day. The owners are pushing things for all there is in it.

JUST as we go to press we hear that a very rich strike has been made in the Owens mine.

GOLD KING.—We visited the Gold King mine this week and found the boys hard at work developing their fine property. We were shown some very fine ore, which will have to be hauled some eight miles to be milled. They have a group of six mines, which promise to be very rich.

Tuolumne.

MOFFIT'S MINE.—Tuolumne *Independent*, July 13: Work is being pushed on Mr. Moffit's mine in the Tuolumne river, below the bridge. He expects to be able to get to mining about the 1st of Augus., or 15 days earlier than last year. A force of 22 men is now engaged, working on the dam, putting in machinery and pumps. The flume will be ready as soon as the dam is finished, and by that time will carry all the water, as the river is falling fast. Partly new ground will be operated on. The prospects are very favorable for a good season.

NEVADA.

Washoe District.

YELLOW JACKET.—Virginia *Enterprise*, July 13: Shipping to Brunswick mill 100 tons of ore from the levels above the 1200. Everything about the mine is in tip top shape and there is a great deal of prospecting going on all through the mine.

SAVAGE.—On the 400 level the joint west crosscut has revealed the west clay wall of the vein and has been discontinued. Have resumed work in the face of the main west drift from the station, and advanced the same 26 feet. On the 500 level the prospecting drift north from the upraise is advanced 57 feet; the face continues in quartz carrying some good ore. The joint west crosscut on the south boundary has been advanced 20 feet. There is no change to report in the character of the ground. Have discontinued the shipment of ore on account of the stoppage of the mill. Have shipped in bullion on June account $21,855.

BELCHER.—Have stopped the 1100 raise as it arrived at the 1100 level. The 1100 winze is down 36 feet, the bottom showing quartz assaying from $5 to $18 per ton. The 1100 south drift is out 188 feet. Can hear soundings plainly from the 1100 raise in it. The 1200 south drift is out 164 feet. The face is all in quartz, showing spots of ore, but low grade on an average. The 200 west crosscut is out 83 feet in hard rock.

JUSTICE.—The 490 winze is down 67 feet; the bottom shows four feet in width of good ore. The shaft is down 95 feet below the 490 station and is still in very hard rock. No change to note in the stope. Have shipped to the mill during the week 189 tons of ore, average battery assay of which was $23 65.

HALE & NORCROSS.—On account of the stoppage of the mill have had to discontinue taking out ore. Have men on repairs in all parts of the mine where needed; also in retimbering the main working shaft and running prospecting drifts. Have shipped $73,881 in bullion on June account.

OVERMAN.—Have run the mine five days during the week, and extracted 75 tons of ore. Shipped to the Vivian mill 72 tons. At south end of No. 3 stope, at a point 50 feet above the track floor, have extended an incline upraise to the west 20 feet. Material, porphyry and quartz.

CON. IMPERIAL.—The joint Confidence-Challenge-Imperial north drift on the 500 level, corresponding with the 700 level of Imperial, is now in 749 feet from the Yellow Jacket shaft, 21 feet having been added during the same time. The face is in quartz giving low assays.

CHALLENGE CON.—The joint Challenge-Confidence and Imperial north drift on the 500 level is now in a distance of 749 feet from the Yellow Jacket shaft, 21 feet having been added since last report. The face shows quartz giving low assays.

POTOSI.—South lateral drift, 750 level, is out 532 feet; face in porphyry. South lateral drift, 850 level, is out 510 feet; face in quartz and porphyry. West crosscut, 480 feet south of Chollar shaft, 930 level, is out 50 feet; face in porphyry.

CONFIDENCE.—The letter from this mine is the same as that from the Challenge, which is doing work jointly with the Confidence. There is considerable prospecting work going on in both the Challenge and Confidence.

CROWN POINT.—The northwest drift on the 350 level is out 38 feet in soft porphyry, showing stringers of quartz. Have started up the main south drift on the 700 level, which is now out 198 feet from the shaft.

ALPHA.—On the 500 level the west crosscut, 60 feet south of the shaft, is out 50 feet; face in low-grade quartz. The east crosscut south of the line on the 500 level is out 530 feet; face in quartz and porphyry.

NEW YORK.—North lateral drift from the northeast crosscut, 800 level, is out 250 feet. The drift is following the east side of the ledge, where there is a reported improvement in the material encountered.

SEG. BELCHER.—The 1100 raise is now up 170 feet, having advanced 15 feet since last report. Have started an east drift from it on the seventh floor, which is out 18 feet in soft porphyry.

EXCHEQUER.—On the 382 level the west crosscut, 150 feet south of the north line, is out 70 feet; face in quartz of no value. East crosscut, 150 feet south of north line, is out 50 feet; face in porphyry.

CHOLLAR.—The north lateral drift on the 750 level is out 325 feet; face in porphyry with streaks of quartz. North lateral drift 850 level is out 510 feet; face in porphyry.

EAST SIERRA NEVADA.—On the 520 level the east drift from the Sierra Nevada shaft is advanced 734 feet; face in porphyry, with some water coming in.

SCORPION.—On the 520 level the new east drift from the Sierra Nevada shaft is out 734 feet; face in porphyry, with some water.

ANDES.—Sinking winze in quartz of no particular value below the 350 level. Repairing the north lateral drift on the 350 level.

SILVER HILL.—The raise in the southeast drift, 670 feet from the shaft, is up 90 feet; formation porphyry.

BALTIMORE.—Continue to extract ore of good grade from the crosscuts on the 225 and 338 levels.

BULLION.—Running north on the ledge on the 760 level. Now distant from the shaft 175 feet.

ALTA.—Are running the mill steadily, and the mine is yielding the usual quantity of ore.

Ely District.

PURCHASE.—Pioche *Record*, July 12: W. S. Godbe and John Claflin of New York City have concluded the purchase from C. H. Patchen of the Gold, Silver, Currency and Greenback mining claims, paying $8000 therefor. The four claims are situated on Spring mountain, in town here, and include the mines formerly known as the Washington and Creole, the Mazeppa and the Unknown. There is no pay ore in sight in the claims now, but the bodies of ore re-

cently struck on the 1200-foot level of the Yuba lead to the westward and it is thought they will continue through the claims purchased to the Raymond & Ely ground, the black ledge there being of similar quality.

THE YUBA.—The Yuba Mining and Reduction Co. last Wednesday purchased from W. J. Shivers his mining interests on Spring mountain here. The claims are the Deerfoot, Alpha, Idria and Columbia, and join the Yuba mine on the west. They are regarded as good prospects. The amount paid was $2500.

Eureka District.

NEW RATE FOR ORES.—*Sentinel*, July 13: Supt. Gilman informs us that a new rate for the transportation of ores over the E. & P. railroad is in contemplation, and will most probably be adopted at an early day. It is to be based on the grade of the ores shipped. The exact figures have not been determined upon, but the new schedule is likely to run something like this: On exceedingly high-grade ores the present price of $5 per ton; on ores running in the neighborhood of $100 per ton, $4 per ton; on ores of the value of $50 per ton, $3 per ton, and on ores working say $30 per ton, $1 per ton—or the absolute cost of handling them. Of course these figures may be varied a little, but the above illustrates the idea fairly well. The concession is an important one, and is about the best move that has been inaugurated for this camp in its history. We are assured of corresponding reductions by the big roads on ores to Salt Lake. The smelting trust here has ruined all business. It has starved the miners out and the little railroad as well. The community is to be congratulated on the fact that our railroad has determined to make this new departure. It is going to make a strong effort to build up a business in spite of the trust. That it will succeed we have not the slightest doubt. There are millions of tons of ore in this district that will be mined and shipped under the new order of things. It is a pity that this liberal policy had not been inaugurated two years ago before so many good miners were driven out of the camp by the outrageous combination of our local smelters. But the change is better now than never.

THE EUREKA CON.—*Sentinel*, July 13: Pres. Fries of the Eureka Con., accompanied by an insurance adjuster, came up on Thursday's train. Mr. Fries is not certain what will be done until he looks over the ground. The best opinion is that the company must rebuild. There is no other way out of the present difficulties. The company is behind, and there is no way for the shareholders to get out with a dollar except to keep things moving. It is generally believed here that the insurance money will not be pocketed. In self-defense the company must rebuild.

Campbell District.

ORE. — Reese River *Reveille*, July 10: James Campbell returned to Lee Vaughan's ranch to-day and will by horseback return to his mine to-morrow. Bob Crawford hauled the ore from the mine to the Sampling Works for $11 per ton, and though it was low-grade, yet it worked up to the expectations of Mr. Campbell. In a few weeks he will send in another load by Crawford's wagon.

Golconda District.

ADELAIDE COPPER MINE.—*Silver State*, July 13: Three shifts of men are now at work sinking the shaft on the Adelaide copper mine near Golconda. There are steam hoisting works at the shaft, which is now down about 100 feet. When a depth of 30 feet more is attained levels will be opened. The shaft is six feet wide and is all in ore, which assays well in silver as well as copper, and also carries gold.

Tuscarora District.

NORTH COMMONWEALTH.—*Times-Review*, July 12: East crosscut on the 100-foot level extended 18 feet; total length 130 feet; the face shows seams of spar carrying high-grade ore.

NORTH BELLE ISLE.—From the north drift from the bottom of the winze below the 400-foot level, a crosscut has been run to the vein cutting into it four feet, two feet of which is high-grade ore; work has been temporarily suspended at this point to enable the Queen to drive a crosscut, the windlass being unable to handle the dirt from both places at the same time with the water.

GRAND PRIZE.—The stopes show an improvement in both quantity and quality of ore produced during the past week. The concentrator was started up yesterday, is running smoothly and doing good work. Pump for the mine is now in Elko, will arrive here this week and be set up and put in operation as soon as possible.

NEVADA QUEEN.—No. 1 crosscut, 550-foot level, has been advanced 17 feet, cutting into two feet of good ore, assaying from $46 to $360 per ton; have not reached any hanging-wall. Winze from 450-foot level has been sunk eight feet; total 62 feet. The ore has been continuous; assay from the bottom $309 per ton.

BELLE ISLE.—West crosscut from the end of the north drift, 250-foot level, extended 15 feet, passing through a vein nine feet wide giving low assays. North drift, 150-foot level, extended nine feet, showing some vein matter with a little water.

COMMONWEALTH.—The stopes continue to look well; 219 tons of ore have been sent to the mill, average battery assay $119.34 per ton. Bullion shipped on the 8th $12,822 and about $12,500 to ship to-day.

DEL MONTE.—North drift, 100-foot level, extended 10 feet, showing seams of spar carrying iron. East crosscut, No. 1, same level, extended 18 feet; face still in vein.

NAVAJO.—Upraise on the east vein at the south end, 350-foot level, extended eight feet, continuing to show high-grade ore.

Tybo District.

FINE GRADE ORE.—Belmont *Courier*, July 13: There are large quantities of ore in sight in the Dimick mine and the output is of the usual fine grade. Things are looking favorable in this mine for a good summer's work.

ARIZONA.

NOTES. — Mohave *Miner*, July 13: The Flores Consolidated Mining Company have a carload of concentrates at the depot awaiting shipment. Frank L. Smith shipped two carloads of ore to the Rio Grande Smelter at Socorro this week; one car for M. P. Delhanty and the other of small lots from various miners. John Jamison, who is now working the Jamison mine at Layne Springs, says that the chloriders in that district are doing well, and that the Nighthawk is still taking out high-grade ore in quantities. The Moss mine is being worked with a small force of men. About 100 tons of ore has been hauled to the mill at Hardyville and run through the mill. The result is reported as being satisfactory to the manager, Captain C. B. Dahlgren. F. H. Taylor, a Yavapai county miner, who has been here about three months prospecting, has made a rich strike near Wallapai Springs, in the same neighborhood as the Cummings mine, and the Fyntelle is said to be as promising as the Cummings mine. John Hughes and J. Mitchell have made a strike in the Dolphin, located about three miles south of Stockton Hill, which is said to be the richest strike yet made in that district. The ore is black sulphurets, and the pay streak is from two to four inches wide and assays 2600 ounces per ton. M. D. Howell, the manager of the C. O. D. mine, is well pleased with the new bodies of ore recently uncovered in that mine, and believes that they will prove even richer than any former discoveries. A number of additional miners have been added to the force and others will be put at work as soon as the ground is opened and room is made for them. The Sampling Works have been running but two days during the week, and the following lots were run through: C. O. D. mine, 32 tons of higher grade than has been lately shipped. Harvey & Co., lessees on portion of C. O. D., three tons of high-grade ore. Wm. Grant, one and a half tons from vicinity of Hackburry, and several small lots. The assay office is kept busy, and several carloads of ore are on the way to the works from the mines.

DIFFERENT CAMPS.—Prescott *Journal-Miner*, July 3: Work on the Harqua Hala mines has been suspended pending a sale to San Francisco parties. Two of Culver's big teams arrived last night bringing in a little over 40,000 pounds of ore from the Congress mine. Robeson & Foster of Big Bug had worked a 20-ton lot of ore at the sampling works to-day. F. E. Murray, in connection with J. J. Williams of Copper basin, are engaged in developing the Boggs and Hackberry mine on Big Bug, and have 40 men engaged in developing those properties. Work is being pushed day and night. They are at work on three shafts, one of which is 110 feet deep, another 50 feet and the third 25 feet, all of them being in good ore. The Dixie mill on Lynx creek was started up on Saturday, and worked to the satisfaction of its owners. Well-informed mining men are all of the opinion that the outlook is good for increased activity in the mining industry of this county this fall. Much capital is now looking in this direction for investment. The Congress mine will shortly add an electric light to its many other conveniences for mining.

VEKOL.—Florence *Enterprise*, July 13: Mr. Robert Bowen, who was foreman of the Silver King mine continuously from its first workings up to the time the Bonanza Company obtained control of it, several months ago, is one of the most competent and conservative mining men in Arizona. Mr. Bowen recently visited the Vekol camp and inspected the ore bodies of the Vekol and other mines in that vicinity. He says the Vekol is the finest property he has yet seen for poor men to start with upon a sure road to fortune. The irregular ore shoots are in lime, in bunches or chambers more or less connected with small stringers that guide the prospecting unerringly from one body to another. The dip is very irregular, sometimes almost horizontal and sometimes pitching down at a considerable angle. It presents many new features in ore bodies, and the ore heretofore extracted has been taken out cheaply and without the necessity of timbering. The belt in which the ore is found has been opened 300 feet in width and its extreme width has not yet been determined. The Argosy, an adjoining claim, shows the same character of ore and formation, but carries a larger percentage of lead and is therefore not free milling in character. It is one of the most promising properties in that camp.

THE SILVER KING.—When questioned about the present condition of the Silver King mine, Mr. Bowen unhesitatingly expressed his full faith in the ultimate outcome of that favorite property, and thinks that good ore bodies will be developed below the present workings. For the first 250 feet from the surface the ore was badly broken up and was almost worthless; the quartz, spar and porphyry were all mixed up and of little value. Then the ore chambers were encountered and continued down below the 800 level, the huge masses of ore being very wide at the bottom and narrow at the top; in fact, pear-shaped. The deepest winze was in the same broken formation as that found near the surface, and he believes it will again open out fully as rich as above. The valuable ore so far found has been confined to an area of about 125 by 300 feet.

A BIG MINING SECTION.—Mr. Bowen regards the mineral belt that embraces the Mineral Hill and Mineral Creek sections as the greatest and most extensive of any in the Territory. A great deal of the ore is low-grade and its character so varied that large works capable of treating in quantity every class of ore will be required. Rail transportation will be indispensable, and a north and south railroad that will skirt the foothills along Mineral Hill and the river by way of Riverside will speedily develop several great mining camps.

THE GREAT EASTERN is another fine mine, with very good appearing ore. Considerable work has been done upon this property. The ore is of a character similar to that in the Argosy and Vekol.

BRITISH COLUMBIA.

OKANAGAN CAMP.—Kamloops *Sentinel*, July 9: This camp is situated about 16 miles from Osoyoos lake and about 18 miles north of the boundary line. From Mr. M. McMillan, who has just returned from the camp, we learn there are about 30 men at work, but matters are rather slow at present. There are 13 claims in the camp on which development work is being done, and all show well and promise good returns when the veins are properly opened. The owners of the Wide West claim recently refused $75,000 for the property. The latest and best strike in the camp is on the Brown Bear claim, owned by Geo. Wilkinson and others. It shows more free gold than any other claim in the camp, and will doubtless be the means of drawing the attention of capitalists to these claims. The camp is easy of access, a good pack trail now being open to it, and an excellent wagon-road can be opened up with little expense, it being necessary to build only about 1½ miles of road, with very few obstacles to overcome. The camp is distant from Pendicton, at the foot of Okanagan lake, about 20 miles. Mr. McMillan also visited the new diggings on Siwash creek near Vernon. He reports about 70 men on the creek, and great excitement. The gold taken out is coarse, and all the miners report good pay. There is considerable excitement owing to the action of the Indians, who have pulled up the claim stakes and destroyed the notices posted on the reservation by the whites, and have driven the whites off altogether. The Indians are working the creek themselves, where it runs through the reserve, and are taking out good pay, according to the report of Mr. McMillan, who was standing by while a clean-up was made. He gives it as his opinion that the creek is rich, and as it is easy to work, a large amount of pay will be taken out. It is reported that John Merritt has struck it rich on Cherry creek. No definite information is to hand, however.

COLORADO.

STOPING.—Georgetown *Courier*, July 11: Stoping is going on in the Atlantis, an extension of the Johnson, and good ore is coming out. The Mohawk Tunnel and Mining Co. of Clear creek county is the name of a recent incorporation. Mr. J. B. Johnson has leased the entire available ground in the Paymaster for a year. About 22 men are employed. Another adit has been started on the Independence farther up the mountain. Adits 1 and 2 are also being extended. O. E. Clark has started up work on the Peruvian. As soon as work is fairly under way the output will probably average ten tons a day. The work of putting in large pipes and an exhaust to more readily clear the Hall tunnel of smoke and gas was completed last week, and work at driving the tunnel resumed on Monday. It is now in nearly 1400 feet. Adits 3 and 5 on the Johnson are being cleaned out preparatory for work. A crosscut is to be driven on No. 5, as it is believed the adit is off the pay vein. Other portions of the mine are turning out an excellent grade of ore. George Mills has found that the material he is pitching over the dump in his Banner district mining, contains numerous particles of free gold. A larger engine is to be placed in the Colorado Central mine, and the shaft sunk another hundred feet this summer, which will make its depth 850 feet. The 750-foot level has been driven through nearly 800 feet of mineral, and the stopes run from 10 to 25 feet in width. It is reported that the purchasers of the Pelican Dives will put up a working capital as soon as they get the final deed to the property, which will be the latter part of this month. At the present nine men are employed, nearly all of whom have been in the mine for the past 12 years, and couldn't be driven out.

DAKOTA.

DIVIDENDS.—Deadwood *Pioneer*, July 12: For the six months ending June 30th the Homestake paid in dividends $112,500, or 90 cents per share. During the same period the Caledonia paid $48,000, or 48 cents per share. Total paid by both companies, $160,500, or $16,050 per month.

CLARK'S PROCESS.—The perfected roasters, to superintend building which R. D. Clark went to New York last March, arrived at Whitewood a day or two ago. Harry Clark, who came in yesterday, will supervise their erection, probably at the Buxton, where they are to be thoroughly and it is hoped successfully tested. Mr. Clark's confidence in applicability of his process to treatment of Black Hills refractory ores is not shaken one jot. He claims that the catastrophe of March 1st by which reduction works were destroyed alone prevented his demonstrating it a brilliant success. This confidence is shared by a large number in the community. Mr. Clark, so it is stated, proposes to carry out and prove the process if to that end he is compelled to put up a plant here at his own expense.

IDAHO.

FAY TEMPLETON.—Wardner *News*, July 14: About a month ago the Fay Templeton mill and mine were leased to the employes to whom the company was indebted about $1900 when work was stopped in May. They placed one of their own number, Alfred Lamson, in charge of the mill, and began running it on 12-hour shifts. Mr. Lamson is a practical miner, but has had very little experience in milling and knew nothing about a Huntington plant until he took charge of the Fay Templeton. Up to June 27th, the mill was run 264 hours, crushing one ton per hour. Four cleanups were made, the total yield of which was in round numbers $2400. The first cleanup after a run of 60 hours, yielded $713; the second, 84 hours, brought $800; the third, $515; and the fourth, the remainder. There were 14 men on the pay-roll until the last run, when the number was reduced to ten. All were paid regular wages, and $600 were applied on back pay; this, too, in spite of many disadvantages under the circumstances. It would certainly seem that under the management of practical and economical men, the Fay Templeton property should pay a good margin of profit.

BONDED.—Dan O'Brien, the old-timer of the north side, who has been in Wardner during the week, has bonded the Bismarck group of mines near Murray for an Eastern syndicate through the interest of Major Hopkins. The Bismarck is considered a valuable property, and much development work has been done upon it during the last three years. It is said that the consideration of the bond is $100,000. It is hoped the sale will be consummated, as we know of no men who could bear good fortune better than Messrs. Horn, Meyerenthol & O'Brien.

NEW MEXICO.

PINOS ALTOS.—Silver City *Enterprise*, July 13: The First Luck, belonging to Peter Kness, is showing up well. The new find on the El Dorado, No. 2, is developing handsomely. The pay streak is 15 inches in width, and is improving in depth. The arastras just completed will soon be set in motion and the ore thoroughly tested on the ground. Recently seven pounds of ore from the Mountain View mine, on being reduced, gave a return of $28. At this writing the vein carrying the rich tellurides shows no signs of diminution, and it is now a demonstrable proposition that the mine in question has more than enough in sight to pay for the mine twice over. The Casson bids fair to become one of the prominent mines of the district. The shaft is 75 feet in depth and furnishes a model which others would do well to follow. The timbers are mathematically correct in their alignment, and the work from the surface to the bottom is indicative that a master hand is in charge. The ores at the bottom of the shaft are improving with depth, and the manager, Mr. Morehead, confidently believes that the next 20 feet will develop into a fine vein of paying ore. There are several sales on the tapis, which in their order will be consummated within the next 20 days. The continuation of the Pacific crosscut tunnel has been let on contract. Billy Davis and Geo. Husband, two well-known and popular miners, were the lucky bidders. Editor Christman of the *Miner* has leased the old Ohio lode and is in a fair way of making some money.

MONTANA.

THE MOUNTAIN LION.—*New North West*, July 12: The strike on the Mountain Lion, in the Oro Fino district, is significant in the fact that the ore is very rich in ruby silver, even impregnating the porphyry seams with which it is stratified. The strike of high-grade ore at 200 feet depth shows that in the Lion, as in the Champion, and presumably in all true fissure veins of the camp, the rich ores are deep. This is what makes a good camp.

THE MINNIE PALMER.—Sam Ritchey, General Manager, came up Monday, bringing some good ore that is now being taken from an upraise on the mine. After sinking the shaft to a depth of 165 feet the water came in faster than it could be handled with the present facilities, and further sinking had to be abandoned for the present, although the vein was widening. The three shifts that were working on the shaft were, therefore, knocked off, and the water raised 35 feet in 24 hours.

THE CHAMPION.—The stopes at the 250 level are rich and productive as ever, but the output is being cut down to about six carloads per month. Last month's output left $11,000 net in the company treasury, and as it is not designed to stope out ore to haul by wagon to pay dividends, the output has been checked and work pushed westwardly on the 350 foot level. At last accounts this was getting better.

THE FRANKLIN.—Owing to the bad air, work was suspended on the Jumbo tunnel of the Franklin Co. four or five weeks ago, and an engine and blower ordered from Chicago. There has been a tedious delay in getting this machinery started.

GOSPEL MOUNTAIN CO.—The Gospel Mountain Co. is making good progress on its shaft, which was down 110 feet on Sunday.

OREGON.

WALLOWA COUNTY GOLD QUARTZ.—*Oregonian*, July 12: The Wallowa *Chieftain* says: Last week the Legore boys brought a very fine piece of gold-bearing rock down from their Pine Leaf ledge. Dr. Dean took the ore, crushed it, and with a common miner's pan got about $1 worth of gold from the specimen. It is estimated that rock equally as rich would be worth about $2000 per ton. We are told that the boys have been throwing similar ore over the dump because it appeared worthless. If one-half the noise were made about our mines that there is elsewhere on less reason, Joseph would be a pretty lively camp this summer. Plenty of work and a little time will bring the Wallowa mines out all right, and you want to remember it. The property spoken of at Joseph, Wallowa county, is considered by many experts, as far as developed, one of the best purchasable properties in the State. It is essentially a silver formation, but this gold rock discovery is nothing new. About a mile south of the Legore claims, the same vein, at 150 feet deep, in another claim, assays $170 in gold, besides silver and lead in paying quantities.

UTAH.

MAYFLOWER BONANZA.—*Record*, July 13: The leasers of the Mayflower No. 7 mine have developed their property into a veritable bonanza. Operations are being pushed with a vim, and since air connections were made with the Woodside, developments are made with greater facility. A large ore chute and ore bin have been built, and from now on the Mayflower will be one of the heavy producers of the district. Peter Boyce sold his one-fifth interest in the lease the other day for $6500 to John Judge.

CAMP CROSSCUTS.—The Kennedy group, between the Anchor and Alliance, is being worked through the 500-foot tunnel. A shaft from the tunnel level, to cut the vein, is being sunk. The water-pipe connections at the new custom concentrator (the Union) have been made, and the concentrator will begin operations Monday morning on Woodside second-class ore. Hughes & Bogan are developing their Woodbine group toward the head of Woodside gulch on the west by a tunnel which is in 140 feet. The prospects are encouraging, although they are working in a red shale formation.

OTHER LEASERS.—John Farish started a force of men to work on his Kerr group, near the Ontario, a few days ago. Two shifts are employed at the Wasatch leased property opening up the vein and prospecting new ground. The Uncle Harry leasers are working their property by tunnel and incline, now about 100 feet under the surface. The leasers shaft on the Nevada and Northland is down about 50 feet already, but they calculate to go down 200 feet before drifting.

ORE AND BULLION SHIPMENTS. — During the week the Crescent shipped 72,000 pounds of concentrates, but no first-class ore. For the week just ended the Mackintosh sampler received 607,950 pounds of Ontario ore; 157,930 of Daly; 76,320 of Mayflower No. 7 leasers'; 70,200 of Alliance; and 61,630 of Woodside ore; total, 974,030 pounds. The Ontario bullion shipment for the week was 42 bars, containing 21,465 fine ounces of silver.

ONTARIO.—The middle of the week sinking in No. 2 shaft of the Ontario from the 1260-foot point was resumed after a cessation of work for a few weeks. The steam pumps below the 1000-foot level are working satisfactorily and are capable of handling the big flow of water.

MECHANICAL PROGRESS.

Crude Petroleum for Manufacturing Purposes.

The Aerated Fuel Company of Springfield, Mass., says the *Scientific American*, have many forges, muffles, ovens and similar fires, using over 1500 burners, in operation, in which the fuel is crude Lima oil, burned by being atomized with a governed air pressure, very similar in quality to natural gas, and free from danger. The advantages claimed are, no increased rates of insurance, no odor, no chimney connection needed, no sulphur or other impurities, perfect combustion and regulation, and cheaper than any fuel, not excepting natural gas, unless the consumer owns his own wells. One pound of oil will do the work of from three to six pounds of the best hard coal in forges, and do it better, with less liability of overheating or burning stock.

The system can be adapted to nearly any forge now in use, but as it is necessary to use from 10 to 25 pounds air pressure per square inch, a compressor of some kind is necessary, as no fan blower will maintain this pressure. This process is already used for japanning, annealing, hardening, drop forging, shovel welding, heating blanks for bolts, riveting furnaces for boiler and bridge work, hoe, fork and rake work, cutlery works, mowing, reaping, harvesting, binding and hay-pressing machinery, scale work, railroad repair and locomotive works, glass and copper works, etc. At the repair shops of the Boston and Albany Railroad Company, at Springfield, Mass., where this system is generally employed, the superintendent states he regards the system as far superior to coal in every respect, particularly for work requiring a high degree of heat at short notice.

The literature of the subject of liquid-fuel burning is in one sense more extended than is suspected, and it would, perhaps, surprise some of our readers if they knew how thoroughly the ground had been traversed by inventors, and what a great number of devises for burning liquid fuel has been tried. There is really very little practical difficulty in burning this fuel. It is all a matter of expense, safety and conditions."

Growth of Marine Engineering.

The enormous size that modern marine engines have reached can hardly be believed by those who have not watched the growth of them during the last few years. The City of Rome's engines have six cylinders, three of which are over seven feet in diameter, and they indicate 11,890 horse-power. The Etruria and the Umbria each have three cylinders, two of which are nine feet in diameter, and the remaining one six. Thanks to these monsters, the Atlantic ocean has become a great ferryway, and the voyage that once required over a month has been made in 6½ days. None of the celebrated Alantic mail steamers have triple expansion engines, but two large vessels that are now building are to have triple engines with forced draft. They are to develop 18,000 horsepower, and are expected to eclipse all of the others in point of speed. Two vessels of the present navy of Italy develop 18,000-horse power, and two others, now building, are to develop 19,500. But the most wonderful marine engines yet designed are those of the Sardegna, which are to comprise 12 main cylinders, arranged triple expansively, and are to develop 22,800-horse power. This vessel, in all, is to contain 62 engines, comprising 90 cylinders.

In this connection it may be remarked that the growth of the steamship interest in Great Britain, and how it is displacing the tonnage of the United States in the carrying trade of the ocean, appears unpleasantly conspicuous from the report of the annual meeting of the Chamber of Shipping of the United Kingdom, just held in London. The president, in the customary address, said that the statistics of last year showed that 35 iron steamers were built or in process of construction, against 57 in 1886, and 256 of steel, against 137; as to sailing vessels, 12 of iron, against 39, and 18 of steel against 11. From these figures he concluded that steel as a material in the construction of vessels was rapidly superseding iron; that sailing vessels, even of larger type, were found unable to compete with the newest type of steamer, and that composite and wooden sailing vessels for mercantile purposes had ceased to be built.

HOW TO PRODUCE SKILLED MECHANICS is the subject of special inquiry by Pres. G. W. Atherton of the Pennsylvania State Agricultural Commission, recently appointed by the Governor, and who is about leaving for Europe in pursuit of information. Of his plans and purposes he says: "The object of the commission is to create public sentiment. Our work is divided under three heads—the need of manual training in the public schools; how this need has been supplied in other countries, and how far it would be feasible to go in combining in the public schools intellectual and industrial education, without the latter interfering with the former. The system has been introduced in the schools of Chicago, St. Louis, Philadelphia, New York and Boston. In England, and on the Continent, the plan has been in operation for a number of years. The result shows that the boys who have been trained in this way become more proficient than apprentices who have worked at a trade during the same length of time. The object is not to teach trades, but to educate the hand and eye in those mechanical processes that prepare the boy to become a better mechanic when he undertakes to learn a particular branch in any of the great industries of the world. When we meet again next fall to compare notes and the results of our information, we propose to present to the legislators a well-digested plan to guide them in framing a proper bill." The establishment of a university for artist artisans is proposed, so that a piece of brass shall not be looked upon altogether from a mercenary point of view, but be converted into an article of beauty, and the United States be enabled to vie with France in the development of artistic skill in the treatment of metals.

PROFITS OF IRON AND STEEL MANUFACTURERS.—A manufacturer of not less than 25 years' experience, who has been reasonably frugal, and who has acquired but a modest competence to represent that long term of hard work and risk of capital, recently sought to make a sale of iron to a consumer who, in less than half that time, had swollen his capital of $25,000 to over $2,000,000. He was not told that his prices were higher than those made by competitors, but that all prices of iron were still too high and would have to be reduced; iron manufacturers in this country were making entirely too much money and must cut down their profits. If they refused to do so willingly they would be obliged to do so against their wills. The immense fortune which had been accumulated by the consumer in question was evidence in itself that so far as the price of his own products was concerned he had taken good care to see that it was high enough. The view of the iron trade taken by this man it not exceptional, or it would not be worth stating. On the contrary, there are many consumers who express themselves in the same way, and, further than that, they endeavor to depress prices by various means, in order to force values down to the level which they insist should obtain.—*Iron Age.*

THE NEW GERMAN METAL, known as germanium, is described as having a great resemblance to antimony, though distinguished by certain well-marked reactions. It is found that if the sulphide is heated in the absence of air, that is, in a current of hydrogen, it forms a blackish crystalline sublimate, which, at a higher temperature, melts to brownish-red drops; this sulphide dissolves in ammonium hydrosulphide, and is again precipitated with a white color by hydrochloric acid, and is again redissolved by ammonia. If arsenic or antimony is present, the color is yellow; if heated in air, or treated with hot nitric acid, white germanium oxide is formed which is not volatile at a red heat. The oxide dissolves in potassium hydroxide. If this solution is slightly acidified, it gives a white precipitate on treatment of hydrogen sulphide. The oxide is easily reduced by hydrogen, the sulphide less easily. The metal is gray, volatile at a full red heat, though less readily than antimony; the vapor deposits small crystals, resembling those of iodine, which do not melt; in a current of chlorine the metal yields a white chloride, which is more volatile than antimony chloride. Such are some of the characteristics of this curious new metal.

AMERICAN IRON-WORK ABROAD.—The London *Iron and Steel Trades Journal* states that "the United States are serious competitors of Great Britain in the matter of the iron-goods importation in the Philippine islands. Germany, Belgium, and also France, make strenuous exertions to secure a due proportion of such trade, and consequently there is a good deal of competition going on." Great Britain, however, it adds, "still maintains her pre-eminence over all others in one class of iron goods—corrugated iron—that material being supplied by our exporters at prices with which foreigners can hardly hope to compete. A great many carriage axles and springs are used in Manilla, and the supply of those is derived from Great Britain and United States, no other country competing."

AMERICAN MACHINERY ABROAD.—It is a remarkable fact, observes the *Iron and Steel Trade Journal*, London, that in the manufacture of different kinds of machinery the Americans can beat us in price. Wages in the United States are about 50 per cent higher than in this country; materials are from 25 to 50 per cent dearer; yet the finished machinery can be put on the market cheaper. It is true that the Americans cannot send out machines to neutral markets any cheaper than is done by our manufacturers; but it is surprising that they can at least meet us in price. This fact is undoubtedly due to the superior methods in the shops of this country, and particularly to the more general substitution of machinery for hand-power.

MALLEABILITY IN IRON is of great use in many ways, and this gave charcoal iron peculiar value; puddling iron is a process to make it malleable without its being taken directly from the ore. In 1882, out of 4,200,000 tons produced in the United States, 2,500,000 were puddled. But puddling is rapidly declining since the introduction and use of soft steel.

WELDING VS. RIVETING.—The use of rivets for seams in boiler-making will soon very generally give way to the cheaper and more effective method of welding by electricity.

SCIENTIFIC PROGRESS.

The Nature of Electricity.

The question, What is electricity? appears to have been satisfactorily answered by Herr H. Hertz, who, it will be remembered, last year succeeded in experimentally demonstrating the undulatory transmission of electrical inductive action through the air and in conduits. Herr Hertz has since made some further experiments, the results of which he has communicated in a paper to the Berlin Academy of Sciences. The rays of electricity are created by a special arrangement, and their presence and effects are shown by a resonator, the latter of which it is Hertz's special merit to have invented. Concave mirrors of zinc plate, which he employs, act on the electric rays as they would on rays of light, and by manipulating these rays all the elementary experiments usually made with rays of light can be repeated. The electric ray shows itself capable of being rectilineally polarized; it is diffused in a rectilinear direction, is reflected regularly like a ray of light, and undergoes, in passing through a prism of so-called hard pitch, a refraction which gives for the material an index of refraction of 1.69. This agrees most singularly with the optical refraction exponent, ranging between 1.5 and 1.6, as given for bodies belonging to the resin family. Herr Hertz, therefore, thinks himself justified in describing electrical rays as rays of light of very great undulatory length, and he concludes his paper as follows: "The experiments described appear to me to be greatly instrumental in removing doubts as to the identity of light, radiant heat, and electro-dynamic undulatory motion. I believe that in future we may confidently utilize the advantages arising from the acceptance of this identity, both to the domain of optics and to electrical science."

Dr. O. J. Lodge has also been making investigations on a similar direction. He holds that light, is an electrical vibration of ether, and has been endeavoring to produce these waves by direct electric action without the intervention of heat. The means adopted was the oscillating discharge of a Leyden jar, with a rate of vibration as high as 1,000,000 per second. The waves thus obtained were about three yards long, but, according to Dr. Lodge, were light in every particular except wave length. To reach the wave length of light, they would require to be shortened from three yards to the hundredth thousandth of an inch. The electric waves of Dr. Lodge travel through space at the same speed as light, and are refracted and absorbed by material substances according to the same laws. Hence Dr. Lodge concludes that if we can generate electric waves sufficiently small we may entirely revolutionize our present modes of obtaining artificial light.

CURIOUS SUPPOSED EFFECT OF THE EIFFEL TOWER.—A Paris correspondent of the New York *Tribune* says: "The Eiffel tower is said to have changed the climate of Paris. As a matter of fact there has been coincident with its existence a marked climatic alteration. We have an amount of sultriness, followed by heavy rainfalls and thunder-storms, which is, to say the least, abnormal. Nights are hotter than I ever felt them before, and New Yorkers find them quite as hot as any they remembered in their own city. It is true that, apart from the sprightly crowd at the Champ de Mars, there is something peculiarly exhilarating in the atmosphere there. Is this because the tower is, like Jupiter, a collector of clouds charged with electricity and productive of thunderbolts? Scientists have not yet said their say. But it stands to reason that when the key at the end of Franklin's kite-string was able to draw down a thunderbolt, the vast mass of iron which springs to the hight of 380 yards into the sky, rather in form of a steeple than a tower, ought to attract to it electricity in proportionate quantities and from great distances. I have been a good deal to the Champ de Mars and never lost an opportunity to mount the tower. I have noticed from it that it is the rendezvous—to speak in a figure—of storm spirits, and, indeed, a kind of vortex into which they rush. When they do this they get unruly, and behave like mad things. As the witches say in "Macbeth," they meet in "thunder, lightning and in rain." Nevertheless, there has not been a single electrical accident on or about the tower.

TWO NEW COLORS are described in various recent technical journals. The first is apparently a reproduction of a color known to the ancients and made by them with sand and lime heated with roasted copper. The pigment, on analysis, appears to be a compound silicate of lime and copper. It is now made with exact proportions of the materials, so that the product is uniform, and the process seems likely to furnish us with a material of great value. The color is a bright greenish-blue so that it will be more available for decoration than French blue or cobalt blue, both of which are of a purplish cast and do not mix well with other colors, while it appears to be as permanent as either of them.

The other color is a black which has been made by treating camphor with sulphuric acid. By steeping camphor in strong sulphuric acid a jelly-like mass is formed of a reddish color. When this is heated it boils, giving off fumes of sulphurous acid, and turns intensely black. By evaporation the unconverted excess of acid and camphor is driven off and a black mass remains, which seems to have the qualities of India ink. Like India ink, it can be apparently dissolved in water, and remains suspended for a long time. We hope that some one will pursue the subject of this camphor-black. A pure liquid black is one of the things that science has searched for in vain for many years, and even so near an approach to it as good India ink would be a most useful substance.—*American Architect.*

NEWLY INVENTED MASTIC.—A French engineer recently discovered a new kind of mastic, which is already largely employed throughout France, and which has even begun to be exported in considerable quantites, especially to Eastern countries. The product, which, it is asserted, is indestructible, is composed of linseed oil, mixed with 93 parts of powdered brick, and 7 parts of litharge, the brick and the litharge being pulverized separately, then well mixed, and reduced to a paste by means of the oil. The object to which the mastic has to be applied should first be dampened with a sponge. After application, in say about three or four days, the coating becomes perfectly hard, and will effectually prevent the filtration of water in terraces, basins and masonry in general.

ENCOURAGING SCIENCE.—The Vermont Microscopical Association has just announced that a prize of $250, given by the Wells & Richardson Co., the well-known chemists, will be paid to the first discoverer of a new disease germ. The wonderful discovery by Prof. Koch of the cholera germ, as the cause of cholera, stimulated great research throughout the world, and it is believed that this liberal prize, offered by a house of such standing, will greatly assist in the detection of micro-organisms that are the direct cause of disease and death. All who are interested in the subject and the conditions of this prize should write to C. Smith Boynton, M. D., secretary of the association, Burlington, Vt.

ARTIFICIAL SUGAR.—A feat of much scientific interest, if not of immediate commercial value, is the recent production of chemical sugar by Fischer and Tafel, in the laboratory of the University of Wurzburg. Glycerine was used as the starting point in the experiments. After decomposition and treatment with various re-agents, a colorless syrup was obtained, which, unlike saccharine, appears to be a genuine sugar, acting in every respect like ordinary natural sugar, except in being incapable of rotating a beam of polarized light. The discoverers expect soon to give even the lacking optical activity to the new product, which is provisionally named acrose.

A SENSITIVE FLOWER.—A lovely flower, called the rice lily, grows thickly in part of southwestern Georgia. It is extremely sensitive to the light. The blossoms fold up at night, but open in the morning. At night, while the lovely white blossoms are closely enfolded in their purple covering and the flowers are asleep, if a lamp is placed near them they will gradually open and turn toward it. If a strong light is placed on one side of the vase containing them, the half of the bouquet that faces the lamp will be unfolded, while the other half that is in the shadow will remain tightly closed.

GLACIAL MOVEMENT AT MOUNT LYELL.—The Virginia *Chronicle* says: The great glacier on the northern flank of Mount Lyell in Mono county, near Lundy, has moved at least ten feet within a year. Last May parties built two monuments of rocks five feet high, one being placed at the edge of the ice, the other at a distance of 15 feet. The upper monument has disappeared and the lower one is but five feet from the ice. Accurate measurements from several permanent points show conclusively that the glacial movement northward has been considerable all along the line.

TIME.—One advantage of living in a small country like England is that one standard time serves for the whole country, namely, that of Greenwich. English time is therefore fixed by that of a point east of which very little of England extends, for the bulk of the British Isles lies to the west of Greenwich. In Ireland the standard time is that of Dublin, which is 25 minutes later than Greenwich, but Ireland is separated by sea from England, and no inconvenience results from the difference of time.

FROMENTINE.—A French chemist named Beaumetz exhibited at a recent meeting of the Paris Academy of Medicine a new alimentary substance which he names fromentine. It is obtained from wheat by the aid of special millstones, and is really the embryo of the wheat reduced to flour. It contains three times more nitrogenous substance than meat, and a large proportion of sugar. It is thought that it may advantageously replace powdered meat as a concentrated food. It may be employed for making soups, and even for making biscuits.

MODIFICATION OF CLIMATE IN DAKOTA.—Cultivation of the soil, planting of trees and the general improvement of civilization have already had a marked influence in modifying the climate of the southern section of Dakota. Old settlers on the east side of the Missouri say that within a few years the changes have been very decided, and that seeding is now begun a month earlier than formerly.

GOOD HEALTH.

How to Keep Cool.

As a matter of fact, says the Atlanta *Constitution*, common-sense persons need no advice on the subject. They are cool under all circumstances and conditions, unless it is when they run to catch a street car that has been sent off by a timekeeper who has no watch.

The way to keep cool is to keep good humored. There is no doubt that good-humored men are sometimes warm, owing to the fact that they are jolly and fat, but no one ever heard them complaining about the weather to any extent, unless it is when they get caught out in a shower without an umbrella.

The Washington *Post*, however, says that the way to keep cool is to eat sparingly of meat, but this is nonsense. The coolest and most agreeable person on earth is the meat-eater, and the most irritable and unhappy is the person whose digestion will not permit him to eat meat.

Eat lean meat—tender steak and chicken—with your vegetables, and you will have no trouble with the heat. Pork should be avoided, of course, but veal, mutton, and all the vegetables, pot liquor and dumplings, buttermilk and corn-bread, go to make up a dinner to be enjoyed.

Above all things, let ice alone. It is a most deceptive affair. It is not only the nidus of microbes and bacteria, but it is unhealthy even when it is pure. It paralyzes the stomach, ruins the digestion and leads to Bright's disease.

If you will drink, as you ought to, drink water fresh from the spring. If you want it seasoned, give it a touch of lemon and sugar, but let ice alone! Ice is much colder in the summer than it is in the winter, and is no more healthy at one season than at another.

We are giving some famous advice here; but the best thing, after all, is to keep in good humor. The good-humored man may get too hot occasionally, but it doesn't worry him—and the man who isn't worried cares little for the heat.

LADY DOCTORS IN INDIA.—In India lady doctors are now familiar to us, and although at first they may have been somewhat ridiculed by those who could not appreciate their value, they are fast making their presence felt for good in almost every corner of the land, says the *Englishmen's Overland Mail*. So far as the native women of this country are concerned, it is gratifying to note that their success in all branches of college education is progressing to the entire satisfaction of their professors. Not only have they proved themselves to be generally well fitted for the arduous duties attendant on medical studies, but they have in some cases succeeded beyond all ordinary expectation. Bombay, Madras, the northwest provinces and the Punjaub all return flattering reports on the subject, and when we say that a class of female students can average over 700 marks out of 1000 in a surgical examination, as we hear has recently been the case, little can be said against their power or skill or aptitude for gaining knowledge in one of the most important branches of the medical profession. Indeed it appears not unlikely that women in India may prove themselves by no means inferior to men in most branches of the practice of medicine, if the progress made by native females in hospital work may be taken as a criterion. In many cases they have proved themselves superior to male students in college examinations, and in no way behind them in application, power of reasoning and resource. The fact that much of their success is due to the great interest taken in their studies by their lecturers and professors is not without a certain special significance.

KEEPING WARM.—It may not be generally known that, when exposed to severe cold, a feeling of warmth is readily created by repeatedly filling the lungs to their utmost extent in the following manner: Throw the shoulders well back, and hold the head well up. Inflate the lungs slowly, the air entering entirely through the nose. When the lungs are completely filled, hold the breath for ten seconds or longer, and then expire it quickly through the mouth. After repeating this exercise while one is chilly, a feeling of warmth will be felt over the entire body, and even in the feet and hands. It is important to practice this exercise many times each day, and especially when in the open air. If the habit ever becomes universal, then consumption and many other diseases will rarely, if ever, be heard of. Not only while practicing the breathing exercise must the clothing be loose over the chest, but beginners will do well to remember, in having their clothing fitted, to allow for the permanent expansion of one, two, and even three inches, which will eventually follow.

THE THOUGHTS OF THE DYING.—At a meeting of the French Society of Biology, M. Fere affirmed that a dying person in his last moments thinks of the chief events of his life. Persons resuscitated from drowning, epileptics with grave attacks, persons dying and already unconscious, but momentarily brought back to consciousness by other injections to utter their last thoughts, all acknowledge that their last thoughts revert to momentous events of their life. Such an ether injection revives once more the normal disposition of cerebral activity, already nearly extinguished, and it might be possible at this moment to learn of certain important events of the past life. Brown-Sequard mentions the remarkable fact that persons who, in consequence of grave cerebral affections, have been paralyzed for years, get back at once when dying their sensibility, mobility and intelligence. All such facts clearly show that at the moment of dissolution important changes take place, reacting upon the composition of the blood and the functions of the organs.—*Wien Med. Zeitung.*

COLOR OF EYES AND HAIR.—M. Topinard has been making a statistical inquiry into the color of the eyes and hair in France, and from his 180,000 observations he deduces many interesting results, one of the most curious being that where the race is formed from a mixture of blondes and brunettes the hereditary blonde coloring comes out in the eyes and the brunette element reappears in the hair. To this tendency probably is to be attributed the rarity of a combination of light hair with dark eyes. Several observers have asserted that the American people, who are pre-eminently a mixed race, are becoming a dark-haired and blue-eyed nation, and if this be true, such a development must be owing to the working of the law formulated by M. Topinard.

DEATH FROM STREET CAR ACCIDENTS in this city from February 1, 1885, to May 1, 1889—four years and three months—aggregate 27, as follows: Sutter street line, 7; Union street, 6; Fourth street, 5; Market street, 2; Omnibus line, 2; Potrero cars, 1; Taylor street, 1; Ocean beach, 1. Of these, 16 are due to cable cars and 11 to horse cars. In addition to the above, 3 persons were killed in this city by Southern Pacific trains, 12 by street trucks, and 8 by wagons, making 54 in all.

TO REDUCE WEIGHT.—One of the easiest ways to reduce weight is to wear a short flannel sweater and ride on a brisk trot. If the horse trots roughly and the rider bounces up and down in the saddle, so much the better. Ten pounds a week can be lost by this process. The best kind of a sweater is made by taking four, six or eight thicknesses of flannel and wrapping them around the loins and lower part of the chest. The upper chest should be left free.

DEATH FROM MINING EXPLOSIONS in England for 1888 were only 43. This is the lowest record since 1851, when the number was first officially given. The lowest previous to 1888 was 65 deaths in 1884. The highest record in the past 33 years was in 1866, when 650 lives were lost by explosions, 360 of these being covered by one casualty at the Oaks colliery.

USEFUL INFORMATION.

ARTIFICIAL SILK.—It is said that Mr. Chardonnet has succeeded in preparing a new artificial silk—a silk which bears the same relation to the natural article as celluloid does to ivory. Its preparation is somewhat as follows: Cellulose (cotton or whatever may be available), after being treated with a mixture of nitric and sulphuric acids in equal proportions, as for the making of gun cotton, is dissolved in a mixture of alcohol and ether, to which is added some perchloride of iron or protochloride of tin and tannic acid. The solution thus obtained is placed in a vertical vessel terminating in a small tube or in a diaphragm pierced with fine holes, so that it can run out into a vessel full of water slightly acidulated with nitric acid. The fine fluid filament which comes out takes on immediately a more or less solid consistency, and forms a thread, which can be wound on a spool. The thread thus obtained resembles silk very closely, and is equally strong and elastic. It is not attacked by water, cold or warm, nor by the acids and alkalies moderately concentrated. By introducing into the solution coloring materials, one may obtain threads of any desired shade. This artificial silk is said to be extremely inflammable—an objection which it is hoped to overcome. It is probable that the nitric acid can be replaced by some other which will render it less combustible. When this progress has been realized, we shall have a new textile fabric of the greatest importance.—*N. Y. Mail.*

A NEW NON MAGNETIC ALLOY.—A new alloy has recently been brought out in Geneva, Switzerland, by Messrs. Osterman and Lacroix, to be used as a substitute for steel in the manufacture of different parts of watch mechanism, such as, for example, hair springs, and balance wheels which are apt to cause a good deal of annoyance through becoming magnetized. The alloy we need, therefore, perhaps scarcely say is claimed to be non-magnetic. It is made up from 30 to 40 parts of gold, from 30 to 40 parts of palladium, 0.1 to 5 parts of rhodium, 10 to 20 parts of copper, 0.1 to 5 parts of manganese, and the same proportion of silver and of platinum. The copper and manganese are first mixed, after which the other metals are added, or all the metals may be put into a crucible at the same time, the manganese being used for the bottom layer.

HOW TO BORE A HOLE IN A PIN.—Place a pin in the end of a cork, in each side of which a penknife has been inserted obliquely. The knives should be as nearly as possible of equal weight. By opening one or the other of them more or less, they can be made to balance. In order to bring them to the exact position required—that is, to bring the pin, the cork and the knives to a horizontal position—place the head of the pin on the end of your finger and ascertain if the two knives are on the same level. If not, adjust them until they are so. Then take the cork in your hand and lay the stem of the pin on the point of a needle, the head of which is fastened in the cork of a bottle. You must carefully change the point of support of the pin until you have found that position in which it remains perfectly horizontal when left to itself. Now blow upon one of the penknives, at first gently and then more strongly. You will thus cause the whole to rotate rapidly. After a time the needle, being the harder, will have worn a tiny hole in the pin, and if you continue the experiment will finally pierce it entirely. The experiment can also be made by placing the pin in a cork in the direction of its axis while the needle penetrates it perpendicularly. The equilibrium is then obtained by means of two forks, as in the experiment of the egg.—*N. Y. World.*

PRESERVATION OF MEAT BY SUGAR.—It results from a special report made to the French Minister of Agriculture that sugar is an excellent agent for preserving meat, and possesses some advantages over salt. In fact, salt absorbs a portion of the nutritive substances and of the flavor of meat. When an analysis is made of a solution of the salt dissolved by water contained in meat, we find albuminoid bodies, extractive substances, potassa and phosphoric acid. Salt deprives meat of these substances so much the more readily in proportion as it enters the tissues more deeply or acts for a longer time. It then results that the meat, when taken from the saline solution, has lost nutritive elements of genuine importance. Powdered sugar, on the contrary, being less soluble, produces less liquid. It forms around the meat a solid crust, which removes very little water from it and does not alter its taste. Thus preserved, it suffices to immerse the meat in water before using it. Although this treatment costs a little more than preservation by salt, account must be taken of the final result and of the loss prevented, which offsets the difference in cost between the two preservative agents. We think that navigators might profit by this.—*Marine Merchande.*

CELLULOID FOR SHEATHING SHIPS.—Among the various uses of celluloid, it would appear to be a suitable sheathing for ships, in place of copper. A French company now undertakes to supply the substance for this at nine francs per surface meter, and per millimeter of thickness. In experiments by M. Butaine, plates of celluloid applied to various vessels in January last were removed five or six months after, and found intact and free from marine vegetation, which was abundant on parts uncovered. The color of the substance is indestructible; the thickness may be reduced to 0 0003 meter; and the qualities of elasticity, solidity, impermeability, resistance to chemical action, etc., are all in favor of this use of celluloid.

RECIPE FOR PLASTERING OUTSIDE BRICKWALLS.—The following is a good recipe for plastering on the outside of a brickwall: Take of slacked lime 60 parts; sand, 35 parts; litharge, 3 parts; knead and work the ingredients into a stiff mass with 7 to 10 parts of linseed oil; use old oil or linseed oil varnish. It should be well worked to the consistency required and applied as other mortars, well troweled down. Or, sand, 90 parts; litharge, 5 parts; plaster of paris, 5 parts, moistened and worked together with a small proportion of linseed oil. Oil the brick three coats before applying the cement, and trowel down.

USEFUL CEMENTS.—For mending valuable glassware, use a cement made with five parts gelatine to one part of a solution of acid chromate of lime. Cover the broken edges with the cement, press the parts together and expose to sunlight. The light hardens the cement, which will then withstand boiling water. For sticking leather, paper or wood to metal, use glue to which has been added a little glycerine—say a teaspoonful of glycerine to a gill of glue. This is a good cement for fastening labels to cans.

CAR BUILDING is becoming an important industry in Stockton. Orders are received from all parts of the Pacific Coast. The work of the present summer embraces orders from Portland, Spokane Falls, Sacramento, Fresno, etc. The business is carried on at the Combined Harvester and Agricultural Works, under the immediate charge of S. W. Elliott. The style of wood turned out is of a superior kind. There is no need that our railroad builders should go East for their cars.

THE KANGAROO, it is said, is in danger of being exterminated. Its skin is so valuable that large numbers of young kangaroos are killed, and high authorities are of the opinion that, unless the process is stopped, Australians will soon have seen the last specimen of this interesting animal.

GLASS FURNITURE is manufactured especially for India, where the rajahs like glittering and showy rooms. Glass bedsteads and chairs, huge glass sideboards and other articles of domestic use are made to suit Oriental taste.

ENGINEERING NOTES.

Importance of the Florida Ship Canal.

A company has been incorporated to construct this canal with a capital of $60,000,000. It is claimed to be entirely feasible, its use saving from 800 to 900 miles in a passage from New Orleans to New York, and the same between all other Gulf and Atlantic ports. It would also save nearly as much on European voyages from the Gulf ports. It would also save the hazard of navigation around the keys of Florida, than which, it is asserted, there is no ocean route more dreaded. To give a pecuniary estimate of this hazard, it was shown in a Congressional investigation that, for the 11 years prior to 1872, the loss by wrecks in passage around the peninsula of Florida amounted to $22,000,000. The saving in cost of navigation, and in freights, as well as insurance, by the use of a canal, can be readily estimated by practical men. Whatever it might be to-day, it would not fail to grow from year to year with the expanding trade of the country.

The *American Economist* says: The importance of opening such a canal has been, from time to time, confirmed by foreign as well as American observers. A report of the Russian Government says: "By the construction of the Florida ship canal the cost of the transport of grain from the Mississippi valley to Liverpool will be diminished more than 50 per cent;" that "it will render the United States the absolute controller of the prices of grain in the British markets;" that Russia would be utterly unable to compete with her." British reports declare that "the Florida ship canal will establish direct trade between the Mississippi valley and Europe."

Evidences are frequent of late that the great West is looking more and more earnestly for available outlets by way of the Gulf ports. The sharp competition which is involved in the successful distribution of the immense and rapidly growing products of the Mississippi valley, will inevitably compel the utilization of all practicable water-ways to reach the coast, and thence the shortest and cheapest routes to foreign markets. An inspection of the map of the United States in relation to the commerce of the Mississippi valley, demonstrates the national importance of the proposed ship canal. It would cheapen the transportation between all Atlantic and European ports and the Gulf ports. It would also cheapen the transportation from Atlantic ports to the west coast of South America. It would be of but little less importance to the commerce of the Western world, than the Suez canal is to Europe and Asia, and the time is not far distant when its construction will be demanded by the people of the United States as an indispensable measure for the promotion of the prosperity of the whole country.

TRANSMISSION OF POWER BY VACUUM.—London *Industries* says that the company in Paris for the distribution of compressed air for working clocks, and also for motive-power purposes on a large scale, has a rival in a company which sells power by means of rarefied air. The works are situated in the Rue Beaubourg, and were established in 1885, and contain three steam-driven air-pumps, which produce in the network of distributing pipes converging at the station a vacuum of about 20 inches of mercury. The motors at the subscribers' premises are similar in construction to small steam engines, and work by reason of an excess of pressure of the atmosphere over that in the exhaust pipes. There are in all some 150 motors at work, varying in power from a half horse-power to 2½ horse-power, and the greatest distance from the station 2500 feet. One of the directors of the company has recently read a paper before the Paris Society of Civil Engineers, in which he gave the efficiency of these vacuum motors at 81 per cent, but the system is obviously only applicable over small areas, and can, therefore, not compete with the system of compressed-air distribution over large areas. An attempt to utilize rarefied air for working dynamos, and thus supply electricity from the station in the Rue Beaubourg, has failed, owing to the low efficiency of the system as a whole and the complications it entails. The company have, therefore, installed at their station dynamos and separate engines for the direct distribution of current, and this machinery is worked in the evening, while the vacuum pumps are worked during the day.

TO WHOM THE CREDIT IS DUE.—Whenever an ocean steamer succeeds in breaking the record, the daily press, and the public generally, says the Boston *Journal of Commerce*, heap their praises on the captain, who "modestly" receives them. But not a word is said about the engineer to whose vigilance more than that of the captain the result is due. The British Government looks at the matter in a different light, and is ready to give honor to whom honor is due. Engineer Burke of the British man-of-war Calliope, the only vessel which escaped from Apia harbor during the great storm there, has been promoted to be fleet engineer in recognition of his services in enabling the vessel to steam out of the harbor.

THE covered bridge at Pavia, over the Ticino, is 500 years old. The roof is held by 100 granite columns.

Passing Events.

The Commissioner of the General Land Office has made a very important decision affecting those foreign mining companies which acquired title through their managers. In the case referred to the manager of a foreign corporation applied for and secured a United States patent for a mine. The mine was jumped and the title was contested on the ground that he had obtained the patent for the company, and a foreign corporation cannot enter land. This view is upheld by the Commissioner, notwithstanding the patent had been issued for years.

A cloud-burst on the Klamath river has done great damage to the dams and wheels of the miners for a long distance down the river.

Secretary Windom has taken a middle course in the matter of imposing a duty on silver ores containing lead. He has not decided at all on the question of duty, but has issued instructions as to the method of sampling ores on the frontier.

Government surveyors are in camp at Donner lake, and will locate reservoirs and ditches and estimate construction of works for storing water in that vicinity.

It is expected that the U. S. Debris Commissioners will visit Nevada county very shortly with a corps of assistant engineers to make surveys for ascertaining the practicability of building restraining dams, estimate the auriferous gravel yet unworked, etc.

An Unsurpassed Record.

Every now and again the prediction is made that some newly discovered mine bids fair to eclipse the famous Comstock mine of Nevada. "The ore is just like it. The width is unknown. The characteristics are similar, and when depth is attained, it is expected to furnish better ore." This all sounds very well, but none of the predictions have been verified or ever come anywhere near verification. In the first place, the Comstock does not consist of a mine, but a big lode, on which there are numbers of mines, each with independent records. Some of these have never paid a cent to their owners; and others have paid out fortunes. There are mines on the lode which have been worked constantly for years and never yielded enough to pay expenses.

One mine alone has a record unsurpassed by any in this country. This is the Consolidated California and Virginia. This was originally one mine, was divided into two, and again consolidated as one. The last dividend was declared on the 3d instant, and was No. 28 of the consolidation. Of these, one declared in January, 1886, was 30 cents per share, and the balance 50 cents per share each, beginning January 3, 1887, making a total of $3,024,000 paid since the ore discovery in October, 1886, and $3,088,800 since the consolidation of the California and Consolidated Virginia mines under the present title.

Prior to the consolidation those mines paid nearly $102,000,000 in dividends to shareholders, making a total of $105,088,800 paid in dividends from bullion realized from ore extracted within the boundaries of the Consolidated California and Virginia mine. Of that vast sum $100,000,000 was disbursed to shareholders in less than four years.

The dividends paid since 1886 by the company aggregate a total of $13.85 per share—nearly double what the stock is now quoted at.

This is only the record of one mine on the Comstock lode, and there are many others which have disbursed millions in dividends. This record is of dividends, not production. During all this time the expenses have been enormous. Magnificent machinery has been purchased and the mine fully equipped in every way.

In some of the newer camps, particularly those in the Northwest, when a mine has paid a few hundred thousand dollars in dividends, it is held up to public inspection as a second Consolidated California and Virginia. But all of these have got a great deal to do yet to show a record one-quarter as good. Of course it may be said that these new mines have yet to pay their profits, while those of the Comstock mine have been paid. This argument would be better if the Cons. Cal. and Va. had stopped dividends, but it has not by any means.

Thus far no "second Comstock" has been discovered in this country, nor has there been a second Consolidated California and Virginia.

SUTRO TUNNEL.—On last Monday the right for redemption of the Sutro tunnel, Virginia City, Nevada, expired, and consequently the mortgagees intend taking action in court to secure possession of the property. When they come legally into possession of the tunnel, they will form or reorganize a new company and formulate plans for the future. It is generally understood that no new work can be or will be commenced by them previous to October of this year.

THE MINT CLOSED.—The transfer and counting of between two and three millions of gold coin from the Sub-Treasury to the Mint will delay the opening of the latter institution under General Dimond's administration until August 1st. No new appointments will be made or business transacted before that date.

IF the Puyallup reservation can be sold at the present value of land, each Indian will receive $20,000 in cash.

American Mineral Products.

On pages 42 and 43 of this number of the PRESS is given an abstract of the result of the work of American miners last year. The showing is a magnificent one and exhibits clearly the progress made in this branch of industry. The statistics have been carefully gathered under the superintendence of Mr. David T. Day, who has proven himself well adapted to his task, taking great personal interest in the work and carrying it out skillfully. The following figures show in condensed form the production of mineral substances in the United States last year:

METALLIC PRODUCTS OF THE UNITED STATES IN 1888.

	Quantity.	Value.
Pig iron, spot value, long tons ...	6,489,733	$107,000,000
Silver, coining value, troy ozs...	45,783,632	59,196,000
Gold, " " " " ...	1,604,927	33,176,000
Copper, value at N. Y. City, lbs.	231,270,622	32,333,954
Lead, val. at N. Y. Cy, short tons,	180,555	15,924,951
Zinc, val. at N. Y. Cy, short tons,	55,903	5,506,855
Quicksilver, val. at S. F., flasks..	33,250	1,413,125
Nickel, val. at Philadelphia, lbs,	195,182	115,518
Aluminum, val. at Phila., lbs...	19,000	65,000
Antimony, val. at S. F., sh. tons,	100	20,000
Platinum, value (crude) at N. Y. City, troy ounces.....	500	2,000
Total.....		$256,245,403

NON-METALLIC MINERAL PRODUCTS OF THE UNITED STATES IN 1888 (SPOT VALUES).

	Quantity.	Value.
Bituminous coal, long tons.....	91,106,998	$122 497,341
Penn. anthracite, " "	41,624,610	89,020,488
Building stone.....	.....	25,500,000
Lime, barrels.....	49,087,000	24 543,500
Petroleum, barrels.....	27,346,018	24,598,559
Natural gas.....	.....	22,662,128
Cement, barrels	6,253,295	4,533,639
Salt, barrels	8,056,381	4,377,204
Limestone for iron flux, long tons,	5,438,000	2,719,000
S. C phosphate rock, long tons..	433,705	1,951,673
Zinc-white, short tons.....	20,000	1,600,000
Mineral waters, gallons sold	9,628,568	1,709,302
Borax, pounds.....	7.589,000	455,340
Gypsum, short tons	96,000	480,0 0
Manganese ore, long tons.....	25.500	255,000
Mineral paints, long tons	24,000	380,0.0
New Jersey marls, short t ns....	600,000	300,000
Pyrites, long tons.....	54,331	167,653
Flint, long tons	30,000	175,000
Mica, pounds.....	48,000	70,000
Corundum, short tons.....	589	91,620
Sulphur, short tons	.....	.....
Precious stones.....	.....	64,850
Gold quartz, souvenirs, jewelry, etc	.....	75,000
Crude barytes, long tons.....	20,000	110 000
Bromine, pounds.....	307,386	95,290
Feldspar, long tons.....	8,700	50,000
Chrome iron ore, long tons	1,500	20,000
Graphite, pounds.....	400,000	32,000
Fluorspar, short tons	6,000	30,000
Slate ground as pigment, l'ng tons	2,500	25,000
Cobalt oxide, pounds.....	12 266	18,441
Novaculite, pounds	1,500,000	18,000
Asphaltum, short tons	53,300	331.500
Asbestos, short to s.....	100	3,000
Rutile, pounds	1,000	3,000
Total.....	.....	$328,914,528

RESUME OF THE VALUES OF THE METALLIC AND NON-METALLIC MINERAL SUBSTANCES PRODUCED IN THE UNITED STATES IN 1888.

Metals	$256,245,403
Mineral substances named in foregoing table..	328 914,528
Total.....	$585,159,931
Estimated value of min l products unspecified,	6,500,000
Grand total.....	$591,659,931

Astronomical Society of the Pacific.

The next regular meeting of the Astronomical Society of the Pacific will be held in the library of the Lick Observatory, Mt. Hamilton, on Saturday, July 27th. Papers will probably be read on "The Eclipse of Jan. 1, 1889," by various members; "On the Eclipse of Dec. 21, 1889," by E. S. Holden; on "Observations of Jupiter," by E. E. Barnard.

The program for the journey is as follows: Members may take the earliest trains (broad gauge) from foot of Market street (via Niles), or from Third and Townsend streets, arriving at San Jose shortly before 10 o'clock on Saturday morning. They will be met at the station by stages. The start from San Jose will be made very promptly at 10 o'clock, in order to arrive at Smith Creek about 1:30. Here dinner can be had, and by starting promptly the summit can be reached about 4 o'clock. A meeting of the Board of Directors will be held in the library immediately on arrival, and as soon thereafter as may be, the meeting of the society will be called to order. The observing-rooms are not opened till 7 P. M., and the time after adjournment until then can be well utilized by taking a short walk to one of the neighboring summits, from which magnificent views of the valley can be had.

At 7 P. M. the domes of the 12-inch and 36-inch equatorials are opened, and all visitors take their turns in looking at the most interesting celestial objects which are in convenient situation. About 10 P. M. the visitors leave, and the members of the society will then have a further opportunity of seeing other heavenly bodies. As many of the members as can be accommodated by the astronomers resident at Mt. Hamilton will be personally invited to spend the night on the summit. The others must return to Smith Creek hotel in the stages, which will leave the summit about 11:30 P. M. At the hotel, rooms will be ready for members. The stages returning to San Jose leave Smith Creek about 8 A. M. and 1 P. M., in time to connect with the various trains to San Francisco. The expense of the journey to each person need not exceed $8.

Immediately on arrival at the observatory, each member should register his name in the visitors' book, and those who are to remain on the mountain over night should find their quarters and leave their luggage there. A list of the guests assigned to rooms at Mt. Hamilton is always posted on the blackboard in the library room.

Furnace Development.

Except in the old Catalan forge or its modifications, attempts to make iron and steel directly from ore in a practical and economical manner have failed so frequently that such schemes are looked upon with justifiable distrust. All have failed from one cause or another, although in some instances every indication of a practical success was at first manifest. Not long since, F. Lynwood Garrison of Philadelphia made a visit to Russia, and after observing the practical success of the furnace in the iron works of Count Stroganoff at Dobriansky, in the Government of Perm, he investigated the history of similar furnaces in Finland and Russia. His observations were read before the American Institute of Mining Engineers, and descriptions of the furnaces were given in the MINING AND SCIENTIFIC PRESS of Feb. 23d and March 2, 1889. The cuts given herewith on page 41 show the forms which led to the development of the Dobriansky and Wartrilia furnaces. One of the cuts shows the old type of furnace which has been in use in Northern Europe since pagan times. It should, perhaps, more properly be called a high-bloomary furnace or forge. It was with this type of furnace that M. Husgafvel began his experiments at Porsaskoske in 1875, but attempts to obtain better results with larger ones of the same type were failures.

A movable hearth of three-eighths-inch iron, lined with a mixture of clay, quartz and lime, was next tried, but was rejected for one of cast iron without any lining. By means of this movable hearth a continuous operation of the furnace was obtained. Two tuyeres instead of one were used, and the size of the furnace increased as shown in the cut, having been made in 1875. The productive capacity and economical results were thereby improved, but the product was not homogeneous.

To avoid certain difficulties and decrease temperature of the blast, the walls were made thinner and tuyeres cooled with water were inserted. The furnace thus altered was built at Pankakoske, Finland, in 1880, and is shown in one of the cuts. The results were superior to any previous ones, but irregularities in its operation could not be avoided.

In 1882 a furnace such as is shown in the figure was erected at the Porsaskoske Iron Works. The lower part was made of hollow cast-iron segments, so arranged that each segment formed a separate closed apartment, connected with its neighbor by a bent tube. The blast entered at the highest and made its exit from the lowest segment to the tuyeres, which were, as in the previous furnaces, inserted through the lowest segment. Observation holes, covered with glass, were arranged in the outer cast-iron wall, so that the degree to which the inner wall became heated could be observed. The furnace having been blown out a number of times, the condition of its interior could easily be determined, and it was found that the corroding action of the process affected but slightly the inner cast-iron walls, which had no lining. The greatest improvement in this furnace over the previous ones was, that the iron never stuck to the walls, and although the temperature in the lower part of the furnace was comparatively low (scarcely dark-red), a good welding heat was nevertheless predominant in the hearth. It worked, however, with only fair regularity.

The principles of this furnace were in 1884 applied to a larger one at the Wartrilia Iron Works, Finland. This furnace was illustrated and described in the PRESS of February 23d last.

MANY wells in the Big Bend country, Washington Territory, have gone dry recently.

Steam Schooners.

An industry which has of late years grown to large proportions in this city is that of building steam schooners or steamers intended for the coastwise trade. Last summer there were built in this city nearly 20 steam schooners for the Alaska trade alone, besides those for lumber ports. We give an illustration on this page of a type of steam vessel such as those for the Alaska fisheries and canneries. This was built by J. B. Jardine of the Atlas Iron Works. These schooners are supplied with ample sailing power so that they can make as good time under sail as ordinary vessels of that rig; and their auxiliary steam-power permits them to make good headway against the strong northwest winds which prevail on this coast in summer. They can also make their landings easily and handily and get in and out of harbor without loss of time or having to depend on wind or tide.

Should we ever get a canal through the Nicaragua route, we will in this city be in a position from the experience we are now gaining to get up such a "boom" in steamer building as the Clyde had after the Suez canal was completed. The whole Atlantic Coast wants our redwood, and we will need steam vessels with modern triple and quadruple expansion engines to carry our wine, wheat, fruit and other products to the more populous centers of the world.

While it is true that the majority of the vessels thus far built here have been comparatively small, larger ones can be built just as readily. The demand for the type most in use on this coast was very readily met, and when there is need of larger vessels for further development of distant trade it can be met as well. The steam schooners built in San Francisco are as good as any in the world. The Pacific is by no means pacific in these latitudes or farther north, and heavy seas with strong gales have to be overcome. It is conceded by all seafaring men that our local vessels are the best carriers possible, and they make good passages with great economy of fuel. Our builders have shown themselves masters of their business. Vessels built in this city are running alongside the steamers turned out from the crack Eastern yards and doing the same work for 25 per cent less expense.

The firm that built the steamer shown in our illustration is now at work on its thirteenth vessel and more are to come. Mr. Jardine has had good success with his steamers, having turned out from his shops some fine specimens of marine engineering. He is about to enlarge his business facilities so as to be able to build and fully equip steam vessels without outside assistance. Mr. Jardine's patent keel-condenser has attracted the attention of mechanics elsewhere, and some from the East and Australia have been negotiating with him for its use.

The Atlas Iron Works have also given a great deal of attention to mining machinery, and they are about putting on the market an iron-frame stamp-mill which we shall illustrate and describe shortly, as it seems to possess many good points. The works also do a general business in building all kinds of machinery.

FOR the month of June the output of the Drumlummon mine, Montana, was $126,200; working expenses, $53,000.

Vulcanized Rubber Belting—Butt-Splicing.

The testimony of the many who have used the vulcanized rubber belting manufactured by the New York Belting & Packing Company stamps it as unequaled in strength, durability and traction-power. Vulcanized rubber belting was first introduced by this firm some 40 odd years ago. In the matter of tensile strength, the superiority of belts made of this material has long been conceded, and is due to a webbing of cotton duck, through the meshes of which the rubber is driven by powerful machinery.

This duck is made expressly for the company by Brinckerhoff, Turner & Co., New York, and possesses more than double the strength of that used for ship sails. The rubber itself is prepared by an elaborate process. The sulphur used to vulcanize it is weighed with the greatest care and mixed with metallic oxides, making a semi-metallic compound that gives to the rubber a very considerable degree of firmness, and enables it to resist high degrees of heat, and at the same time does not reduce its elasticity too much. The different thicknesses of rubber used in the manufacture of a belt are laid over one another, so that by folding over the outside strip at the edges, a perfect, even and rounded edge is secured. In this form the thicknesses are passed between powerful heated rollers and afterward finished in a steam press.

Steam is let into the bed and platen of the press in a way that enables the engineers to control the temperature perfectly, and the pressure and heat are applied simultaneously to the rubber, while it is under the heaviest strain that it is designed to subject it to when working machinery. The fibers are thus pressed together as compactly as if steel instead of rubber and duck. The company makes this belting in any size desired, uniform in width and thickness. It will endure great heat and cold without injury, and is especially well adapted for service in wet or damp places, or where exposed to the action of steam. In addition to these advantages, the first cost of vulcanized rubber belting, especially for wide belts, is far below that of leather. This, with their greater ability for service and long endurance, makes them cheaper to the consumer than other belts.

In Fig. 1 we illustrate the manner of butt-splicing vulcanized rubber belting. The belt to be adjusted to the pulley (depending on the thickness of the belt) should be cut shorter than the distance around the pulleys by one-eighth to one-fourth of an inch for every foot when measured with a tape or string drawn tight. For narrow belts, make two rows of holes in each end, thus obtaining a double hold; butt the ends together and lace with lacing leather. For wide, heavy belts, the company recommend a riveted lap-splice, which is fully illustrated in Figs. 2 and 3. In Fig. 4 is shown a back-splice intended for wide belts, where the riveted lap-splice is not used. To make this splice, butt the ends, and, in addition, sew or rivet a piece of rubber belting on the back to strengthen the joint, equal in length to about one-half the width of the belt.

The principal factory of the New York Belting & Packing Co., and the oldest one engaged in the rubber business, is at Newtown, Conn. They also have another at Passaic, N. J. This company is the oldest and largest manufacturers of vulcanized rubber goods for mechanical

BUIT-SPLICING RUBBER BELTING.

TYPE OF STEAM SCHOONER FOR THE ALASKA TRADE.

purposes in the United States. Its office, salesrooms and warehouse are at No. 15 Park Row, New York City, directly opposite the Astor House. The firm has branches in all the principal cities of the country, and also representatives abroad. Mr. John H. Cheever is the treasurer of the company and general manager of the business.

STEAM BOILER NOTES

Why "Black Paste" Accumulates on Steam Chests and Cylinders.

Professor James E. Denton of the Stevens Institute, Hoboken, N. J., has been investigating this subject at the request of a number of dealers in lubricating oils, to discover whether it was attributable to the oil. The results of the investigation warrant the conclusion that the deposits are not attributable to any particular quality of the lubricant used, but arises from the admixture of solid matter with the lubricant, the solid matter being brought into the engine cylinder from the boiler by the steam, and precipitated from the latter by cylinder condensation.

Samples of deposits collected from locomotives and stationary engines in various parts of the country, and from marine engines, all showed the same average composition, viz., oil, combined with lime, lead, manganese, etc., 40 per cent; iron, 20 per cent; lime, magnesia, lead, zinc, copper, etc., 40 per cent. From these it was concluded that the oil and iron might be accounted for by the use of the lubricant and possible wear of cylinders, but that 40 per cent of foreign matter must come from the boilers.

A large compound blowing engine at an iron works broke its piston ring through the accumulation of a hard, black deposit under the rings. The same deposit was found throughout the cylinder passages and in the receiver. The oil used was the purest petroleum, yet the analysis of the deposit showed considerable animal oil. Upon investigation, it was found that the boilers took water from a stream just under a grating where there was always an abundant accumulation of all sorts of animal grease. The grease could only have reached the engine cylinders through the boilers.

The engine had not had its cylinders open for a long period, and the boilers were seldom cleaned, as the works ran night and day, and the plant was overloaded. The hypothesis that the boilers sent over foreign matter to the cylinder which contaminated the lubricant, was, therefore, further supported by this instance. Specific knowledge was accordingly sought of the condition of the interior of the boilers in the case of some engine making a deposit.

For this purpose the boilers of an Atlantic steamship were the best, and tests were made over a series of voyages. The highest grade of petroleum was used and the paste gathered showed about the same composition as above, and a change to a mixture of petroleum and a large percentage of the finest neatsfoot oil showed no marked change in the composition of the deposits. All evidence, therefore, was still consistent with the hypothesis that the miscellaneous matter in the cylinder deposits had their source in the boiler. Such matter must then go over with the steam, notwithstanding that by distillation water is ordinarily supposed to rid itself of impurities.

To settle the matter, condensed steam was collected in bottles and it was found contained 10 grains of solid matter to the United States gallon. The evidence tended to prove that the dirt in the cylinder originated in the lack of cleanliness of the boiler. This 10 grains per gallon would account for a much larger percentage of dirt than is actually found in the cylinder, and tests with a sectional boiler using very pure water were made and in seven months' use produced no deposit of any kind.

The general conclusion, therefore, is that deposits of "black gum," etc., in engine cylinders are not caused by absence of any proper quality in the cylinder lubricant but by the contamination of the latter with dirt, which may be furnished by the boiler if the latter in any way accumulates foreign matter upon its interior surfaces.

HOW STEAM-POWER IS WASTED.—The Westinghouse Machine Company recently sent experts equipped with the necessary instruments to visit a number of prominent manufacturing establishments in various parts of the country to test the consumption of power by each machine. As a rule, permission was readily obtained from the owners, they seeming much interested in the results, which are amusingly indicative of the carelessness shown in such matters. Nearly all were found to be wasting one-half their engine's power in doing other than useful work. One prominent establishment was wasting 65 per cent of its fuel and power; another was wasting 73 per cent, thus leaving only 27 per cent of the engine's power to earn money with. Another celebrated firm (known all over the West) was using a 60-horse power engine, of which 55-horse power was being consumed in dead work; thus leaving just 5-horse power with which to produce goods for sale.

TEMPORARY ENGINES.—When an accident to an engine takes place that makes a long shut-down probable, says a cotemporary, the substitute is usually of a peculiar type. A recent case came to our notice, an old slide-valve engine being hastily set up to drive a portion of the mill. The engine was set on beams resting on the ground. To render it firm and steady a heavy stick of timber was placed against the cylinder head and the wall, another to the cylinder and ceiling. The engine trembled and at each stroke shook as though it could not stand another, yet that engine has run a week and is expected to run another. It was overloaded, of course, and the belt slapping about clearly showed the excessive load, but what was also noticeable was the unison of the movement of the belt and engine. The belt would increase its slapping tendency with each stroke, and then gradually decrease for a few strokes and commence when again in unison with the beat of the engine.

SAFETY OF BOILERS.—A boiler may be inspected to-day and found to be safe under a working pressure of 100, and be weakened tonight by low water so as to be dangerous to-morrow with 50 pounds pressure. It may explode a month hence with 60 pounds pressure and plenty of water, but the cause is as certainly low water as if it had exploded when the water was low. There is but one sure remedy, and it is a simple one. Put on a safety water column, not some complicated device which is pretty in theory and worse than worthless in practice, or some untried and perhaps inoperative low-water detector, or a fusible plug which becomes coated with scale and fails to fuse, but a real safeguard, something simple, which has been tried and proven to be trustworthy by steam-users whose judgment can be relied upon.

THE USE OF MUD DRUMS.—Recently a mud drum in a boiler at the works of the Mahoning Iron Company, Youngstown, Ohio, gave way, causing the boiler to explode and wrecking four others in the battery. One man was killed and several others were severely injured. Why a mud drum is used in these times is hard to understand. They are put in as a place to deposit sediment, but it is very poor practice that will not say sediment should not be allowed to accumulate anywhere in a boiler. A two-inch blow-off properly set and used every few days will keep a boiler pretty clear of sediment. It weakens the boiler and is very liable to give out, causing an explosion as in above case. Mud drums should be abolished.—*Cotton, Wool and Iron.*

THE USE of crude petroleum for fuel under boilers seems to be somewhat on the increase. The last steam plant to be fitted up for that purpose belongs to the Boston & Albany Railroad, which generally investigates thoroughly the merits of an article before going to the expense of adopting it. Three burners are used under each of the 80-horse power boilers, the oil being forced up to the feeders and kept at a steady flow. It is said that it makes a steadier heat than it is possible to obtain from coal, but it is feared by many, and with good reason, that the life of a boiler using this fuel will be very short; besides, it is rather dangerous as yet.

THE FIRST CORLISS CUT-OFF.—In 1848, on the 17th of February, Geo. H. Corliss started his first engine with variable cut-off valves. The engine was the first of its kind wherein the regulation of speed is effected by the time of closing the induction valves, and was the beginning of a type now made the world over. The engine was of 260 H. P., and constructed throughout with reference to this method of working. The cylinder was twenty-two inches in diameter, and the stroke six feet.

REPAIRING A STEAM PIPE BREAK.—An ingenious means of repairing a break in a steam pipe consists in binding the break with wood strips, laid close together, and well served around with stout cord or rope, endwise separation being prevented by more rope crossing the break diagonally, and tied so as to draw the broken parts together. On the wood and the cord getting wet with steam, the joints become tighter than before, as the wood swells and the cords tighten.

WHEN an exhaust injector fails to work, look to the temperature of the exhaust steam for the cause. An exhaust injector will not work unless the steam has a temperature of 212 degrees. In many cases, the vapor reaches the injector at a temperature considerably less and is unable to do any work. Steam is supposed to become water when its temperature is less than 212 degrees, but put a thermometer in the exhaust pipe near the injector, and note the temperature.

TO DETERMINE THE SAFETY PRESSURE OF A BOILER.—If you ascertain the thickness of a boiler shell in decimals of an inch, and shift the decimal point three places to the right, and then divide the number thus found by the diameter of the boiler in feet, the quotient obtained will be the safe working pressure in pounds for that boiler.—*Safety Valve.*

REMEMBER that the improper management of a boiler when in operation, and the neglect of proper inspection, are the causes that operate most frequently to produce explosions.—*Safety Valve.*

SAWMILL NOTES.

The Working of Circular Saws.

For the benefit of our readers who are desirous to become acquainted technically with the physical laws governing the working of circular saws while they are cutting their way through timber, we make a few quotations from a Western contemporary that has of late been considering this matter:

Take, for example, a large circular saw. As running ordinarily, the precise point around which radiates the metal may be considered the true center of the saw, but, as all must know, the moment a substance comes in contact with the surface this center is removed. If we place an obstruction, as in the place of a log to be sawn in twain, against the outer edge of one of the teeth, this center is removed to a point directly opposite this point of contact. Supposing, for instance, that the saw is precisely 3 feet 6 inches from the true center when in motion without any obstruction to the outer point of the tooth, then the saw would, of course, be 7 feet in diameter, so from the point where it first meets the obstruction to the center would be a leverage of 3 feet 6 inches, and an obstruction requiring a force of 15 pounds to force through would remove the center .036, less .015, in the opposite direction, or, in other words, about one-half an inch from where it originally existed, and as a perfectly round saw—an utter impossibility—will touch at but one point at once as it revolves, it is plain to be seen that the true center is constantly changing position, it being backward, forward, above and below, according to the variety of timber, regularity of feed, etc.

In addition to this change, we have another influence to overcome which also causes another change, and an important one, viz., when the saw meets this obstruction there is not a wheel or pulley in the entire building, from the saw to the drive-wheel, but feels and responds to the change of center. We have first, pulley on the arbor which propels the saw—its center changes with every motion of the saw's center, and so on to the end. Right here is the primary source of the loss or misapplication of power, and if any one can devise means by which these reverse forces may be overcome, we can run our machinery at about 100th the power now required.

But leaving this point for the present, we will return to the saw and note the changes going on there, while these forces in juxtaposition are being equalized sufficient to realize the little we do from the power at hand. The saw, then, being composed of a material susceptible of withstanding immense tension, or else with this unequal leverage spoken of in the foregoing, would tear it asunder. The particles of iron—called technically the molecules—constituting the saw as held together by two recognized forces, the one molecular cohesion is apparent in all metals, the other the mechanical amalgamation of these particles, enables the material composing the best make of saws to withstand these unequal pressures for some time, but after a time, unless sooner worn out and filed away, the results of these will become apparent and are manifested in various ways, such as getting out of true, a constant tendency to move in a wabbling shape, and the like, all or any of which indications culminate in a break. It must be borne in mind that the tension is always in the same direction, namely, from the cutting edge backward, and if by any means it could be arranged that the saw in passing backward could be subjected to the same tension as in passing through the log, it would stand just twice as long as it now does. It really appears that a saw could be made that would do work each way, thus not only getting more wear out of it, but an immense amount of now lost motion would be utilized and a reverse action and influence being brought to bear on all the machinery, these two forces would neutralize each other and the pulleys, wheels, shafting and everything last nearly if not quite twice as long.

Commenting upon the above, the Boston *Journal of Commerce* says: All users of saws are invited to participate in the search for the new center, and if possible confine it within the limits of the saw bench. How one resistance can neutralize another, or the amount of power to drive a saw can be lessened a hundredfold by bringing as much load on the opposite half, is difficult to comprehend. This additional resistance may remove a portion of the strain upon the saw-arbor boxes, but when the truth is known it will be found that every additional resistance will call for a corresponding increase in the power transmitted. This technical principle of the physical laws governing the action of saws must be very inviting to those interested in the art of gearing, as it would only need the power to be applied by gear wheels to be connected with the driving wheel by means of two driven pinions diametrically opposite on each side of the driver. We will leave the subject for the comments of those of our mechanical readers interested in this matter, whom we expect soon to hear from.

A LATE INVENTION for the use of sawmills, called the rosser, or log-siding machine, removes the bark and the outer slab from a log, forming a cant of the required dimension without the use of a circular, and is regarded by those who have used it as a valuable device. The log is passed through a set of revolving wheels with a series of knives which grind off the outer slab upon the log, and it passes thence directly to the gang or circular, to be cut as required. It leaves no slabs, as the entire amount which would, in the old process, form slabs and thin boards, is ground up by these knives. The principal advantage claimed for it is the great saving of time. One is now being put into the Sawyer-Goodman Co.'s mill at Menominee, Mich.—*Saginaw Herald.*

How to Manage a Saw.

The first step in the successful management of a circular-mill saw, says the *Sawmill Gazette*, is to buy a good one fully warranted—one adapted to its work and to the man who runs it. A thin saw requires a greater number of teeth and a more expert man than a thick one. It should be of stiff temper. It is more easily broken, more susceptible to misuse and negligence. Care should be taken that the arbor does not heat, that the track is in line, that the saw fits the arbor easily, and that it is hung true. Hardly any two saws hang alike on an arbor. A slight difference in the finish of a saw about the hole, or in the turning of the collars, makes a perceptible difference on the edge; and this should be remedied by rings of paper. A saw should be jointed carefully on the mandrel on which it runs, which can be done by pushing a piece of emery-wheel squarely across the teeth while the saw is in motion.

Any good mechanic can take a buckle out of a saw by using as an anvil a block of hardwood set in the ground, with the top slightly rounded. Never use a steel or iron anvil, as it changes the tension. If the saw becomes rimbound or snakes, it must go to the sawmaker. A circular-mill saw, to work freely, should be properly gummed, and set enough to clear the saw nicely; the teeth should be from 1½ to 2 inches deep, with a gullet, and the backs of the teeth should be kept low enough to avoid striking the timber and rub. An emery-wheel is the best saw gummer, but great care should be taken not to blue the teeth, and to keep them in uniform space and depth. The pitch of the teeth should be regulated somewhat by the work a saw is doing. From one-fifth to one-sixth of the diameter, measured from the edge, will give the proper circle. A sawyer who does not know his speed can tell whether his saw needs expanding in the center or on the edge by warming it in the different places with a narrow board while running, and watching results. Always avoid sharp corners, and always warm saws up in winter before putting them into the timber.

THE SAW VS. THE AX.—In California the saw has largely supplanted the ax in bringing down redwoods, but the change is severe upon the woodsmen. After being sawed partly through, a tree is forced over by inserting a number of steel wedges in the kerf, which are driven in with steel sledges. They are set in as close together as possible, and the driving of the wedges frequently takes three hours or more. The constant contact of the steel sledges with the steel wedges results in chipping off fragments which fly with great force, and in numerous instances become imbedded in the flesh of the workmen, requiring a surgical operation to remove them. Many eyes have been lost in this way, while arm and shoulder wounds are frequent. Some means of protection against the sharp missile is needed, but a man swinging a hammer cannot be muzzled up to any great extent.—*Northwestern Lumberman.*

A PLANK was recently caught on the pony saw of Hobbs, Wall & Co.'s mill at Crescent City, and thrown through the air a distance of 100 feet. No one was injured.

AMERICAN MINING AND STOCK CODE

"KELLOGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded postpaid on receipt of price by

The Academy of Sciences Building.

Laying the Corner-Stone.

On Friday of last week the ceremony of laying the corner-stone of the new building of the California Academy of Sciences on Market street, near Fourth, was performed. The officers and trustees were on the platform, surrounded by members and friends. At 1 P. M. the officers of the academy assembled in their office, at room 17, Flood building, and after making a selection of the various articles and papers presented for insertion in the corner-stone, placed the following in the copper box, one cubic foot in dimensions, and sealed it up:

Photograph of James Lick.

Picture of the new Academy of Sciences building.

Deed of trust of James Lick, dated September 21, 1876.

Three copies of Constitution of Academy of Sciences, with names of members, in 1876-'81 and '89.

Directory of San Francisco for 1889.

Copy of Irving M. Scott's address upon the occasion of laying the corner-stone.

Proceedings of the academy in pamphlet form.

Memoirs of the academy, containing pictures of animals, plants, etc.

Copies of the San Francisco papers.

Report of the Lick Trustees.

Photograph of the great Lick telescope.

Formal recognition of the transfer of the Lick Observatory to the State University.

Register of the State University for 1887-88.

Meteorological reports of Oakland, by Dr. J. B. Trembley.

Portrait and biography of Governor Waterman.

The Exercises.

At the appointed time Colonel C. F. Crocker, President of the Board of Trustees, mounted the temporary platform and called the assemblage to order.

Colonel Crocker, in a few well-chosen words, stated the object of the occasion and the pleasure it afforded him to preside at such a momentous event. He then introduced as orator of the day Irving M. Scott.

Irving M. Scott's Address.

Mr. Scott then began his address upon "The Development of Science," which we regret, owing to its length, our inability to publish in full.

Mr. Scott, in opening, expressed the doubt of his ability to deal thoroughly with the subject, because the profound learning and exalted character of the academy might well deter from the undertaking one more gifted by nature and riper in scholarship than himself. The "magnificent" structure whose corner-stone he helped lay to-day would, he said, be a monument—a Pharos—whose beams of light would not only effect the grand object of enlightening and elevating man adown the course of time, but would transmit to the latest posterity the name of James Lick as one of the greatest benefactors to science of his time.

The address reviewed the development of science, showing how, step by step, it had shattered the superstitions of the past, and predicted that it would in time, by further discoveries, destroy the superstitions of the present age. In conclusion Mr. Scott said:

"This new philosophy acquaints us with the methods of nature in effecting her works—brings us, as it were, into intimate companionship with her, so that without distrust she readily discloses those things which hitherto philosophy held to be occult.

"It enables us to measure and accurately determine the value of heat, light, motion and electricity in the known terms of foot-pounds.

"Its discoveries and inventions mark an epoch in the progress of science unsurpassed in importance by that distinguished by the immortal discoveries and inventions of Galileo, Kepler and Newton.

"In this philosophy is reached the highest development of science yet attained—eminently a unity of sciences. Other developments *may*, and not improbably *will*, be made of a still higher order. Indeed, there seems ample reason for anticipating that the Academy of Sciences of San Francisco will still further distinguish itself by its efforts in augmenting the flow of this incomparably grand and beautiful stream."

The President's Address.

The closing address of Dr. Harvey W. Harkness, president of the Academy, was as follows:

"On the 4th of April, 1853, a little band of lovers of science, seven in number, met in a small room in this city for the purpose of taking steps toward the organization of a society for the advancement of the natural sciences.

"These men were: Dr. Andrew Randall, Dr. Henry Gibbons, Dr. Albert Kellogg, T. J. Nevins, Charles Farris, Prof. T. B. Trask, and Lewis W. Sloat, all of whom are now numbered with the dead, the last to leave us being our lamented friend, Dr. Kellogg. Seldom in civil life has there been an instance where results so important have grown out of the action of a body of men, so few in number, and most of them in such humble circumstances, for these men were the founders of the California Academy of Sciences, which, after more than a third of a century of struggles and vicissitudes, comes at last in assured prosperity to lay the corner-stone of its permanent home to-day.

"The early volumes of proceedings serve to show the character of our founders and their fitness for the work they had undertaken. With but few books of reference, few types for comparison, and beset by the cares and trials incident to the unsettled condition of society, they were still able to do much good work in their various lines of scientific research. In botany, Dr. Albert Kellogg, whose love for the plants he studied was the passion of his life, has left an imperishable record as an honest and faithful observer. His merits are too well known to most of you to need recalling. Dr. J. B. Trask, many of whose notes and papers are found in our earlier volumes, was a geologist of marked ability, who, while most of the men of his day were eagerly engaged in the pursuit of wealth, was exploring valley and mountain in the interest of his favorite branch of science. Dr. Henry Gibbons, another of the seven, was a careful observer in many lines of research, and is, perhaps, best known in science in connection with his meteorological records.

"Time will not permit me to do justice to the many who subsequently became their co-workers. Special mention should, however, be made of the late Dr. William O. Ayers, who as an ichthyologist was undoubtedly the peer of any one of that period. His first paper published in our proceedings in September, 1854, together with the many which followed, prove that his was a mind peculiarly adapted to scientific research, and his description of the fishes of this coast will always take rank as models of terseness and technical completeness.

"Of the list of honorary members Drs. Torrey and Gray, especially the latter, were until the close of their lives deeply interested in the welfare of our society and unwearied in their assistance to our local botanist.

"Of the living members who were identified with the academy at an early period, a few are still actively engaged in scientific work. Dr. J. G. Cooper early contributed valuable zoological papers, and now director of our museum, still continues his labors. R. E. C. Stearns, for many years an active and efficient member, is now employed and doing good work in conchology in the Smithsonian Institution in Washington. Of Dr. Hermann Behr, who, contributing papers to the academy in 1854, is still actively engaged in scientific work, too much cannot be said in praise. In his special branch of study (Lepidoptera) he is the recognized authority on this coast, and in botany he is equally eminent. In addition to these branches of science, which would be sufficient to burden the mind of an ordinary man, the thoroughness of his early training and his extensive wide travel and varied studies make him a most valuable aid in other departments of science.

"Our limits will not allow me to make mention of those who within the last 20 years have contributed by their scientific labors to the welfare of the society, and indeed it is hardly necessary, as their work is well known to you all.

"For many years after its organization the society was much embarrassed by lack of funds, being unable even to pay the expenses of collectors, and so could not gather the material needed by specialists in their investigations, which from this cause were to often mistaken or incomplete. This was the more to be regretted as other and wealthier institutions, being able to employ agents, were eagerly collecting in this new field material of great scientific value which should have been retained within the museums of this State.

"A few years ago, however, Charles Crocker gave to the society the sum of $20,000 to be used in the promotion of original research. This timely gift has been in the past, and will continue to be, of incalculable benefit to the academy.

"Another acquisition of great importance was the collection presented by Mr. Crocker and Senator Leland Stanford. This valuable donation will, as soon as we have room to display it, be of great popular benefit, not only as a means of education for the young, but as one of the city's chief attractions.

"The meeting of the society held February 17, 1873, will long be remembered as an eventful one in our history, for on that occasion General John Hewston, as Vice-President, presented to the academy a deed from James Lick conveying the title to the land upon which this building is now being erected. This was the first intimation of his intention to furnish it material aid, although the deed was subsequently withdrawn, that he might substitute another more in accordance with the needs of the society. This generous gift was supplemented by his making the Academy of Sciences one of the residuary legatees of his estate, and from this source alone we shall at no distant day be in possession of not less than $450,000; this being in addition to the land upon which the building is being erected.

"We should be neglecting our duty if we failed upon this occasion to give expression to sentiments of gratitude to our benefactor, who has so munificently assisted us in our efforts to extend the boundaries of human knowledge.

"Truly it may be said of him that in his many benefactions he has built himself a monument more enduring than marble, and so far as it was possible for one in his position to do he has succeeded far beyond the hope of most of his fellow men in his effort to render his name immortal.

"In yonder cemetery there stands a monument, bearing upon its face the name of him who sleeps beneath—that he was born, lived and died—nothing more. His wealth, sent beyond the seas, is in possession of those he never knew, and who will soon forget that he ever lived. Lichens have attached themselves to the stone, and are silently but surely at work to accomplish its destruction, and weeds and tangle hide the neglected grave. Now and again some passer-by will stop, in an idle moment to read the brief story, until eventually the broken column disappears, and his name is lost to the memory of men.

"Here, on the contrary, is a monument to one who is gone, which, while bringing blessings to countless generations yet unborn, will preserve his name among men so long as governments shall exist to protect the property he so generously placed in our keeping."

After the address the corner-stone was laid, Dr. Harkness wielding the silver trowel, which was presented by E. J. Molera, one of the trustees.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

"AN INCH OF RAIN," explains the *Popular Science Monthly*, "means a gallon of water spread over a surface of nearly two square feet, or a fall of about 100 tons on an acre of ground."

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

Home for Children.

A lady would take care of two or three children over two years of age. A good home and very best of care in every respect. References given and required. MRS T. A. MOODY, 169 Eighth St., Portland, Or.

406,843.—SAFETY DEVICE FOR ELEVATORS—E. Lainesse, S. F.

406,528.—MAIL POUCH—C. W. Miller, Clifton, A. T.

406,661.—BICYCLE Edwin Mohrig, S. F.

406,547.—TOASTER—C. T. Tarpenning, Los Angeles, Cal.

406,489.—TELEGRAPH KEY — H. A. Waldo, Reno, Nev.

406,801. -RAILWAY GAGE AND TIE GRIP—Washburn & Krengel, Independence, Ogn.

The following brief list by telegraph, for July 18th, will appear more complete on receipt of mail advices:

California Hower H. Allen, Oceanside, rest for buggy top; Edward L. Burgein, Los Angeles, pipe bender; Oliver Cope, assignor of one-third to J. Otis, San Francisco, cable railway brake; Howard P. Garland, San Francisco, making rollers for jute silvering machines; Will C. J. Howard, Mariposa, assignor of one-half to J. W. Farmer, San Francisco, squirrel poisoning machine; James T. Mahew, Vista, fence; Stephen Strange, Los Angeles, mail-bag rack and distributing table; Julius H. Von Schmidt, San Francisco, hydraulic dredging machine; William Wallace, assignor of one-half to himself and R. C. Braun, San Francisco, sewer-gas top and sink; William J. Wright, San Francisco, ruler.

Washington Territory—Arthur M. Leighton, assignor of one-half to J. H. Livermore, Port Townsend, boot or shoe last.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LIFTING JACK.—J. P. Hays, North Temescal, Temeda county. No. 406,523. Dated July 9, 1889. This patent covers, in a lifting-jack, the combination of a standard, a lift vertically movable thereon, a lever connected with the lift, and a clutch connected with the lever and vertically movable upon the standard, said clutch being connected with the lever and forming, when engaging the standard, the fulcrum for the lever and support for the lift.

FENCE-MAKING MACHINE.—Thos. L. Armstrong and Edward Clark, Oakland, assignors to the Union Fence Manufacturing Co., of S. F. No. 406,516. Dated July 9, 1889. This invention relates to that class of machines which are used for making what is known as "slat fence," consisting of parallel spaced slats united by wires which are twisted between the slats and form loops for confining them. The patent covers certain details of improvement in these machines. A suitable number of turns is imparted to the twister heads, which heads, by reason of their construction, clutch or grip the wires to such an extent as to place them under proper tension, preventing them from unduly slipping through, a tendency which is common to them, and which makes them bow over the slats instead of twisting snugly thereon.

BICYCLE.—Edwin Mohrig, S. F. No. 406,661. Dated July 9, 1889. This improvement in bicycles consists in jointing or connecting the front and rear portions of the frame and the lower end of the seat standard, and in the connection with the front and rear portions of the frame of an elastic spring, whereby an independent vertical movement of the wheels is allowed. This improvement is on the "safety" type of bicycle. Any roughness or obstruction in the road will be surmounted by the front wheel, the elasticity of the coil allowing the front wheel to rise, while the weight of the rider is supported upon the joint about which the motion takes place. When the rear wheel passes over the same or other obstruction, the elasticity of the improved spring will be sufficient to allow this wheel to rise and relieve itself as it passes over the obstruction. The construction is equally applicable to the frames of tricycles.

PRUNING SHEARS AND FRUIT-PICKER.—Byron Jennings, San Jose, assignor to C. W. Breyfogle and F. L. Voorhies. No. 406,524. Dated July 9, 1889. This improved pruning-shears and fruit-picker consists of the usual fulcrumed opposing shear-blades, with the opening spring and handles by which they may be operated, and in combination therewith of an elastic rubber block having the ends only held in clamps, which project over said ends and are formed upon and as a part of the shear-blade itself. An especial advantage of this device is in the use of open clamps near each end of the rubber block, which, while holding it firmly in place against pressure, will allow it to be instantaneously removed and replaced when necessary, and by reason of the space between these clamps the central portion of the rubber block is allowed to spring or arch upwardly whenever a stem or limb of considerable size is to be cut. The freedom of the center portion of the rubber to move is an improved feature of the invention, since it enables it to accommodate itself to limbs of various sizes without being removed and without readjustment.

The Davidson Steam Pump.

We call attention in this issue to the Davidson steam pump, of which the Risdon Iron & Locomotive Works of San Francisco have the exclusive agency for this coast. From their Eastern agents they learn that the Spreckels sugar refinery of Philadelphia is now having built six Davidson pumps, of the plunger pattern, 18-inch steam cylinder, 14-inch water cylinder, 24-inch stroke, four pumps, 12 inch steam cylinder, 10-inch water cylinder, 24-inch stroke, of the piston pattern, and two Meltu pumps 18-inch steam cylinder, 12-inch water cylinder, 24-inch stroke.

For the Brooklyn Water Works, a triple-expansion pumping engine, with steam cylinders, 9-inch, 14-inch and 24-inch, water cylinder 24-inch and stroke 24 inch, steam pressure 100 pounds.

They are also setting up at the water-works station of the Laconia & Lake Village Water Co., Lake Village, N. H., a pair of compound-pumping engines, steam cylinders 14-inch and 26 inch, water cylinders 13-inch, stroke 24-inch; these pumps are constructed so as to work as a pair of duplex pumps, or as two single pumps working independent (the change can be made while pumps are running or at rest); this is a patented feature of the pumps; it saves the wear and tear on one of the pumps when one is able to do the work; or in case of a breakdown on one of the pumps, it does not necessitate the shutting down of the other. Four pumping engines, plunger pattern, are working under this principle at the Brooklyn water works, steam cylinders 26-inch and 48 inch, water cylinder 24-inch, stroke 36-inch; there is also a pair of plunger pumps at Fall River, Mass., same principle, steam cylinders 26-inch and 48-inch by 22-inch water cylinder by 36-inch stroke.

A pair of compound sewerage pumping engines, steam cylinders 10x20x14 inch, water cylinder 24-inch stroke, is now being built to work single or duplex. These pumps are for Framingham, Massachusetts; also a pair of pumps for Milford (Conn.) Water Works, to work single or duplex, size the regular No. 10 pressure pump; also two No. 9 and two No. 10 and two No. 12 regular pressure pumps, to work single or duplex, for elevator duty. Two pumps for the Weideman Silk-Dyeing Company, Paterson, New Jersey, steam cylinder 24x22 inches and water cylinder 24-inch stroke; a duplicate order from the North Attleboro Water Works, North Attleboro, Massachusetts, for pumping engine, steam cylinders 18x34 inches by 15-inch water cylinder by 24-inch stroke, piston pattern; order from the Pennsylvania Steel Company for two pumps, 14-inch steam cylinder by 14-inch water cylinder by 18-inch stroke; Morgan Iron Works, New York City, for a No. 4 and No. 9 pressure pump and six evaporators—four 4000 and two 6000 gallons in 24 hours—for six steamships building by them; a pair of compound boiler feed-pumps, steam cylinders 8x13 inch by 7-inch water cylinder by 12 inch stroke, with air-pump and condenser, for electric-light plant, Brooklyn; two No. 12 distillers for Cramp & Sons, Philadelphia; four pumps for the U. S. S. "Concord and Bennington," steam cylinders 14-inch, circulating cylinder 18-inch, and two air cylinders 18-inch and bilge cylinder 4-inch.

A gold medal was awarded this pump by the Massachusetts Charitable Mechanic Association, one of, if not the oldest, of its kind in this country. Money cannot buy a gold medal from this association, merit alone secures it, and it was won from a large number of exhibitors of steam pumps.

The Brooklyn Water Works have nine of the Davidson pumping engines. The Risdon Iron and Locomotive Works have constantly on hand a full line of all the various sizes of these pumps ordinarily used.

ACADEMY OF SCIENCES.—At the meeting of the Academy of Sciences on Monday evening last, T. S. Brandigee described a number of plants observed by him during a visit to Lower California. P. S. Buckminster presented a large collection of plants, collected in the foothills of Fresno county. The trowel with which the corner-stone of the new Academy of Sciences was laid was received and exhibited. L. Belding presented 11 specimens of small thrushes, two types of which were the Big Tree thrush. Chas. Frebig of Eureka presented a loon captured in Humboldt bay. W. W. Price added two Rocky Mountain chipmunks, an Oregon mole, one common chipmunk, and one striped squirrel. A sandpiper and two European finches were received from F. O. Johnson. A specimen of Amblystoma, a species of salamander, was given by Dr. Behr, and 140 specimens of insects were received from Carlos Troyer.

Change in the Parke & Lacy Company.

Lyman C. Parke of the Parke & Lacy Company, having decided to retire from active business, has sold his entire interest in the corporations controlled by Parke & Lacy. These include the Utah & Montana Machinery Co., in Salt Lake, Utah, and Butte, Montana; the Parke & Lacy Machinery Co., Portland, Or., and Parke & Lacy Co. of this city and Sydney, New South Wales. Mr. Parke's interests have been purchased by his partner, B. T. Lacy, who will continue the business as heretofore.

We congratulate Mr. Parke on being able to retire and enjoy the fruits of his labors. The firm started on a very small scale and with no large amount of capital. They secured a number of valuable agencies and very soon succeeded in building up a large business in San Francisco. Finding then that the mining field was widening to the northwest, the other branches were established, and these have been uniformly successful also. The Sydney, N. S. W., house has been the means of introducing American machinery in that colony, particularly that relating to mining and wood-working.

The firm of Parke & Lacy introduced to the mining regions of this coast many of the best-known machines for saving labor. It has also accomplished a great deal toward the saving of precious metals with machines for pulverizing, concentrating and amalgamating. At this time the firm is meeting with good success in introducing the same class of machinery in the Australian colonies and the U. S. of Colombia. They have here a fine large building specially designed for their business. Mr. Lacy, on whom the entire management of affairs will now devolve, is a practical man with an intimate knowledge of mining and mining machinery, thoroughly posted on the needs of the coast. He has spent much of his time in the mining regions among the mills and reduction works, but will hereafter devote himself more to the general management than to carrying out details, having a good corps of skilled and practical assistants for that branch of business.

Como, Nevada.

EDITORS PRESS:—The Eureka Como has stopped pumping and are working only above water level, where they are taking out some good ore. The Rapidan is finding some very rich ore, and have just had a 50-ton lot of fair-grade ore milled. There has been a new find made on the Buckeye recently, assays from which go $300 to $1000 per ton, mostly silver. Nearly all the ore in this camp is silver ore, and the heavy discount is a great drawback. There is high-grade ore being found in more different places in the district than ever before, yet the camp languishes for the want of capital to develop it. There is certainly rich ore in paying quantities here, and some day some company with the necessary courage and capital will have the good fortune to uncover it.

The water in the Carson river is so low that all the mills depending upon it have had to close down about a month earlier than last year. S.

ALASKA MINING PATENTS.—Up to 1888 only four patents in all Alaska had been applied for, and those embraced the claims comprising the famous Treadwell group, the patents for which were issued by the Government early last year. During 1888 97 applications for patents for mineral ground and seven for mill-sites were made on the Douglas island mineral belt and the Basin mineral belt. It is safe to estimate that at least $2,000,000 have been expended on the Douglas island mineral belt since its discovery in the way of improvements and development work.

THE eight copper companies controlled and having their headquarters in Boston, including the Calumet and Hecla, paid $1,650 000 in dividends for the first six months of 1889, against $1,060,000 in the corresponding period last year.

MILK GLOBULES.—Some one who has never counted them avers that the average globules in a quart of milk is about 2,000,000,000,000.

The Ruby Mines of India.

These mines are located about 50 miles north of Mandalay, the capital of Burmah, and are the only source of first-class rubies in the world. These gems are found in the layers of gravel and earth and also in the clefts of the magnesian limestone, which is the matrix of the ruby.

The late King of Burmah formerly got a yearly revenue of 50,000 Rx. from them, but in consequence of wasteful working and extravagant management, the returns have been greatly diminished the past few years.

These mines have recently been incorporated in London under the name of the Burmah Ruby Mines Co., Limited, in which the Rothschilds are said to hold a controlling interest. The new company propose to put in the most improved mechanical appliances and work them in a much more extensive and systematic way.

The specific gravity of the stones is about four times that of quartz, so that it is not difficult to save them by washing, and the California system of sluicing is now to be adopted. Another California invention has also found place in the new system of working—the Pelton water wheel, four of them having recently been ordered for running pumps, hoists, electric lights, etc.

This shipment goes West via China and Calcutta, and is expected to reach its destination in about 60 days. Should a California traveler chance to visit these mines, he would be greeted with the familiar hum of the Pelton wheels, strongly reminding him of home, as also of the fact that the fame of California's most illustrious invention has gone around the world.

SHASTA COUNTY MINES.—A dispatch from Redding says: The biggest sale of mining property in the history of Northern California is now being negotiated between William T. Coleman and an English syndicate. Abstracts of title to a group of 60 mines, 20 of which are patented, are under way. It is reported that the purchase price is in round numbers $2,000,000. These properties have been in the name and under the control of a corporation known as the Niagara Mining and Milling Company. The Niagara, the leading mine of the group, is generally regarded as a good piece of property, and has been worked for several years. It is stated that the new owners will work the Niagara and other mines on a large scale.

PROSPECTING THE DESERT.—An expedition to explore and prospect the country along the new Utah railroad from Frisco in Utah to the Needles on the Colorado, will soon take the field. Mr. W. F. Leon of the Nevada and California Mining and Trading Co. left on Saturday to take charge of the work. The center of operations of the party will be at the Needles, and abundant supplies have been laid in at that point. New stations will be established at various points from which food and water supplies can be drawn, and the country will thus be thoroughly prospected.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

CARBON PAINT.

CARBON PAINT CO. TRADE CP MARK SAN FRANCISCO, CAL.

The most durable and effective Roof Paint in the world is now for the first time offered for sale in this market. A practical trial of it of over five years, in States and Territory where the right to manufacture it under our patent has been sold, demonstrates that for shingle or tin roofs, wood or iron bridges, underground pipes, etc., it is the best and most durable paint yet discovered. It never cracks under any extremes of temperature, and it is guaranteed *never* to rust or corrode any metallic surface. As a protection against salt water it defies competition. Neither acid nor coal smoke affects Carbon Paint, and as it requires nearly a ree heat to destroy its protective qualities, it is peculiarly adapted for Fire Engines, Smoke-stacks, etc. Good, responsible Agents wanted throughout this coast. Liberal terms offered. Send for Circulars.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

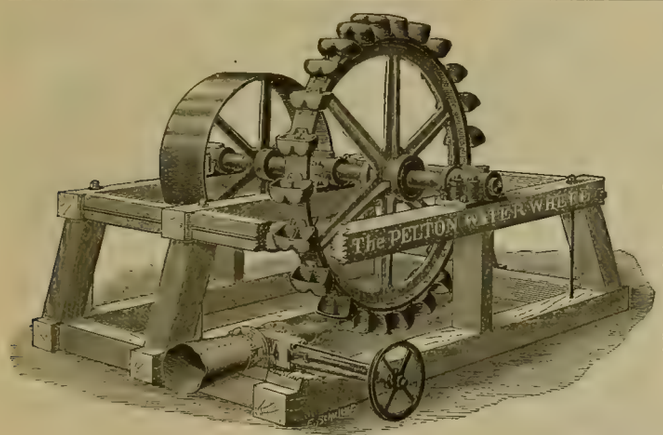
JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.



Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JOHN W. QUICK, Proprietor.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 18, 1889.

Trade the past week was quiet in all branches, except hardware. The latter has been quite active for the past four months, which goes far in confirming reports of a steady increase in the improvements going on on this coast. Interior merchants continue backward in ordering goods: the buying appears to be confined to assortment orders. It is claimed that when stocking up does set in a large trade will be had in all branches of business.

In the local market, money continues easy. While there are many who complain, yet a quiet but thorough canvass of the situation convinces us that today there is more available coin in this city than for several years past in the month of July. So far as ascertainable, all legitimate trade wants are met by banks, but for other purposes there is some friction in getting funds unless upon the best of security. The commercial banks in this city show a fine record for the past fiscal year. The profit and loss accounts of each and all are on the right side of the ledger. The condition of the San Francisco savings banks on the first day of July is shown by the following figures, compared with the statement of the same time a year ago:

Resources.	1888.	1889.
Bank premises	$478,106	$740,606
Real estate by foreclosure	1,004,778	965,535
Invested in stocks & bonds	17,247,091	15 306,340
Loans on real es ate	44 128,588	53 343,703
Loans on stocks and bonds	6,438,848	6,437,546
Loans on other securities	10,000	16,000
Money on hand	1,624,977	2,106,167
Money in other banks	555,251	828,529
Other assets	194,664	156,457
Total assets	$71,580,307	$79,960,884
Liabilities.		
Capital paid up	$2,326,230	$2,863,333
Reserve fund	2,637,241	2 651,976
Due depositors	66,279 449	73,959,124
Other liabilities	337,387	486,451
Total liabilities	$71,580,307	$79,960,884

The above shows a gratifying increase in the deposits, loans effected and money on hand.

Sterling exchanges are weaker, in sympathy with the East, where bills are beginning to be offered more freely. It is claimed that the exports from this country in cereals, cotton, meats, etc., will, from now on, be quite heavy. English and other Europeans are in the market at the East picking up American securities, owing to their offering safer investments in case of war abroad.

In the speculative markets it is reported that a deal is on in, or will soon be in powder stocks. Other local securities rule so high that they do not offer much inducements to operators. In cereals there is more doing in futures. Mining stocks have been more active, but as yet the outside moneyed public appears to be afraid of them.

MEXICAN DOLLARS—The market in sympathy with silver and lower sterling exchange is lower. Buying for shipment to China is reported from first hands at 74½ cents for new.

SILVER—The decline in sterling exchange is against the market, that is, the difference between us and the New York market is not so much. Sales in our market the past week ranged from 92¾ to 92½ cents according to the necessity of buyers. Advices from the mines are without essential change. Receipts in this city are only fair. The last Government reports at hand report there was on hand in siver coin and bullion $283,655,933, against which there was outstanding in certificates $258,166,348. This shows that the silver certificates are going into circulation quite freely.

QUICKSILVER—Receipts the past week aggregate 291 flasks, and exports by sea, 100 flasks in transit for Mexico. The demand is fair for the season. In sympathy with the foreign markets, ours shows considerable strength at quotations.

LIME—Receipts the past week aggregate 4350 barrels. The exports by sea were light, aggregating only 100 pounds to Honolulu. The market is steady, with a good demand ruling.

BORAX—Receipts the past week aggregate 1300 ctls. The market is without essential change. The output appears to be regulated by trade requirements.

TIN—The market is barely steady, with buyers only tempted by concessions. The continued shading off of the English market is against buyers for shipments. London advices report tinplate on July 10th at 13s; pig 3 months futures, £89, against £89 12s 6d on July 5th, and £82 on July 11th, 1888.

COPPER—The market is still unsettled, pending better arrangements between the leading companies at the East. The consumption is reported to be quite large, although the demand is said to be slower, owing to the fears that lower prices will obtain. London advices July 10th quote as follows: Chili and G. M. B. spot £41, futures £40, against on July 5th, spot £41 12s 6d, futures, £41 15s.

LEAD—The market has ruled weak at unchanged quotations. Now that the Treasury has made a new ruling regarding Mexican ore, it is thought that a more stable market will soon set in.

IRON—Imports the past week aggregate 805 tons of foreign pig. It is claimed that our market is shaping itself more in favor of holders. The stock in first hands is quite light as is the quantity on passage. Consumers are also lightly stocked. It is generally claimed that when buyers are forced into the market for more liberal supplies, prices for spot will be marked up. The following is a comparison of London quotations:

	July 12, '89.	July 13, '88.
Eglington	44s	37s 6d
Glengarnock	52s	42s 9d

COKE—Imports the past week aggregated 1643 tons. As this was all sold to arrive and goes into immediate consumption, it has no effect on prices, which hold strong at quotations.

COAL—Imports the past week aggregate as follows: Coos bay, 1980 tons; Nanaimo, 634; Australian, 8946; Tacoma, 4000; Seattle, 1500; Departure bay, 4700. Total, 21,230 tons. The local demand shows more activity, owing to dealers having more confidence in the stability of prices well up to the end of the year. Many families and other small consumers are laying in their winter supplies. Large consumers are still offish, under the impression that there will not be any material advance in prices, while there is a strong probability they will recede after the turn of the year under free arrivals of vessels for wheat loading. We are unable to hear of any sales for shipment; the asking price is still $7 for Australian.

Eastern Metal Markets.

By Telegraph.

NEW YORK, July 18, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 3-16	92¼	$11 85	$3 87½	$19 26
Friday	42 3-16	92½	11 85	3 90	19 70
Saturday	42½	92	12 00	3 90	19 75
Monday	42½	92	11 90	3 95	19 80
Tuesday	42 1 16	91¾	11 90	3 87½	19 80
Wednesday	42 1-16	9.¾	.....	.....	.....

NEW YORK, July 15.—Borax is firm, on moderate supply. Refined, 9¾@9¾c; powdered, 8¾@9c; concentrated, 7¾@8½c. Quicksilver, 65@66c, supported by an active London market. There have been liberal arrivals of copper, mainly Calumet and Peta. There is no quotable change in spot. Considerable was taken for export at equal to 11@11¾c, free on board. Consumers pay 12@12¾c, car lots to small quantities. At Baltimore pig lead is quiet at $3.90@3.95. Consumers seem well supplied, and the deferred decision about Mexican ore checks speculative interest.

Mining Share Market.

The bears and bulls have had a slightly livelier time in the pit of the two exchanges. The movements in the Comstocks have been sharper, with Ophir and Best and Belcher the leaders. What the activity was grounded on is, as yet, a mystery, outside of the reported improvement made in last week's MINING AND SCIENTIFIC PRESS. To an outsider it looks like purely unadulterated manipulation; but whether to sell stocks or get in stocks remains to be seen. It also looks as if the activity is made so as to send prices to a still lower level before much of an upward move is made. The bears continue in strong force, and unhesitatingly affirm that there is nothing in the mines to warrant higher prices. They also point to the fact that if there was, Col. Mackay would not have gone East. The bulls, whose numbers appear to be growing beautifully less, affirm that Col. Mackay's going East was evidently done to depress the market so as to buy in more stock. They also believe that the situation in the Gold Hill and Middle mines is becoming more interesting each day, and that quite a decided improvement in one or more of the mines is liable to occur any day. The Alta group of mines are attracting more attention, but so far as we can learn, outside dealers, while watching them more closely, touch the stocks, as yet, rather gingerly. Occidental stock has held steady the past week, with only fair trading reported. In outside stocks the Quijotoas have remained lifeless. The Tuscaroras have made spasmodic efforts at a recovery, but the general public appear to be afraid of them. The Bodies made another of their cat-like moves—jumped up about 30 per cent, only to drop down again like a lump of lead. What the move was made on, or for what purpose, no one appears to know. Eureka Consolidated sold at $1, with $1.25 bid, assessment paid.

From the Comstock mines there is nothing new to report. The official letter received to-day (Thursday) from Crown Point is more encouraging. From the other mines private advices are very hopeful of better results soon in some of the more promising. Prospecting and other work in all the mines is being vigorously pushed, as if it is the determination of the managements to find good paying ore if it is to be found. Col. Mackay, before leaving for the East, succeeded in getting a dollar a ton reduction in the milling of ore by the Morgan and also by the California Pan mills. The price is now $6 a ton instead of $7. The Nevada mill will also reduce their milling charges to $6. The other mills, it is said, will fall into line and make a dollar a ton reduction for milling ore. It is said that a movement is on foot to reduce water and transportation charges. The high charges is what the Mining Stock Association of this city has been consistently fighting ever since its organization. From the Tuscarora district the old, old story of rich ore, etc., continues to come to hand. From the Bodies we are unable to obtain any reliable information, and until we do, it is a waste of time to give street rumors, evidently put out for stock manipulation purposes. From the Quijotoas there is nothing of an important character received outside of the official reports. The market opened this morning weak and dull for the Comstocks. The only strength shown was by the Bodies, but few have faith in their stability.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

STATE BUSINESS MEN'S ASSOCIATION, July 16. Object, protecting business men in extending credit, and to establish bureaus of information. Directors—Albert Debicke, James M. Troutt, W. R. Matthews, H. N. Adams and E. L. Henry.

TAMALPAIS LAND & WATER CO., July 17. Capital stock, $40,000. Directors—Joseph G. Eastland, Lovell White, Thomas Magee, Louis L. James and Henry C. Campbell.

THEOSOPHICAL SOCIETY AND UNIVERSAL BROTHERHOOD, July 17. Object, to promote the study of Aryan and other Eastern literature, religions and sciences, etc. Directors—Allen Griffithe, Jerome A. Anderson, Charles H. Sykes, Theodore G. Ed. Walleb, Edward B. Rambo, Sarah A. Harris, Elizabeth Price, Marie A. Walsh, J. Emmett Smith.

SUTTER COUNTY has brought its first direct case against a hydraulic mining company—the Plumas Consolidated of Plumas county—to show cause why the company should not be punished for contempt for violating an injunction.

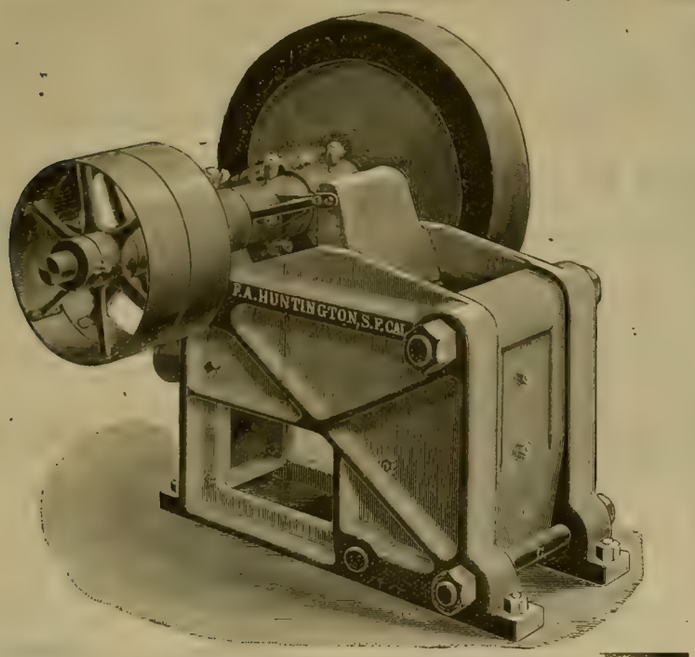
Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco, Cal.

By C. H. AARON.

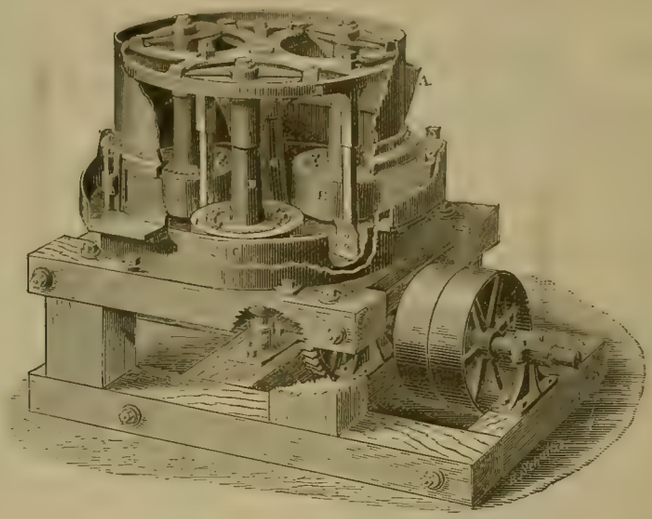


AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & CO., S. F.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

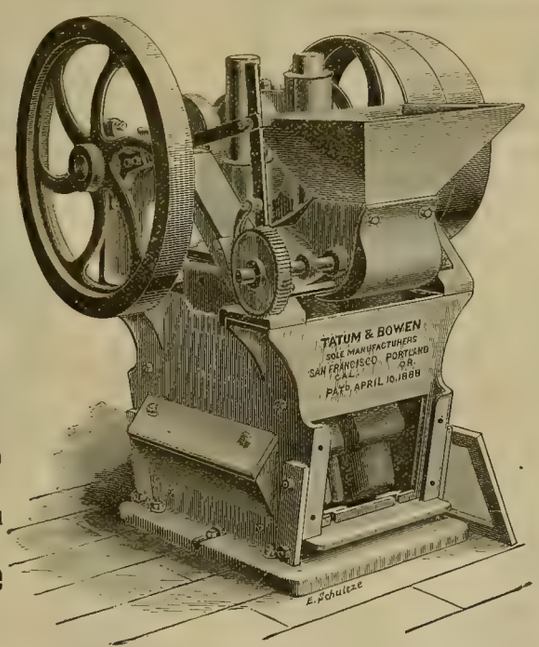
The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.



The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

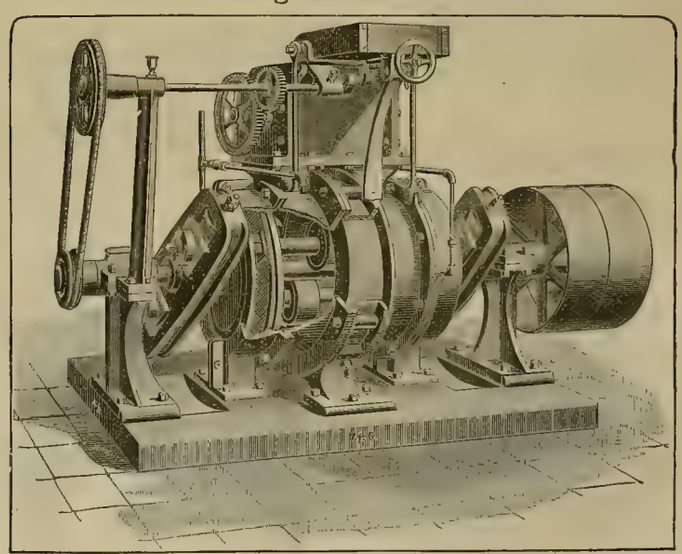
The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:



TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,
AND PORTLAND, OREGON.

MANUFACTURERS OF MINING AND SAW MILL MACHINERY.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

PACIFIC IRON WORKS

1850. 1888.

—BUILDERS OF—

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

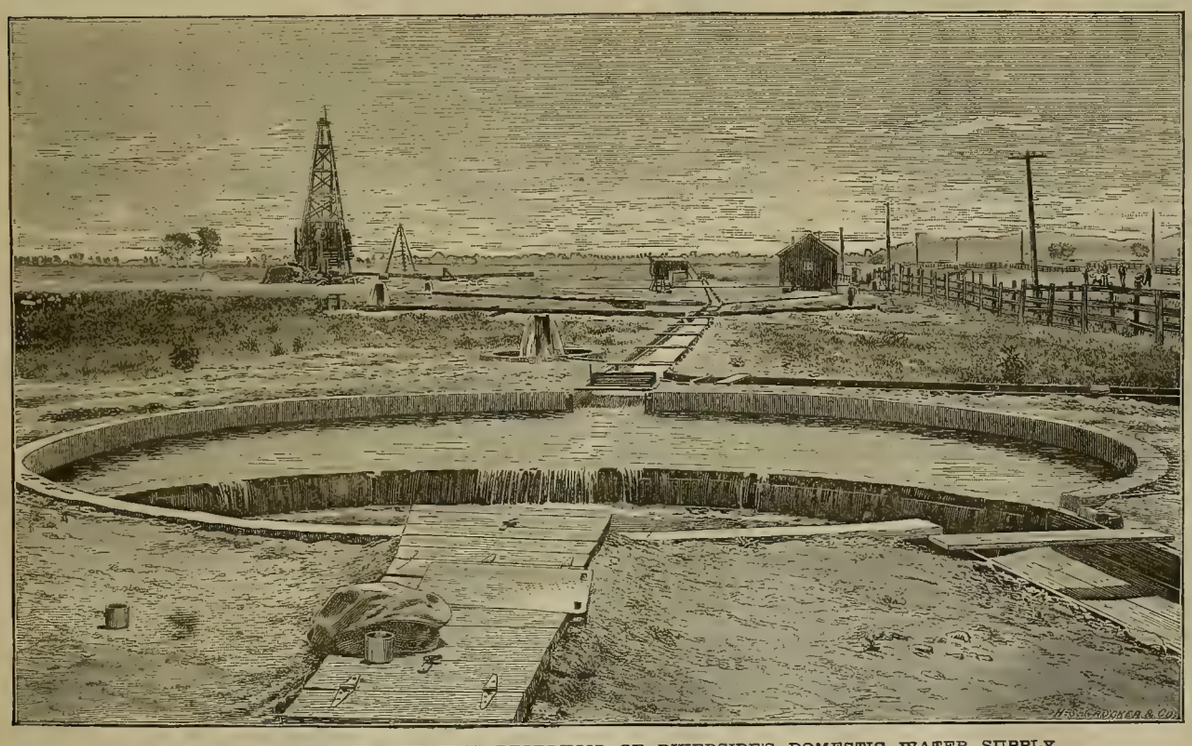
Artesian Water Supply.

Owing to the peculiar climatic conditions in this State, where we have a rainless summer, the questions affecting the water supply of cities are of great importance, and differ materially from those in other places. Artificial reservoirs ar numerous. The rain-waters of winter and those from the melting snows in summer are retained for use as occasion demands during the dry season. In the southern part of the State, where irrigation is practiced, contrary to the custom of the eastern portion of the continent, water is regarded as of the first importance, and land second. In fact, in some places their relative value is as three to one. Some of the best semi-tropical fruit-growing sections are in arid districts, where the rainfall is exceedingly limited and irregular, and it is absolutely necessary to supplement the rain of winter with copious and frequent waterings during summer. Where there are "artesian belts," of course, such supplies are utilized, and lands in the vicinity are held at high prices.



FLUME ON THE GAGE CANAL ACROSS ARROYO SECO CHIQUITO, RIVERSIDE.

In cities and towns in those sections of the State referred to, the water supply for domestic use and irrigation purposes both demand attention. That used for irrigation is frequently unfit for any other purpose, and where it is possible the two systems are kept separate.

At Riverside, San Bernardino, this arrangement has been carried out very successfully, as appears from a pamphlet issued by the Board of Trade.

Water for domestic use is taken from artesian wells upon lands owned by the Riverside Water Co., about eight miles distant, and nearly 200 feet above the general level of the city. From the wells the water is turned into a reservoir of concrete, with a partition, over which it is compelled to flow for the purpose of aeration, and thence through wrought-iron pipes of sufficient capacity to deliver some 3,600,000 gallons daily. The water from these wells is pure and soft and passes directly to the houses of consumers without any chance for contamination. The sketch on this page shows very clearly the arrangement of these wells and reservoir.

ARTESIAN WELLS AND AERATING RESERVOIR OF RIVERSIDE'S DOMESTIC WATER SUPPLY.

The water used for irrigation in and about Riverside is brought in by systems of canals, flumes and open distributing ditches. The water for the canals of the Riverside Water Co. is from the Santa Ana river and one of its tributaries, Warm creek. During the irrigating season the entire flow of the latter stream is taken up before it reaches the river and is conducted through an immense flume two miles in length across the valley of the Santa Ana river, and, after passing through a tunnel, drops over a 40-foot fall into the upper canal of the company, creating a fine water-power at this point, now principally used in generating electricity for lighting the cities of San Bernardino, Colton and Riverside. The capacity of these ditches is enough to irrigate from 25,000 to 30,000 acres of land.

Among other systems for irrigation is the Gage system of canals, which irrigates some 12,000 acres of land. Mr. Gage owns 2400 acres of land, nearly all within the

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Copper Mines of Calaveras County.

Union Copper Mines, Copperopolis.

EDITORS PRESS:—I visited these mines about a year ago, and at that time wrote up their history. Then the object of the owners was to overhaul the property and put it in working order after its 18 years of idleness, in view of a contemplated sale. This was on the eve of the boom in copper; now that the bottom has dropped out of copper, I expected to find the property in its old-time idleness. Judge, then, of my surprise when I saw that the entire plant was being put in shape on a scale sufficient to extract and handle 300 tons of ore a day. Mr. J. H. Ferson, the superintendent, in exploring the old workings, saw evidences of copper ahead and drove into the country beyond, which was supposed to be barren, and here found copper ore high in grade and unlimited in quantity. In consequence, the owners were not slow in deciding to work the property.

By Mr. Ferson's plans the property is now ready to resume operations on a scale of 300 tons in 10 hours, making it the most extensive copper plant in the State.

Gov. F. L. Ames of Massachusetts is the principal owner, who, with the other owners, have expended over $2,000,000 on the mines. The property is over a mile in length on the vein. The developments are extensive, extending to a depth of 500 feet on the vein. Ten shafts of an average depth of 400 feet have been put down on the course of the vein. From these shafts levels have been run on the vein of various lengths up to 600 feet. These workings show the vein to be from 5 to 40 feet in width, with 100,000 tons in sight. There is on the dumps at this time 120,000 tons of second-class ore, the accumulations since 1861. This ore did not carry sufficient copper to make its shipment profitable, the average being 6 per cent under the present plant. All of this ore can be converted into copper cement at a good profit.

Up to May, 1889, the ores were sorted. That giving 15 per cent and over of copper was sorted and shipped to New York for treatment; all below 15 per cent was piled on the dumps. The output of the mines from 1861 to 1888 was 70,000 tons of high-grade ore, while over 100,000 tons of second-grade accumulated on the dumps. The low price of copper then closed the mines until 1887, when Mr. Ferson took charge, and soon opened up ore bodies exceeding in size and value those of the mines' early history. Stimulated by the rise in copper, the old plant was made to produce from Nov., 1887, to May, 1889, 5000 tons of high-grade (15 per cent) copper ore, which was shipped, while 10,000 tons of ore less than 15 per cent was added to the dumps. All of the ore bodies opened in the mine that gave less than 15 per cent were allowed to stand. In March, 1888, Mr. Ferson made a trial roast of 300 tons of second-class ore, giving the ore a five-months' roast. The results were so satisfactory that the company at once stopped shipments and instructed the superintendent to construct a plant that would treat all of the ores at the mines. Mr. Ferson's plant is now complete, and in simplicity of process, satisfactory results, and absence of theoretical expense, leaves nothing more to be desired.

By the present plant the ore is hoisted from the mines in self-dumping skips which discharge on to screens, the finer ore falling immediately into bins. The coarser ore is fed to rock-breaker, and in turn falls into bin. From these bins cars of 3½-ton capacity are filled by means of ore chutes. Three cars are then drawn by a horse on to the elevated trestles. Under these are piled cord-wood in heaps 350 feet long by 20 feet wide, one foot in depth. On to this wood coarse ore is dumped to a hight of five feet; over this is placed three feet of finer ore. The sides and top of the ore pile are then covered with waste or earth which must be entirely free from sulphur to prevent too rapid combustion and keep the fire under control by means of side flues and ventilating chimneys. The wood is then fired, and the ores, by reason of the sulphur contained in them, burn for a period of six to eight months. The slower or more protracted the combustion the greater the per cent of oxide of copper converted into a soluble sulphate. The roast completed, the surface covering is removed and the roasted ore shoved on to an adjoining leaching floor constructed of tight boards, covered with mastic roofing of three-ply tarred paper, coated over with a paint of coal tar and asphaltum. This floor is given sufficient pitch to make it drain and to further facilitate the flow. Small drains built of coarse rock are laid at regular intervals. The ore piled on to the leaching floor, water is then carried on to the pile by pipe and distributed over the surface by hose and sprinklers. The salts of copper being soluble in water form a solution of sulphate of copper. This solution, as it flows from the bottom of the piles of ore being leached, is led into long sluices filled with iron scrap. Here the saturated solution of sulphate of copper attacks the iron, converting it into a sulphate of iron, dropping the copper as a metallic powder, called "copper cement," carrying 80 per cent of copper. This is dried and sorted for shipment.

Once the leaching plant is well under way, a 50-ton water-jacket copper smelter will be added to the plant for the reduction of the ores carrying 12 per cent and over of copper, all below leaching. A large amount of the ores carry 20 per cent of copper, thus bringing the average up to 12 per cent. When in full operation, the works will produce eight tons of copper every 24 hours, worth at present valuation about $1200.

To describe the company's store, hoists, houses, shafts, large ore bins, system of tracks and the extent of the plant, would require greater space than could be given it in one issue of the PRESS. Suffice it that while there is nothing on the mines of a theoretical or ornamental character, there is nothing omitted that will add to the plant's output, reduce the expense, and increase the value of copper produced. The plant is almost automatic in its operation, and will well repay a visit of inspection by those interested in copper. Mr. J. H. Ferson, the superintendent, and Mr. H. D. Ranlett, the manager, have here brought to perfection a plant the result of their long years of experience, gained in practically working copper ores.

Camp Seco.

On my visit a year ago, I called at the Penn Chemical Works, C. Berger superintendent, a "close corporation." I have no reason to change my opinion formed then, unless it would be to now call it the "closed corporation." The superintendent being of that class that believe in "obeying orders if it breaks masters," acting under instructions, declined to give any information, and in consequence I can state but little in regard to the mine. At present the superintendent is confining himself to roasting and leaching the ores extracted, the mine being idle. This is the only plant in the State working on the latest ideas in copper metallurgy, producing block copper .98 fine. The plant is both extensive and expensive, the large amount of ores in course of roasting and leaching being sufficient to keep up a large output of copper cement for years to come. While I am not at liberty to describe the methods employed, I am confident that if the seal of secrecy were removed from the amiable superintendent's lips, he would willingly contribute his share of knowledge in the treatment of copper ores in the light of all the knowledge of the present day. Adjoining the Penn is

The San Francisco Copper Co.,

R. W. Enos superintendent. This company is confining itself at this time to roasting and leaching the ores previously extracted, the mines being idle. The copper cement produced is exceptionally high in its per cent of copper, the output of copper cement in the past four months being:

	Pounds.
March	41,844
April	37,360
May	56,915
June	57,710

Under Mr. Enos the quantity is increasing and the per cent growing higher, while the discharge water does not give a trace of copper, thus showing that the copper is all saved.

That these are the only copper mines in Calaveras is owing to a want of prospecting on the Serpentine belt on which the copper is found, as this belt extends across the county and is only awaiting capital and development to show other copper deposits of equal size and richness.

E. H. SCHAEFFLE, Ex-U. S. M. E.

Murphys, Cal., July 20, 1889.

Fragments of a Comet.

Edward S. Holden, director of the Lick Observatory, under date of July 18th, says: From measurements made by Mr. Barnard last night upon the comet discovered by him in September last, the following statistics regarding it may be deduced, and, thinking that they may interest some of your readers as well as ourselves, I quote them here:

As I have said in a previous note, this comet, which is now a long way past its perihelion, has lost all signs of the tail which it had when nearest the sun. No doubt the effect of the sun's action upon the head of the comet has become so small at its present distance (253,000,000 miles) that the head is no longer forced to give out those streams of matter which showed to us as the comet's tail; but the comet was subject to immense strains and stress in passing through that part of its orbit nearest the sun, and it is now showing the effect of the forces in the following way: Its body is evidently becoming disintegrated, and the fragments are seen to be streaming behind the comet in the form of a tail directed not from, but toward, the sun.

This mass of matter was measured by Mr. Barnard on July 16th, and his measures show that its least possible length is 430,000 miles, and its least possible diameter is 144,000 miles, so that the fragments which have already broken off from this comet represent cubic contents of at least 70,000,000,000 of cubic miles. The comet itself, which is 165,000,000 of miles from the earth, is still fairly bright, and were it not for the fragments which are seen to follow, it would seem to be in a perfectly normal condition. As it is, we know it must have lost an immense quantity of its original substance.

This is an interesting case to astronomers, as it shows almost palpably the effect of the enormous forces to which every comet is subject at the time of its perihelion passage, and the whole phenomenon forms an interesting commentary on the text that comets, even the stoutest of them, must be short-lived things.

Imported Silver Ores.

The New Treasury Regulations.

Secretary Windom has taken a middle course in the matter of imposing a duty on silver ore containing an admixture of lead. He has not decided at all the question of duty presented to him, but has issued a new set of regulations for the treatment of the ores at the frontier. A circular letter embodying these regulations has been dispatched to the Collectors of Customs at El Paso, Eagle Pass and Laredo. It stated that it is not intended to prejudge the main question, which is still under examination by the law officers of the Government. The regulations set forth in the circular are as follows:

Instructions to Collectors.

1. The sworn entry shall embrace, in addition to what is now required, a statement of the estimated quantities and values of silver and lead contained in the importation, according to the best knowledge and belief of the importer or consignee.

2. The entry shall further contain a declaration that the importation embraces no mixture of ores or concentrates from different mines.

3. The entry shall also disclose the name and locality of the mine from which the ore has been taken.

4. Upon the arrival at the frontier of cars or other vehicles laden with ores containing an appreciable quantity of lead, they shall be locked or otherwise secured until entry be made and a permit granted to unload.

5. Upon the unloading, and at the time of the unloading, the officer of the customs assigned to that duty shall supervise the work and shall obtain proper and adequate samples from those taken for commercial purposes by the importer or consignee—that is to say, they shall be taken in the manner approved and practiced by miners in the handling and reduction of ores, by thoroughly mixing and quartering every tenth shovel or more, repeating the operation until the usual commercial sample be obtained.

To avoid the detention and expense incident to the unloading and sampling at the frontier in cases where the cars or other vehicles are destined to an interior port or place without so unloading, they shall be adequately inspected, and if, in the judgment of the collector, the ore is deemed to contain lead in quantity sufficient to make it dutiable, or if the legal classification be held doubtful, appraisement may be waived and entry made on an estimate of duties and the goods permitted to proceed to their destination under a warehouse and transportation bond. The entry is to be ultimately liquidated under an appraisement based upon the samples selected in the manner above prescribed in paragraph 5.

It is suggested that, in the execution of these instructions, care should be taken equally not to unnecessarily detain the ores wherein silver so clearly predominates as to fix their character commercially as silver ores, nor to admit without assessment of duty those ores wherein the value of their components of lead appears to exceed that of the silver contained in such ores.

It is further advised that in determining the relative values of silver and lead contained in the same ore, the value of the silver component, in the absence of more accurate data in the invoice or otherwise, be rated at 75 per cent of the latest known value of silver bullion in the New York market; and that the value of lead component be rated at the latest known price of bar lead in the same market, less one cent per pound.

From information before the department it is believed that neither difficulty nor hardship will result from the practical enforcement of these instructions, but if any obstacle shall arise in their execution, the Collector is to report the exact nature and extent of the obstruction, with his suggestion for its removal.

The Force of Natural Gas.

Although the wells about Findlay, O., are under control, the tubing is anchored, and the awful force is held under by gates and levers of steel, still it is impossible to escape a feeling of awe in this region at the subterranean energies which seem adequate to blow the whole country heavenward. Some of the wells were opened for us. Opening a well is unscrewing the service pipe and letting the full force of the gas issue from the pipe at the mouth of the well. When one of these wells is thus opened, the whole town is aware of it by the roaring and quaking of the air. The first one exhibited was in a field a mile and a half from the city. At the first freedom from the screws and clamps the gas rushed out in such density that it was visible. Although we stood several rods from it, the roar was so great that one could not make himself heard shouting in the ear of his neighbor. The geologist stuffed cotton in his ears and tied a shawl about his head, and, assisted by the chemist, stood close to the pipe to measure the flow. The chemist, who had not taken the precaution to protect himself, was quite deaf for some time after the experiment. A four-inch pipe about 60 feet in length was then screwed on, and the gas ignited as it issued from the end on the ground. The roaring was as before. For several feet from the end of the tube there was no flame, but beyond was a sea of fire sweeping the ground and rioting high in the air—billows of red and yellow and blue flame, fierce and hot enough to consume everything within reach. It was an awful display of power.

We had a like, though only a momentary, display at the famous Karg well, an 8,000,000-feet well. This could only be turned on for a few seconds at a time, for it is in connection with the general system. If the gas is turned off the fires in houses and factories would go out, and if it were turned on again without notice the rooms would be full of gas and an explosion would follow an attempt to relight it. This danger is now being removed by the invention of an automatic valve in the pipe supplying each fire, which will close and lock when the flow of gas ceases and admit no more gas until it is opened. The ordinary pressure for house purposes is about two pounds to the square inch. The Karg well is on the bank of the creek, and the discharge pipe through which the gas (though not in its full force) was turned for our astonishment, extends over the water. The roar was like that of Niagara; all the town shakes when the Karg is loose. When lighted, billows of flame rolled over the water, brilliant in color and fantastic in form, with a fury and rage of conflagration enough to strike the spectator with terror. I have never seen any other display of natural force so impressive as this. When this flame issues from an upright pipe the great mass of fire rises eight feet into the air, leaping and twisting in fiendish fury. For six weeks after this well was first opened its constant roaring shook the nerves of the town, and by night its flaming torch lit up the heavens and banished darkness. With the aid of this new agent anything seems possible.—*Charles Dudley Warner.*

Car Samples and Mill Returns.

At a meeting of the stockholders of the Savage Mining Co. held last week, at which 80,000 shares of stock were represented, a committee composed of W. N. Griswold, Theodore Fox and others filed a protest, directed to the "President, Secretary and Directors of the Savage Mining Company," in which it was set forth that under the present system of milling, less than 35 per cent of the assay value of the ores was returned to the stockholders. They also protested against the manner in which the superintendent's weekly and monthly statements are made out, and demand that the assay value of the ores at the mine and at the mill shall be given under oath, and filed where the stockholders can see it; and that hereafter, all contracts to mill ores shall be made in writing, and that the mill-owner shall be required to return at least 70 per cent of the assay value at the mine.

A comparative statement was presented, showing that the average assay of car samples during five months of last year was $37.20, representing a total of $186, and that during four of the same months the battery assays only gave an average of $20.11, representing a total of $80.46. Sixty-five per cent of $20.11 is $13.07, which was the amount returned to the stockholders of the Rock Point mill, or less than 35 per cent of the car samples ($37.20).

The protest recommends that the Board of Directors take immediate measures to recover the remainder of the bullion or its cash value. If this should be refused, the protesting committee will call for an accounting.

The Oldest and Largest in the World.

We notice that the enterprise of our friends, the New York Belting & Packing Company, New York, is attracting the attention of the daily press of that city. A writer of the New York *World*, in a recently published article of some length describing the rapidly growing manufacturing interests of Passaic, N. J., speaks of the company's factory No. 2, located there, as follows: "The greatest representative of the rubber industry is the New York Belting & Packing Company, the oldest and largest establishment of the kind in the world. The factory at Passaic is an annex of the original works at Newtown, Conn., but since its establishment here in 1882 it has grown in size and importance, so that it now almost rivals its parent. The Newtown establishment is one of the finest mill properties in America and employs between 300 and 400 men. The New York Belting & Packing Company confines itself exclusively to the manufacture of mechanical rubber, such as belting, packing, hose of all kinds, rubber mats, car, wagon and cylinder springs and bumpers—in short, nearly everything of a mechanical nature for which rubber is used, and owns and controls several patents covering different processes incidental and indispensable to the making of the above goods, and particularly for machine belting, vulcanized between layers of a patent metallic alloy, by which the stretch is entirely taken out, the surface made perfectly smooth and evenly vulcanized. Mr. J. H. Cheever is the treasurer of the concern and J. D. Cheever, deputy treasurer."

PERSONAL.—Mr. W. L. Pierce, secretary of the Lidgerwood Manufacturing Co., and general manager of their principal office, 96 Liberty street, New York City, sailed for Europe, Saturday, July 6th, to be absent two months. Mr. Pierce will combine business with pleasure during his trip abroad, and will visit the Paris Exposition before his return.

Two Scenes in Fruit-Drying.

The two pictures upon this page are timely and suggestive of the dried fruit interest of California. It is true that the apricot harvest in the earlier regions of the State is over and the fruit put in durable form either by canning or drying, but in the later regions the work is not yet done.

The scenes are not presented as prevailing methods either of gathering or of handling after drying, but they represent certain phases of practice.

The engravings are from photographs taken in Southern California. The first represents the gathering of apricots by shaking over canvas spread upon the ground, as practiced in the famous apricot orchard of Dr. Jarvis of Riverside. Though the shaking of fruit upon canvas is the rule in prune gathering and a very excellent apparatus for this work has been invented by Mr. Fleming of San Jose, apricot-growers generally hand pick their fruit, because they are thus enabled to secure it when too ripe to admit of shaking down. Still the experience of Dr. Jarvis, who is a prominent apricot-drier, seems to approve the shaking process. Shaking is usually an easy way to secure fruit of pretty uniform ripeness, but it is not likely that the finest grades of apricots or peaches will be made in that way, although it succeeds admirably with prunes. The bruising results in discoloration of fruit which is to be light colored when dry, while with a black fruit, like prunes, the effect is not so discernible.

The other picture presents the opposite end of the drying practice, for it shows the dried fruit heaped up in the orchard for sacking. This, too, represents only one phase of practice, because it is not customary to finish the fruit harvest in this way after the producer has proceeded further with his enterprise and has secured a packing-house, to which the fruit is carried when sufficiently dried and is there sweated in mass under cover before boxing or sacking; still the picture is a true one from a photograph of an actual scene, and can be taken as evidence with what simple contrivances it is possible to gather a merchantable article of dried fruit in the favoring climate of California. The scene is also suggestive of how cheaply the product can be secured and still yield the grower a living profit. Of course the more careful gathering and the more elaborate methods of processing and packing yield a fancy article which is high priced and costs the grower more to produce. But it is unquestionably true that the world demands an immense quantity of good fruit which can be sold cheaply; so it is a question as to whether the fancy or the ordinary article will in the end bring the greater money to the State and the greater profit to the producer. Now that the orchards are assuming such vast extent, and the labor supply is not keeping pace with it, it seems of the highest importance to discover how the largest amount of good, wholesome fruit can be placed upon the market at the lowest cost of production. This remark applies to the gathering, the pitting and paring of fruits which require them, and the sacking for market. No doubt cheapness of production will be the measure of the greatness to which our dried-fruit manufacture can be profitably extended. The orchard scene during the sacking of the product suggests another important matter. The artist has caught the operatives in variety, and thus shows that in many cases the saving of the fruit enlists the labor of the whole family from grandmother to grandchild. No doubt a great part of our product will always be the result of family labor as it now is. Thus the advantage of small farms and large families is seen as affording a solution of the vexed labor question. The same condition will bring population to our State, thousands of prosperous homes to our vast valleys and productive hillsides, and will enable many thousands to enjoy participation in the blessings of life in California who could never thrive here under the old system of large farms and small use of labor.

GATHERING APRICOTS FOR DRYING IN DR. JARVIS' ORCHARD, RIVERSIDE.

ALASKA MINES.—Advices from Alaska dated July 10th are to the effect that the company working the Bears' Nest mine, adjoining the Treadwell, have struck the ledge. The ore is said to average higher than that in the Treadwell. A mountain of some unknown mineral has been struck. It was thought to be silver, and did carry $2 per ton, but it contains a large quantity of mineral not known. A sample has been forwarded to San Francisco for assay.

JOSEPH MCLANE, who had been working in the Stonewall mine, Cuyamaca mountain, San Diego county, drew his wages and started prospecting. The principal part of his supplies consisted of bad whisky. He camped near the Stonewall about ten days, and there was no sign of his having cooked a single meal during that time, but there were about two dozen empty whisky bottles and demijohns scattered around his dead body. The jury's verdict was that he died of exhaustion, caused by drinking.

Forestry and Irrigation.

B. E. Fernow, Chief of Forestry Division, U. S. Department of Agriculture, was a welcome visitor at the PRESS office one day last week. He had arrived at Portland, Oregon, on the 2d instant, his mission to this coast being twofold—first, to gain a general idea of our forests and the possibility of their natural perpetuation; second, to prepare a report to the Senate Committee on the relation of the Pacific Coast forests to the great irrigation problems which the National Government is investigating.

After visiting Seattle and Tacoma, Mr. Fernow went into the big timber of Mt. Tacoma. The magnificence of these forests he declares surpasses anything he has ever seen. "For twenty miles," he says, "I traveled among red fir and hemlock trees that averaged in hight from 150 to 200 feet, and from 8 to 9 feet in diameter. Many of them would cut over 100,000 feet of lumber. A gentleman with whom I was talking told me that the trees on an entire section, which he had felled, averaged 60,000 feet."

From Mt. Tacoma he went directly to Mt. Shasta, where he spent a few hours in the examination of the characteristic Sierra timber. From this interesting district a jump was made to the famous redwood forests at Cazadero. In regard to these, Mr. Fernow remarks: "The forest is wonderful, wonderful, but from hasty observation it is my opinion that our grandchildren will have no such magnificent timber to cut. Fires have to a great extent worked the ruin of California forests. The constant burning over has not only destroyed the young seedlings, which should be springing up, but the vegetable mold, in which the seed finds it congenial to sprout, has been consumed. After nearly a day's hunt in the redwoods, but two or three little seedlings were discovered growing in the soil, while about twice that number were found flourishing in an old stump where a little vegetable mold had accumulated."

While Mr. Fernow considers the reproductiveness of the redwood by sprouting quite remarkable, he seems to think that these sprouts will never attain great size nor be of much value.

The only two trees which, in his opinion, are satisfactorily reproducing themselves, are the Douglass spruce, and on the drier slopes, the Bull pine.

In his report to the Senate Committee, Mr. Fernow earnestly advocates the preservation of the forest covers of the slopes of the Sierras, and he thinks California should be aroused before her splendid forests are totally destroyed by fire and the woodman's ax.

In regard to the great reservoir and irrigation problem, he thinks the Government is in earnest, and will make all necessary investigation and surveys, after which private enterprise will complete the work of building the reservoirs and distributing the water.

During his call upon us, Mr. Fernow expressed much gratification at the admission of the head of the Agricultural Department to a seat in the Cabinet, and hopes that the Division of Forestry may soon be placed on the substantial footing which its importance deserves. He left this city on the 10th for the Yosemite, after investigating which he purposed paying flying visits to Arizona, the plateaus of Southern Colorado, and the Kansas timber belt, and then returning speedily to Washington, where pressing official duties require his presence.

SACKING DRIED APRICOTS IN A PASADENA ORCHARD.

ON the Bear Nest mine, Alaska, day and night shifts are employed on the work of excavating for a foundation for the mill. Other work is being pushed ahead with all vigor possible. The true ledge was struck in the tunnel a few weeks since.

HENRY G. HANKS has sent a communication to the Trustees of the Mechanics' Institute Fair offering to place on exhibition ten eight-foot cases of minerals, duly labeled, without expense to the Institute beyond the hiring of the cases.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

THE COAL MINE.—Livermore *Herald*, July 20: Jenkins Richards, superintendent of the Livermore Coal Mining Co., reports that he has begun drifting both ways on the Pen Daren vein, at a depth of 300 feet, and will soon be ready to take out coal. The vein is between 4 and 4½ feet in width. He is not informed as to whether the company will begin shipping coal at once, or await the building of a railroad.

Amador.

UNION.—*Dispatch*, July 20: The prospects at this mine are getting more favorable each day. Last week a stream of water was encountered which is a pretty sure sign that they are approaching the independent ledge of which we spoke some time ago.

COSMOPOLITAN.—Most all the lumber is on the ground for the new mill, the work goes on of opening up the mine; the shaft is down 615 feet and is getting very hard, making sinking slow. The Ginocchio Co. are running their Huntington mill on some very good ore.

HENRY CLAY.—The tunnel is in 260 feet, the ground is a little harder at present; the contract will be finished by August 1st.

GOVER.—The mill has started again after being idle two weeks.

SUTTER CREEK.—Amador *Ledger*, July 20: The additional building at the Wildman is now rapidly assuming the shape of a mill. The mortars are on the ground ready to be placed in position, and probably in three weeks more the additional stamps will be ready to drop. The company has furnished the mine with a new 1000-foot wire rope. The new compressor that was received from San Francisco three weeks ago will be operating the Burleigh drills in the mine. This will be an important change, as the rock is exceedingly hard.

MANDICH.—*Ledger*, July 20: This claim, between five and six miles east of Sutter creek, was bonded a few months ago by S. D. R. Stewart, who spent considerable money in the erection of a six-stamp mill and other surface improvements. As soon as the ore on the dump was crushed the ore body seemed to pinch out, and work was suspended. In June the term of the bond expired, and the property fell back into the hands of the original owners, Mandich Bros. and Leggett. S. Mandich and D. Leggett have been working on the property for six weeks. They have sunk two winzes, 45 feet apart, the farthest being 80 feet from the mouth of the tunnel. This winze is 22 feet deep, with from four to five feet of ore at the bottom, the ledge increasing in size as depth is attained. Samples of the rock taken from this winze were shown us this week. It is a dark-looking quartz, liberally sprinkled over with specks of free gold. Mr. Mandich informs us that all the ore prospects big in free gold. The samples shown us we should judge would yield at the rate of from $12 to $20 per ton, to say nothing of sulphurets. There is about 60 tons of ore on the dump, but it cannot be crushed for lack of water.

KEYSTONE.—A body of ore, about 20 feet wide, has been struck in this mine, north of the shaft, between the 900 and 1005-foot levels. The rock is of good quality, showing plenty of sulphurets and some free gold. Its extent is not known at present. It may prove to be only a bunch, but present indications are favorable for a good ledge.

MISCELLANEOUS.—At the Zeile the repairing of the shaft is about finished, and the starting of the mill to its full capacity is only a question of a few days. The force of miners will be materially increased. The prospecting operations at the Morley or Wetzlar claim continue without any change to note. Quartz is met with frequently, but not in the nature of a defined ledge. At the Kennedy, sinking is being prosecuted in both shafts. Twenty stamps of the mill are kept going, which is as much as can be hoisted while sinking is going on. A cleanup was made at the cement gravel claim at Volcano, operated by a French company, last Sunday, and we are informed the result was highly satisfactory. The owners are greatly elated at the outlook. It looks as though this cement mining would bring about an important revival of mining industry in Volcano and vicinity. At the Amador gold mine men have been put to work again on the reservoir. It is freely reported in Sutter creek that the Mahoney mine has been sold to the Eastern company that owns the Wildman mine adjoining. The consideration is stated to be $60,000. We give the statement merely as a current report. The Bunker Hill mill is running 20 stamps.

Butte.

GOLDEN GATE MINE.—Gridley *Herald*, July 13: About 100 men are at work on the Golden Gate mine, on the Feather river three miles above Oroville. A flume 50 feet wide, six feet deep and 3300 long is nearly completed. It is expected considerable gold will be taken out of the claim this fall. The river bed to be worked is known to be exceedingly rich. This is another of Major McLaughlin's mining schemes, and he has induced foreign capitalists to invest in it. He is the manager, while N. A. Harris is superintendent.

Fresno.

MINARET DISTRICT.—Cor. Fresno *Republican*, July 20: Hearing of the great richness of the Minaret mining district, 100 miles northeast of Fresno, I concluded to visit the mines. We found in camp Mr. Chapman of San Francisco, a well-known mountaineer and railroad man, and Geo. Senn, a mining expert of that place. We at once proceeded to examine some of the mines. They are undeveloped and none of them have been prospected to a greater depth than four feet. All of them showed heavy rock containing metal. On the following day five of us rode for four miles amid meadows, mountains and lakes, and came to another group of mines. The ledges are of immense size and in cap rock. One was prospected to the depth of two feet and showed rich indications. Here I located a claim, which, in the opinion of Mr. Senn, is the best part of the district that he had examined. There is considerable pine, tamarack, fir and juniper in the canyons, but timber is very scant on the high grades. Water privileges are abundant, there being three streams large enough to supply any power required. After 30 years of prospecting in various parts of this State I can give it as my unbiased opinion that I have never found a district equal to this for the extent and quality of its mineral resources. The only drawback is its isolated situation.

Inyo.

CERRO GORDO.—Inyo *Independent*, July 20: Rumor is current that the same parties who have got control of the Cerro Gordo mines have also secured the water-power on the Eastside Canal. At the Eclipse there is a drop in the canal of 25 feet. This will give a large amount of power, and it is said that a 60-ton furnace will soon be built there for the reduction of lead ores. There is still a possibility that a marble-mill will be built there; power enough can be supplied for these or more works.

Mono.

THE BODIE CON.—Bodie *Free Press*, July 22: During the past week West Crosscut No. 2 from north drift, 1200 level, was advanced 15 feet. East crosscut, same level, was driven 15 feet. There were employed 10 miners, 1 foreman. During the past week west crosscut from south drift, 1200 level, was advanced 21 feet. There were employed 6 miners, 1 foreman. Jointly with Bodie upraise from south drift, 1200 level, was extended 9 feet, connecting with winze from 1000 level. West crosscut from upraise was driven 21 feet.

Nevada.

HARTERY MINE.—Grass Valley *Union*, July 20: Orlando Stoddard, who has the contract, has commenced the erection of hoisting and pumping works on the Hartery mine, and will have the building completed and the machinery ready for operation in about four weeks. The machinery will be driven by steam-power. The incline shaft of the Hartery is down 700 feet, but the mine is tapped by a drain tunnel 1700 feet in length at the depth of 300 feet. Below this two levels are opened, and when the mine was worked last, some four years ago, on the tribute system, some very high-grade ore was taken out. Work was suspended then because of negotiations for the sale of the mine, which subsequently fell through. The mine has lain idle since that time, but the pay shoot that is known to exist will be opened up by the new company that will soon have things in shape for regular and systematic working. The Hartery is on the famous mineral belt to the south of Grass Valley and on the west side of Wolf creek, and is situated between the North Star and the once famous Allison ranch, and has always been regarded with favor by the miners of the district.

QUARTZ AT MOORE'S FLAT.—Grass Valley *Union*, July 18: E. G. Creller and Wm. Reynolds went to Moore's Flat on Tuesday to look at the Abrams quartz claim, located within a short distance of that place. The claim has been opened by tunnels driven on the ledge, from the face of the hill. One of the tunnels is in a distance of 700 feet, and the ledge shows a variable width, being generally strong. The lowest crushing made from the quartz has gone over $4 to the load, and some from the same location has yielded over $100. The claim is well situated for working, as all the quartz and waste can be run out of the tunnels by cars, doing away with the necessity of pumping or hoisting. There is also plenty of free water for milling purposes to be obtained below the site of the mine, to which the ore can be sent down by tramway or ore-chute. There is no mill built on the property, Mr. Abrams having devoted all of his labor to prospecting the claim by running tunnels on the ledge. The prospect is considered an excellent one, and justifies the erection of a mill by which operations may be carried on regularly and systematically.

MINING TRANSFERS.—*Tidings*, July 19: A controlling interest of the Gold Hill mine will surely pass into the possession of the syndicate represented by Whittaker Wright of Philadelphia. In fact, the mine is now practically in the possession of the syndicate, the stock to be paid for in 90 days at the rate of 40 cents a share. One of the other properties negotiated for by the syndicate has also practically passed into its hands. Two or three other adjoining claims may also be transferred, in which event the syndicate will own one of the richest and largest mining properties in the world. In fact, the Oro Flat, Gold Hill and the other claim alluded to comprise a piece of mining property second to none, and too valuable in the hands of capital to remain idle a day longer than can be avoided. The syndicate has in late years sunk from $1,000,000 to $3,000,000 in British Columbia mines, and is now withdrawing from that country in favor of the Grass Valley district, where it confidently expects to more than recoup itself.

THE MANZANITA DRIFT MINE.—*Transcript*, July 20: A pan of gravel taken at random Thursday from the old tunnel of the Manzanita drift mine yielded about $9 worth of gold. Of course the whole lead does not pay like that, but rich spots are frequently encountered. The new tunnel is now in 150 feet, having been advanced 64 feet in the last week. It will tap the channel at a distance in of something like 1500 feet, and will probably reach gravel in from three to four months hence. Two shifts of three picks to the shift are employed.

THE SEVEN-THIRTY AND BOWERY.—*Tidings*, July 12: D. B. Lynch exhibited to-day some specimens of quartz taken from the old dump on the Seven-Thirty and Bowery (consolidated) claim. This property is situated in Deadman's Flat, and is noted for its "pockets," two miners once taking out $5000 in a day. The deepest shaft on the claim is down but 140 feet, yet $100,000 has been extracted from time to time. The prospects are that a hoisting and pumping plant will be put up before long and development work actively prosecuted.

IDAHO MINE.—Grass Valley *Union*, July 22: Regular shifts are now working on the No. 14 level of the Idaho mine, but no hoisting of quartz to the surface is yet being done. The steam pumps are at work pumping the water from the shaft below the No. 14, and fair progress is being made. There is a large body of water below filling the 15th and 16th levels, and it will take some weeks to drain them. The mine is found in good condition as the water is lowered.

THE DERBEC MINE.—*Transcript*, July 18: At the Derbec drift mine there are 135 men on the pay-roll and about 125 working steadily. This is as big a force as has ever been employed there. Under Supt. Galavotti's very intelligent and energetic management, good results are being obtained.

Placer.

FOREST HILL DIVIDE.—*Placer Herald*, July 20: At Yankee Jims there is but little being done in the mines. Harry Adams has been putting the Red Sea in a good condition for work. He has laid iron rails, and from this fact and other signs it is reasonable to believe that the company means business. Charles Trafton is at work at his tunnel which is now about 800 feet in length. This tunnel, when completed, will be low enough, he thinks, to work the Dardanelles, Mountain Tunnel and several other mines. Mr. Trafton has been pushing the tunnel alone for several years and we trust his labor will be rewarded. T. Gilbert is running a drift for a top lead in the Ben Franklin. The Dardanelles has been shut down temporarily. Superintendent Dodge is running a drift above the tunnel in the Biker Divide ground. At the Mayflower there is every indication that the gravel is as rich as ever. The gravel is not wholly blue, but assumes various shades, being chocolate, gray and blue colored in different parts of the deposit. The tunnel is 5585 feet in length; 750 feet of it is an incline, followed by a level 50 feet in length. From this level to the gravel is an upraise of 30 feet. From the tunnel gangways have been run up and down the channel, which extends in a northerly and southerly direction. The north gangway is 666 feet, and the south gangway 784 feet in length. From these gangways upraises or chutes have been run to the gravel above. The pay gravel has a depth of six feet. Between chutes one and two in the north gangway a body of yellowish-colored gravel and cement has been met which contains considerable water. This new deposit is entirely different from that of the Mayflower, not only in color but in kind, being a quartz formation. Some think this is the Orono channel, but it has not been sufficiently prospected and explored as yet to ascertain its extent or from what quarter it comes. It is less than 200 feet in width, as the Mayflower gravel comes in again near chute number two. The main channel, like all other channels, varies in width. The gravel is hard and compact, requiring powder to dislodge it. The cars are pulled in and out by mules, the ordinary number of cars to a train being 16. The mill is run night and day. The 20 stamps are constantly pounding away, and the company is preparing to put in 10 or 15 more. The compressor at the big shaft has been removed to the mouth of the tunnel and assists in running the drills and in ventilating the mine. Just at present 135 men constitute the working force. As many as 200 have been employed at one time. The mine and mill present a busy scene, and there is every indication that the channel will continue to yield its golden harvest with all the profusion that has characterized it since the mine was opened. Twelve men are employed at the Breece and Wheeler mine. Mr. Breece is preparing to open up the breasts in such a manner as shall give room for a large force of men to work. The pay gravel is a foot in depth. The bedrock is shelly and is rich in gold. The gravel is dark and cemented, and from some specimens shown us by Mr. Breece must be extremely rich. The gravel was literally packed with gold nuggets from the size of a cucumber seed to a pigeon's egg. In one shallow crevice 30 feet in length $14,000 was taken out a short time ago. The tunnel is in over 8000 feet. No Chinamen are employed in this mine. T. N. Hosmer has discovered a new channel under the Willett channel, that was worked in 1854. He thinks the deposit is 1000 feet long. The gravel at present pays good wages, but he expects to find bigger pay shortly.

Shasta.

SQUAW CREEK.—Redding *Free Press*, July 13: Work in the numerous mines on Squaw creek is booming. From Ben Conroy we learn that the Balaklala is still producing its quota of gossan ore, rich with silver and gold. The rock is being tossed on the dump for future operations. We believe that it is the intention of the company owning the Balaklala to put in a mill and crush the ore on the spot, instead of sending it below for reduction. It is reported along the creek that operations on the Black Bear mine will soon be commenced again. This property is owned by Riley & Bliss, the latter being a partner of Vice-President Morton. The mine is generally regarded as a splendid piece of property. The Central mine, in the Old Diggings district, which has been idle for nearly a year, is also reported to be on the point of resuming work. This mine is owned by Riley and Whitehouse. It is said that Frank Satterlee of Iron Mountain will hereafter superintend the Central mine. The superintendent of the Walker Brothers' mine is reported to have said that his force is at present working on a 20-foot vein of $20 rock. This, if true, would make it appear that the Walker Bros. never made a better investment. The Sierra Buttes M. Co. has a force of over 65 men at work. This company is preparing to work the Uncle Sam mine on a much larger scale. Ten stamps will shortly be added to the milling capacity of the plant. A force of men is constantly employed hauling logs to the sawmill, and a tramway one mile in length, reaching from the mine to the mill, is now being constructed. The sawmill, besides turning out timber for the mine, is cutting lumber with which to erect dwellings for the employes and their families, sheds and other necessary buildings. The laborers receive $2 per day and found. The Squaw creek wagon-road lacks but three-quarters of a mile of being finished. Forty-five men are employed, and the work is being pushed as rapidly as possible.

FROM ANOTHER SOURCE.—The following additional items were sent in by a correspondent after the above had been put in type: J. McTimmons has bonded his mines to some parties who have also bonded the well-known Clipper mine, though I have heard that the latter is a short bond. Judging from the mining men that have passed "Saints' Rest" to-day, a large force of men will soon be put to work. The Snyder mine, owned by San Francisco parties, has another tunnel in something like 500 feet. The ore is low grade, but I venture to say there is more quartz in that tunnel than in any other on Squaw creek. J. N. Vannoy is hard at work at present running a tunnel to tap the Joseph E. Johnson ledge 150 feet below the surface.

FRENCH GULCH.—Shasta *Democrat*, July 17: All the mines surrounding this camp are in a prosperous condition. There are more different properties here paying dividends than any camp in California can boast of. The oldest mines that have not done much for years are becoming great. The new ones are above their owners' expectations, and the working forces have been increased in a great many. The old Washington has uncovered a large body of high-grade ore. The Highland owners are building a mill on Clear creek. Frank Wheeler is running his mill on ore he hauls on sleds for near a mile down hill and 1500 feet perpendicular above the mill. The J. I. C. company has a chute of ore opened. It is 75 feet long and averages $80 a ton, the west face being immensely rich. The Gladstone company is crushing ore from the Helena, which they handle six times before it gets to the mill. The lower tunnel on the Gladstone will reach the ledge in 25 days, giving backs of 450 feet, then no more deadwork will have to be done on the three mines until this is worked out. Some prospectors are opening up a ledge between Clear creek and the Highland, which will make a chain of mines in a straight line from Deadwood, Trinity county, to the head of Grizzly gulch, Shasta county, a distance of 16 miles, and gold and silver ledges are found between this point and Squaw creek.

Sierra.

MILL.—*Mountain Messenger*, July 20: After some delay, Mr. Leak has got a Pelton wheel, to run his Huntington mill on the Montpelier quartz mine at this place. The mill has been running eight or ten days, altogether, and is capable of crushing, so Mr. Leak says, about 12 tons in 24 hours.

PIKE CITY.—We learn by letter, from Pike City, a four-feet and eleven-inch ledge, of fine rock, was struck in the Sun Flower, and, as far as prospected, the ore will yield $20 a ton. By November 15th a mill will be running. The tunnel is in 5791 feet from mouth to ledge, 386 feet through hard rock. This is liable to prove valuable mining property.

DRIFT CLAIM.—J. H. Pierson, one of the stockholders in the St. Charles Hill drift claim, about four miles by trail, northwest of Goodyear, called on us, Wednesday, and reported six men employed, preparing for the thorough development of that valuable mining property. This force will be largely increased when the boarding-house is completed; 800 feet of tunnel has been run, 300 feet through gravel that prospects very good.

Siskiyou.

QUARTZ.—Yreka *Union*, July 17: Mr. Geo. Simmons, an energetic prospector of Humbug creek, found a rich quartz ledge last week, specimens from which show a great amount of gold visible to the naked eye. The McConnell claim on Klamath river, just below mouth of Humbug, is now paying well, and good returns are expected from now until the winter rains commence. The Centennial claim, just below Honolulu, on the Klamath, is also paying well, with better prospects ahead as the work progresses along the pay channel. The Mott Co. had their head and wing dams broken to some extent a short time ago, by the foundations giving way, but will soon have the repairs completed, to commence hoisting out pay gravel in a short time.

RIVER MINERS.—The river miners at mouth of Scott river, on Klamath river, and above and below, are rapidly progressing with the completion of wing-dams, with expectation of soon being ready to hoist pay gravel. The river is strong and deep at this point, requiring more work than farther up stream, although easier this year than usual on account of the stream being lower than ever before known since settlement by white people. Vance, Churchill & Autenrieth have been striking rich prospects of gold in Yreka creek, at their water works' pit, near the Miner-street crossing, and may succeed in being able to secure a good haul of gold as well as plenty of water. Charley Humphrey, who has a rich ledge of quartz on Humbug creek, sold out last week to Price & Co. of San Francisco for $15,000.

AT HUMBUG.—Yreka *Union*, July 20: Mining at Humbug continues to receive marked attention, and different parties have a good thing there and are doing well. An engine is on the way to that locality, to take the place of water for quartz-crushing. Mining has not run out in Siskiyou by a good deal.

San Benito.

QUICKSILVER.—Hollister *Free Lance*, July 19: W. F. Dalzell informs us that last week the firm of Griffith & Dalzell & Woodie Bros. shipped to San Francisco 26 flasks of quicksilver, worth nearly $1800. It was all taken from the Gypsy mine.

San Diego.

ASBESTOS FROM THE DESERT.—San Diego *Sun*, July 19: The first carload of long-fiber asbestos from the desert mines, 25 miles southeast of San Jacinto, is being shipped through that city for Hoff & Bates' Asbestos works at Pacific Beach. A carload of short fiber from the Elsinore mines is also ready for shipment. Mr. Hoff said to-day that they had found the long fiber was best for boiler covering and the short fiber for paint.

HOISTING WORKS.—Julian *Sentinel*, July 20: Gov. R. W. Waterman has come south for the purpose of recuperating his health, and also to watch the progress of the work of putting up a set of new hoisting works for the Stonewall mine. He awarded the contract for doing this work to C. L. Lind of San Francisco, and they will cost between $50,000 and $75,000. The Governor will also cause four or five miles of pipe to be put in to carry the water from the Cold spring to the mill and town.

WASHINGTON.—Messrs. Keener and Dilks are making the dirt fly in the Washington mine. The shaft is down 35 feet, and is now inside the old works. Mr. K. says it has been left for them to unearth the boss bonanza of the camp.

Tulare.

AT DUNLAP.—Tulare *Times*, July 18: The shaft on the 99 mine at Dunlap, owned by residents in this city, has been sunk to a depth of 104 feet, and a contract has been let to run a crosscut in the lead. A ton or more of the rock was sent to S. F. a week or two since for a working test, and the returns were satisfactory to the owners of the mine. The lead has widened considerably at the depth of 104 feet, and the character of the rock has also greatly improved. After the crosscut has been run, and everything proving as satisfactory as at present, the tunnel abandoned some time since will be continued in on the ore body and the mine fully developed.

Tuolumne.

DISCOVERY.—*Independent*, July 20: A nice discovery has been made by a certain party who has

been working for some time on a quartz lode, within two miles of Sonora. He has at last "struck it good." At a depth of five feet the vein is 2½ feet wide, and growing wider in sinking. The rock prospects $12 per ton in free gold. Our informant states that we can look out for another Sonora bonanza.

NEVADA.

Washoe District.

CON. CAL. & VA.—Virginia *Chronicle*, July 20: The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. On the 1300 level ore is still being extracted from the main south drift, spoken of in the last report, but is of low grade. On the 1650 level: The stopes on the 7th and 11th floors above this level continue to yield ore of fair quality. Stoping ore from the upraise which connects with this level. The north drift from the bottom of the winze, down 60 feet below the track floor of the south drift on this level, is extended 332 feet, continuing in porphyry and quartz of some value. On the 1950 level the incline winze in the vicinity of the old stopes in the south end of the mine is down 55 feet. This winze is being sunk on an ore streak of good quality, four feet in width. During the week 1099 tons and 400 pounds of ore were shipped to the Morgan mill; 1555 tons to the California mill. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $30.50. Bullion valued at about $12,000 on hand in the assay office. Shipped to the Carson mint during the week bullion valued at $42,935 90.

OCCIDENTAL. — From the top of the south winze connecting with the 350 level a south drift is out 102 feet. Formation in porphyry and quartz showing value. On the 350 level are extracting ore, and are preparing to stope out ore on the 400 level. The mill is nearing completion and will be crushing ore during the coming week.

UTAH.—On the 600 level the north lateral drift from the main west drift is advanced 218 feet; formation vein porphyry with streaks of quartz. West crosscut No. 3, 50 feet south of the upraise, is advanced 40 feet and cut the west wall.

BELCHER.—The winze below the 1100 level west crosscut is down 36 feet, the bottom in quartz, assaying from $5 to $10 per ton. The 1200 level south drift is still showing spots of ore, the face entirely in quartz.

CROWN POINT.—Have started a raise above the 350 level northwest drift to tap the ore cut on the 300 level. The 300 level south drift is showing fair-grade quartz.

SILVER HILL.—Usual progress made in advancing the 800 level northwest drift and the northeast drift. The raise above the southeast drift is still in porphyry.

UNION CON.—On the 1465 level, west crosscut No. 2 from the north lateral drift is advanced 91 feet and in porphyry intermixed with clay and fine lines of quartz.

CHOLLAR.—Quartz still showing in the 750 north lateral drift. The 850 level north drift is out 533 feet. The 650 level west crosscut is in low-grade quartz.

HALE & NORCROSS.—Explorations in progress on the 400, 500, 600, 950 and 1300 levels. There is a large area of ore stripped ready for extraction.

GOULD & CURRY.—On the 400 level west crosscut 1160 feet north of the south line, is extended 147 feet. Formation quartz and porphyry.

SIERRA NEVADA.—On the 520 level from the shaft station, an east drift is advanced 856 feet and continues in porphyry, with some water.

MEXICAN.—On the 1465 level the north drift from west crosscut No. 1 is extended 113 feet, continuing in porphyry and quartz showing value.

OPHIR.—On the 1465 level, in the east drift from the shaft station, 275 feet in. An upraise is up 79 feet, continuing in porphyry and clay.

CONFIDENCE.—The joint Challenge Imperial 500 north drift is out 95 feet from the Jacket shaft, and the face continues in low-grade quartz.

SAVAGE.—Exploratory work in progress from the 400 to the 900 level. The total bullion yield of the mine in June was $30,928.72.

NEW YORK CON.—The upraise above the 800 level west crosscut is showing a breadth of four feet of ore assaying $30 per ton.

POTOSI.—The 750 level south drift is out 561 feet, in porphyry and quartz. The 550 level west crosscut is in clay and porphyry.

BEST & BELCHER.—On the 1000 level the northwest drift is extended 91 feet. Formation porphyry with streaks of quartz.

EXCHEQUER.—The north drift on the 500 level is in porphyry. The 382 level west crosscut is still in barren quartz.

SEG. BELCHER.—The east drift from the raise above the 1100 level has cut several streaks of low-grade quartz.

ALTA.—The usual amount and grade of ore is being crushed. The 927 level stopes show an improvement.

YELLOW JACKET. — Shipping 100 tons of ore daily, showing an average assay value of above $25 per ton.

IMPERIAL.—The 300 level north drift is out 257 feet from the south line; the face is still in clay and porphyry.

JUSTICE.—Shipped 200 tons of ore to the mill, showing a value of above $28 from battery sample assays.

SCORPION.—The joint east drift from the 520 level of the Sierra Nevada shaft is out 856 feet.

BALTIMORE.—Nothing new in explorations in progress on the 338 and 22 levels.

BULLION.—Still exploring the 760 level quartz belt. No change in formation.

OVERMAN.—Repairing drifts and shipping small quantities of ore occasionally.

ALPHA.—The 500 level west crosscut is showing streaks of quartz.

ANDES.—Still sinking the winze below the 300 level in quartz.

Esmeralda District.

ESMERALDA CON.—Walker Lake *Bulletin*, July 17: A private cable just received from London says that the annual meeting of the Esmeralda Con. Mining Co. passed off quietly, and that $300,000 was subscribed then and there to carry on the work on a more gigantic scale. The property owned by this company is located at Aurora.

Eureka District.

EUREKA CON. REDUCTION WORKS.—*Sentinel*, July 20: A number of men have been employed at the Eureka Con. Reduction Works since the fire cleaning up the debris, and the carpenters are at work putting up a new building over the boilers. From the position in which the ore lies it will be necessary to build an incline track to hoist it to the new feeding floors. No. 2 furnace will be fitted up, and that alone will run for the present. The ore floors in the future will be situated on the hill above the furnace, where all the ore that is now coming in is being dumped, so that it can be fed into the furnace without an expensive and complicated hoisting arrangement, which it is intended to do away with. The buildings to be erected for the present, we learn, will be temporary and for the purpose of cleaning up in the least expensive manner the ore on hand.

WORTH THINKING OF.—If the contemplated reduction in freight on ore is carried into effect, it will not be long before the E. & P. railroad will be humming and buzzing with renewed life. There will be more mines opened in this district than ever were thought of before, and the timbers, mining material and general supplies that will be needed as the result, will put dollars into the pockets of these railroad people where cents do not drop at present. It is understood that the E. & P. Railroad Co. made a clean million during the first year of their operations. It would be no trick for them to make a million a year if an opportunity were afforded to our miners to work their low-grade ores with profit.

Pioche District.

BIG PUMP.—Pioche *Record*, July 18: The work of repairing the big pump at the Raymond shaft is practically finished and it is expected to start work during the coming week. The principal work going on about it now is bracing the column and attending to minor matters generally. Work on the boilers, new and old, is also about finished, insuring an abundant supply of steam, and we hope next week to be able to report the pump as successfully at work.

Red Mountain District.

PROSPECTING. — Virginia *Enterprise*, July 18: Some prospecting is again being done up at the old Red Mountain district, eight or nine miles to the northwest of this city. At one time there was quite a lively little town at this point. Many long tunnels were run and a great number of shafts sunk. There are scores of quartz veins in the district and some of them are immense ones. Good prospects may be obtained in not a few of these old mines. It is probable that below the water level some would prove rich. The whole district shows indications of having been subjected to great heat—vast volcanic fires. These may have volatilized the silver and driven it out of the upper parts of the veins. Though some gold is found in the district, the main veins have the appearance of being principally silver bearing. The old district deserves a careful examination in the light of our present knowledge of mining and prospecting.

Tuscarora District.

BELLE ISLE.—*Times-Review*, July 20: North drift, 150-foot level, extended 18 feet; face shows favorable with a little water.

COMMONWEALTH.—South drift from No. 3 winze, below 150-foot level, extended 10 feet, opening up a good body of ore. South drift from No. 1 west crosscut, 225-foot level, extended 11 feet; total, 16 feet in ore, some of which is high grade. South intermediate from No. 2 chute extended 16 feet in the vein. The 230 tons of ore sent to the mill have been taken from all parts of the mine, showing an average battery assay of $126 per ton. Bullion shipped, $15,809.76.

GRAND PRIZE.—Work has been resumed in the face of the west drift from north crosscut; vein is large, but low grade. Stopes are yielding and looking well. Work in other parts of mine was suspended and the 400-foot station cut in readiness for the pump, a portion of which is now in place. The concentrator is running steadily and doing good work.

NEVADA QUEEN.—Work has been suspended on 550-foot level, as the expense is so great, hoisting through North Belle Isle winze and hoisting from 450-foot level at the same time; 350 tons of ore have been sent to the concentrator, and 18¾ tons of ore worked at the mill; battery pulp assay $348.36 per ton.

NORTH COMMONWEALTH.—Sixty feet east of No. 1 upraise, No. 2 upraise has been carried up 14 feet in vein, 10 feet of which is low-grade chloride ore. A drift has been started south from No. 1 crosscut, 65 feet from the main south drift. The face shows some good ore.

NORTH BELLE ISLE.—The work below the 400-foot level will be suspended, pending the sinking of the shaft and the opening up of the 500 and 600-foot levels.

DEL MONTE.—East crosscut No. 1, 100-foot level, extended 12 feet; face all in ore. North drift, same level, extended 6 feet.

NAVAJO.—Upraise on east vein, south end, 350-foot level, extended 6 feet; total hight, 44 feet, still in high-grade ore.

ARIZONA.

MINERAL PARK.—Cor. Mohave *Miner*, July 20: The Keystone mill was shut down for a few days while putting in new flues, but is humming away again with plenty of ore on the dump. Foreman Uncapher tells me the mine is looking well and that portion of the company recently here departed well pleased with the outlook. Tom Stinson and about a dozen others are moving to some claims at the summit of Surrum's peak. Of course, Mineral Park is their headquarters.

LEASES.—Thomas Roberts has taken a lease on the Indian Boy. George Dougherty, who has a lease on the Alpha mine, brought in five tons of ore this week, which worked to his satisfaction. The strike recently made by John Hughes south of Stockton continues to grow richer as work on it progresses. C. H. Park has purchased the interest of Lamson, Hudgeons & Henson in the extension of the Queen Bee, and the mine will hereafter be known as the Jennie Foote. Mr. Park has let a contract for the sinking of the shaft to the depth of 100 feet. The sampling works have worked the following lots of ore since our last report: Tyler & Conkey, two lots, lease on C. O. D.; Harris & Co., lessees on C. O. D., two lots; Martinez & Co., from the Cedar district, two lots; C. O. D. mine, 30 tons; George Dougherty, two lots; Alpha, five tons. J. M. Dawley came in from the Monarch mine Saturday last and reports that Superintendent Beattie had found the ledge, and that the slip was not so bad as at first reported. Water was also struck. C. H. Park and E. S. Henson have obtained a lease and bond of C. E. Sherman on the Queen Bee mine at Mineral Park. They shipped to the mine this week a large supply of provisions and a lot of tools, and will put several miners at work running drifts and sinking shafts, and will open out the mine.

BRITISH COLUMBIA.

SIWASH CREEK.—*Truth*, July 18: Henry Van Buskirk of Vernon writes that prospects on Siwash creek are exceedingly favorable, and a great many people are flocking in and locating claims. He also states that the right of Indians to prohibit the working of claims by whites on their reserve is not yet settled.

DAKOTA.

BULLION DAY. — Deadwood *Pioneer*, July 17: Regular mid-month cleanups were made at the belt stamp-mills yesterday. Gold bullion, aggregating $160,000, goes forward to-day.

THE CHAMPION GROUP.—It is announced that the Champion mill will soon begin dropping 10 stamps on ore from the Highland Mary, one of the group of claims owned by the company at Spruce gulch. The ore runs from $3 to $13 per ton, but has to be sorted, as a good deal of it is refractory. The mining reporter is informed that the company proposes putting in concentrating works, and henceforth operating on an extensive scale. It is also hinted that more territory is to be acquired, and that several neighboring claims will soon be purchased.

IDAHO.

THE HUB MINE.—Wood River *Times*, July 17: The examination of the title of the Hub mine, near Era, was completed last Saturday afternoon, and resulted satisfactorily. The deed to the property was therefore taken up out of escrow, and the new owners took possession at once. The price paid is $90,000. The new company will lease the Bannack mill at Era for a few trial runs, and will in the meantime have new reduction works made in Denver. A few months hence a large force will doubtless be employed at the Hub.

NOTES.—Idaho Springs *News*, July 19: The Mary Foster people have been adding to their working force. Freeland working light force of men, mine not looking so well as usual. Lamartine working usual force and keeping up its lick; leasers all getting rich. Silver Age concentrator running satisfactorily and mine outputting plenty of ore. Two small retorts of gold from the Casino were sent to the company in Ohio this week. Clarissa mine has struck a large body of ore. Had to run for it farther than expected. Oneida working usual force of men and running mill constantly, making large shipments. The Kitty Clyde is employing the usual number of men and is turning out considerable good ore. Ute Creek turning out lots of high-grade ore. In fact Ute is so prosperous it has a faro layout. Mattie mine shipments not so large as usual, part of force engaged in retimbering the shaft. Plutus working quite a force of men, and mine looks splendid, producing plenty of good ore. Kooken & Brown have set up a whim at their shaft on the Casino, which they are sinking another lift of 60 feet. The battery in the custom mill that has been running on Cleveland dirt makes the best cleanup of any battery in the mill. Dove's Nest working quite a force and outputting lots of ore which will be sent to their mill here soon as road down Robinson Gulch is repaired.

LOWER CALIFORNIA.

CRYSTALLIZED GOLD.—San Diego *Sun*, July 20: Among the recent discoveries made on the Peninsula is that of some remarkably rich crystallized gold from a region about 50 miles below Almo. A small quantity was brought to the city to-day, of which five ounces were obtained by Gen. C. H. M. y Agramonte. These specimens, he says, are pseudomorphic orthoclase. That is, the cavity in the rock formerly occupied by a bunch of crystals, which were removed by decomposition, was afterward filled by the gold by deposition. One of the most beautiful features of the specimen shown is that it is composed of minute dodecahedrons, the form of crystal which gold often assumes, but rarely shows to as good an advantage as in this case.

NEW MEXICO.

PACIFIC.—*Southwest Sentinel*, July 18: The Pacific Gold Mining Co.'s new 20-stamp mill, situated just above town, is about finished. Everything is in readiness to start up tomorrow morning. The mill is in all respects a complete one, and just what the company needs for the reduction of the ores produced from their mines at Pinos Altos. The machinery consists of a large Blake ore-crusher, four batteries of five 850-pound stamps each, patent feeders, settling pan, five Gilpin County concentrators and such other things as are useful or necessary in a mill of this kind. The machinery is driven by a 60-horse power engine, which is supplied with steam by two large boilers. The mill will consume about 40,000 gallons of water per day. The mill will probably reduce from 40 to 50 tons of ore daily.

PINOS ALTOS.—Silver City *Enterprise*, July 19: The Wagner mill is running ore from the Little Mountain Key. The Carlotta, the southern extension of the Golden Giant, now the property of Toby & Co., is looking well. Recently work was resumed and the outlook for a bonanza mine is quite flattering. Recent assays from the Continental, belonging to Fox & Pritchard, show a value of six ounces of gold per ton, at a depth of 67 feet. The crevice is widening as depth is gained, and the outlook certainly indicates that the owners have a fortune in sight. Ore hauling began last Monday from the Pacific mine, to the mill of that name near Silver. Three six-mule teams are employed. Work has been resumed on the Golden Eagle. Carson & Fisher have made preparations to sink the shaft 60 feet, making a total depth of 100 feet. A tunnel is being driven on the Oro Fino location, to the point of contact of the porphyry and granite. All indications point to the existence of a vein at the contact. Osborne & Co., the owners, are confident of success. The Mountain View is still in bonanza, and the changes, if any, in the vein value of ore are for the better. In the new shaft, all indications point to the close proximity of the rich telluride vein for which the mine is justly noted. Present development now denotes that the ore chutes have a southerly inclination, and affords conclusive evidence that the richness of the vein will be found to the southward. To date, the mine has produced $20,000, an output dating from the discovery and location of the property.

MONTANA.

POLLOCK AND GLENGARRY.—Butte *Inter-Mountain*, July 20: At a recent meeting of owners of the Pollock and Glengarry, it was decided to separate the two mines, and they will be operated as separate concerns hereafter. The Glengarry will be in charge of Carney & Hand from now on. The property has five different veins, only two of which are of any size. The mine has produced over 72,000 ounces of silver, and has been worked 300 feet on one of the veins at a depth of 150 feet. Mr. J. R. Boyce, Jr., has received returns from the last shipment of gold from the Red Lion mine, which was sent to the United States Mint at Helena. The gold is shown to have been 993 in fineness, and therefore worth $19 to the ounce. This return is encouraging to the stockholders. Ed Hicks, superintendent of the Climax mines, regrets the position into which the properties have fallen, but says they are meritorious mines and will yet come out all right. Captain Couch this morning informed a reporter of the *Inter-Mountain* that water had nothing whatever to do with the temporary suspension of a portion of the work at the Mountain View. The water supply comes from the mine itself, and is the same now as it always has been. The work which has caused some of the men to be laid off is the putting in of a new pump and surface condenser.

OREGON.

BONANZA KING.—Bedrock *Democrat*, July 18: The Bonanza King, near Haines, is rapidly coming to the front as one of the bonanzas of this district. Saturday evening we interviewed one of the proprietors, who displayed specimens of iron sulphurets which assay $40 to the ton. This property will some day be recognized as one of the greatest producers of the camp. The Bonanza King is working ten men—three eight-hour shifts at present. News reaches us of numerous strikes in the vicinity of Susanville and Robinsonville. The Smith Bros. & Lane have opened a magnificent store at Susanville which will supply the entire country thereabout, Big Creek, Ruby Creek, Elk Creek, and the Green Horn districts. These points are all tributary to Baker City, but unless some attention is paid to the roads, the trade will drift to Pendleton. The mining property at Cracker Creek, owned by Mrs. Miller of this city, is being rapidly developed. According to all indications it will not be long before this property is yielding forth golden returns. The Chicken Creek placer mines are being worked with might and main. These diggings have been worked for several years, always paying liberal returns for the work expended thereon. A party of young men have opened placer claims on the divide between Burnt river and Connor creek. They report "blue gravel and bedrock pitching," which, according to pure English, means "everything is lovely and the goose hangs high." The Murphy Bros., Joe and Sam, have a valuable lode at Cable Cove. The rock assays well and the boys state that in the near future a mill will be erected that will stamp out the shining metal to the tune of $40 per ton. L. H. Johnstone of Robinsonville arrived in the city Saturday. He brought a rich specimen of ore from his claim in that district, which he bonded, while here, to Baker City parties for $5000.

UTAH.

PARK NOTES.—*Record*, July 20: An unusual amount of prospecting and development work is being done on the various claims up Thaynes canyon, and ere long the result will be more producing mines added to the list. The owners of the Disappointment are making ready to ship some ore the coming week and they expect to be well repaid for the effort. The Comstock, which adjoins the Disappointment, is undergoing vigorous developments and the ore body will soon be reached by the lower tunnel which is now in over 100 feet. The Jupiter leasers are making up a shipment of high-grade ore and it will soon be moved to market.

THE CONCENTRATOR STARTED UP.—The early part of the week the new custom concentrator (the Union) was started up on Woodside second-class ore. All the machinery worked smoothly, and there is no doubt that the capacity of the works for treating 100 tons of ore daily will be fully reached. W. V. Rice is manager of the new concern and Thomas M. Stringer is foreman and assayer. The Union will be of great benefit to the camp in stimulating the development of our mines, for with a charge of only $2 a ton for treating ores many thousand tons of crude ore hereabouts which in their present state would not pay to ship to the smelters can now be made marketable at a profit.

RUSSELL PROCESS TESTS.—The merits of the Russell leaching or lixiviation process, which has been satisfactorily in operation at the Marsac mill since the first of the year, are becoming better known and much interest is shown by mining operators by making inquiries and sending sample lots of ore from all parts of the country to be tested by this process. C. A. Alisky, a Washington Territory mine-owner, was the last one to have a sample lot of his ore tested. The result was very gratifying, for over 95 per cent of the value of the ore was extracted. Mr. Alisky contemplates putting in a Russell leacher at his mines to treat the ores, because he now knows that better results at less cost can be obtained by the Russell process than by any other method. A carload of ore from Australia arrived yesterday to be experimented on by the Russell process and undoubtedly satisfactory results will be obtained from the test.

MECHANICAL PROGRESS.

Nails From Tin Scrap.

We have already in these columns made mention of the fact that good merchantable nails have been made from tin scrap. Mr. Oberlin Smith of Bridgeton, N. J., who is associated with the inventor of the mechanism by which this nail is made—Mr. George H. Perkins of Philadelphia—read a paper at a recent meeting of the Institute of Mining Engineers, in which he describes at length the manner in which this new industry has been developed:

Many troubles and much study and expense has attended this development in order to reach a method of doing the work thoroughly and economically. Old tin cans, tin plate and sheet-iron scrap, as such material is thrown aside into the waste heap, is collected and pressed by powerful machinery into plates of proper form and size, from which plates the nails are subsequently formed, much after the usual way of nail-making from rolled-nail plate.

Much difficulty was at first met with from the nails splitting in even the most tightly folded corrugations, which could not be reached by the machinery first devised; but this difficulty has finally been overcome and a perfect nail has been produced. The machinery which was at first in separate parts has now been united into one complete automatic machine. It has been very much simplified and made enormously strong and heavy. It is adapted to cutting, crushing, gripping and heading the nails at one operation, and can be run as fast as an expert operator can feed the material. Its feed probably varies, with jagged, irregular scrap, from 30 to 90 nails per minute, although straight strips of sheet metal can easily be fed by hand into a machine running as high as 240 strokes per minute.

During the course of our experiments, says Mr. Smith, various forms of nails have been tried. Among others were straight cylindrical nails with conical points; straight, square nails with pyramidal and with wedge-shaped points; hexagonal nails, etc. The most practical form, however, seems to be the square taper nail, which has about the same shape as the ordinary cut nail, but is somewhat stronger and a good deal tougher. It is well adapted for all ordinary purposes, but is especially suitable for a roofing nail, since the tin coating prevents much rusting, and is good to solder to.

The economy of this system of nail-making is obvious. The scrap can be bought for about 17 cents per 100 pounds, and a boy can make perhaps 100 pounds of nails per day. The most economical system of manufacture will probably be to run one or more nail machines at each large "tin-shop," set as close as possible to the presses which produce the scrap, so as to avoid the expense of unnecessary handling, and the extra tangling-up incident thereto.

The Tin-Scrap Heap to Become a Thing of the Past.

The author of the paper, which we have condensed as above, in his opening remarks, writes somewhat facetiously as follows: It may surprise metallurgists who read this paper to learn that, by a recent discovery, nails of good quality can be made at one operation, directly from the ore, at the rate of, say, 60 per minute for each operator. It should be stated, however, that the raw material referred to does not answer strictly the ordinary assayer's definition of an ore. It is found, in strata of various thicknesses, in Harlem, N. Y., and other localities where the debris from restaurants and from sheet-metal factories of various kinds has been dumped. In other words, it is old and new tin-scrap—one of the few substances which this generation, mainly occupied in exhausting the accumulated resources of the past, seems to have laid up, by way of atonement, for the benefit of posterity. In speaking of this material as *ore*, we are simply looking forward, prophetically, to the time when our descendants may dig it up and write learned papers for the American Institute of Mining Engineers, upon the best methods of assaying and smelting it.

At least, such has seemed to be its destiny hitherto. It may fairly be said that the many attempts which have been made to utilize it by separating, through chemical or electrolytical processes, its two valuable constituents, metallic tin and first-class wrought iron, have failed, either technically or commercially. The reasons for such failure need not here be discussed. Either the separation has been incomplete, the iron still retaining enough tin to spoil it for the sinking fire or other use short of remelting (perhaps even for that) or the manipulations of the process have been too expensive to make its results profitable—or both. Meanwhile the great tin-scrap deposits have gone on growing faster than any other strata of our Post-Tertiary, Psychical era; given up by metallurgists, not yet attacked by geologists, and explored only by that mining engineer of the transitional period, *Gulielmus Caper*.

Before leaving these heaps of tin-scrap, however, to become mere mineral deposits for future ages, it may be well to consider a novel plan for their immediate utilization—novel, not only in its means but in its principle. For it undertakes to use this material just as it is, without trying to separate its constituents at all; and to use it, moreover, for a purpose in which the qualities of both these constituents, namely, the tensile strength and ductility of the iron, and the resistance of the tin to corrosion, are directly employed with advantage. I refer to its manufacture by mechanical pressure into nails.

FORGING BY PRESSURE OR BY BLOWS.—Very many forging presses are now in use for making large and heavy pieces, and the relative effect on the work is thus summed up by Prof. Kick, who has published in the *Technische Blatter* an interesting account of the experiments he has made on this subject. The difference between static pressure and that which results from a shock consists, he says, in the duration of their action. The weight of the hammer and the hight of the fall determine the total energy expended, but the power of the shock for a given expenditure of energy itself depends on the compression produced in the object struck. The feebler this compression is, the greater is the relative force of the blow to the pile. He has made some comparative experiments between the effects produced by an ordinary pile-driver striking upon an anvil solidly fixed, and by a balistic hammer, or one where the driver and anvil are both suspended like pendulums, so that the anvil is free to move. He has found that within rather large limits the work employed in the deformation of an object under the action of the shock only depends upon the product of the weight of the driver, and the hight of the fall for hights varying from 0.50 to 3 meters. The test pieces were small copper cylinders, fitted on to the same rod, and of the same initial dimension, 16 9 mm. long, 12 mm. in diameter, and weighing 18.4 grammes. One of the series has been submitted to the action of an ordinary driver, and the other to that of a balistic driver, taking care to obtain equal shocks under the two conditions. The weight of the anvil of the balistic driver was to that of the driver in proportion of two to one. The experiments have shown that a greater deformation is obtained by the ordinary than by the balistic drivers, all other things being equal. With the latter, a calculation of the proportion of force transmitted to it can easily be made, and it was found that 30 per cent of energy was expended. Other experiments made with the same apparatus have enabled the necessary energy of both to be determined on analogous eprouvettes.

THE WORLD'S PROGRESS IN IRON AND STEEL. An interesting paper has been published by Mr. James Neilson of the Massend & Summerla Iron Works of England on the production of iron and steel in Great Britain and the other competing countries during the last ten years, in which he draws a comparison between the increases made in 1886 in the competing countries compared with 1877. With a tariff of $7 per ton America had increased its make in ten years by over 3,000,000 tons, or 145.59 per cent; Germany, with a tariff of $2.50, showed an increase equal to 134 92 per cent; Belgium, with a tariff of $1, an increase of 48 04 per cent; Austria-Hungary, with a tariff of $2.18, an increase of 51.59 per cent; while Great Britain, the great free-trading country, produced 6,608,664 tons in 1877, and in 1886 the production was 6,870,665, being an increase of only 3.96 per cent. He also pointed out that the increase in the make of Bessemer steel had in ten years increased about 300 per cent in the United States, 200 per cent in Germany, 575 per cent in Russia, and a little over 100 per cent in Great Britain; and he argued that if the manufacture of steel alone had in this country increased in the same proportion as the other competing countries, an addition of two and a half millions of money would have been distributed in wages to the working classes.

AMERICAN PLATE GLASS.—It is only quite recently that plate-glass manufacture has been introduced into this country, and yet it is claimed, says the *American Manufacturer*, that the largest and best plates of glass in the world are now made in Pittsburg, and that difficulty often arises in their transportation owing to their size, the railroad tunnels not admitting them. Two plates, 14x16 feet, were recently ordered for use in a Philadelphia building, and it was found to be impossible to get rail transportation for them. Arrangements were therefore made to have them shipped by river to New Orleans, and thence by sea to Philadelphia. As an index of the progress made in this industry, it may be remarked that in January, 1888, a store in Detroit had a plate of beveled glass 13x7 feet and three-eighths inch in thickness, imported from England, which was claimed to be the largest in the United States. The plate above alluded to, as recently made in Pittsburg, is more than twice the size of the last mentioned at Detroit.

A STILL MOOTED QUESTION.—It still seems to be an unsettled question whether wood can be ignited by the heat of a steam pipe in contact with it. It is admitted, theoretically, that it is impossible for wood to take fire at a temperature of 212 degrees, or somewhat higher; but it is well known that there have been a large number of cases of fire reported as occurring from this cause, and the evidence is very conflicting.

ENORMOUS ENGINES.—Three new vessels in the Italian navy—Re Umberto, Sicilia and Sardegna—are each to be provided with engines to develop the enormous force of 22,800 indicated horse-power. Previous to 1881 the greatest power put into one ocean vessel was about 8000 indicated horse-power.

SCIENTIFIC PROGRESS.

The Grand Canyon of the Colorado.

This remarkable phenomenon of nature extends over 200 miles along the Colorado river, varying in width from 10 to 15 miles and in depth from 4000 to 8500 feet, rising in a series of terraces, often beautifully colored and marked and frequently castellated and peaked. The channel is winding and sometimes very narrow, whose somber recesses the sun's rays rarely visit. The river is broken by numerous falls of from 50 to 200 feet in descent, and countless rapids, whirlpools, swirling eddies and miniature maelstroms, wherein lie bowlders, are ofttimes churned about like pebbles in a mill-race by the fierce current.

The country the Grand canyon is situated in is a very rough one, thinly settled and out of the beaten paths of travel, and that, with the extreme difficulty of entering it either from above or by the perilous waters below, have conspired to keep one of the greatest wonders of the world a veritable terra incognito. A careful examination of the country and its formation has convinced the writer that the old theory, as taught in our text-books of geology, that the Grand canyon is the result of the erosion of water for many millions of years, and the attempt of some to approximate the age of the globe by calculations based upon the supposed time necessary to wear down 7000 or 8000 feet of stone, is altogether untenable and inconsistent with our present knowledge of its topography. The whole region gives unmistakable proof of once being a sea-bottom, by the water-worn rocks, deposits of salt, fossils, coral, etc., to be found everywhere. It now has an altitude of 500 to 6000 feet, the result of volcanic upheavals, and it is to this that we can look for an explanation of the Grand canyon. This gigantic uplifting of the earth's crust caused huge fissures to occur in the soft sand and silt through which the torrents of escaping waters tore with irresistible fury, gouging out the upper part of the existing channel in a comparatively short time. This accounts for its great width from side to side and also explains the cleavage of the Buskin mountains, which rise 2000 feet above the level of the canyon's banks and could never have been the work of erosion. The basaltic formation in many parts of the canyon, the immense beds of scoriæ known as malapai rock, which everywhere abounds, the silicified forests and the great craters of extinct volcanoes in Northern Arizona, all point to a time of volcanic activity, when those twin monsters of the primal world—fire and water—contended for mastery.

The first stratum of the canyon, which extends down several hundred feet, is a sandstone, next comes a shale or slaty formation, and underneath lies a bed of limestone, which in some places, notably Marble canyon, seem to be much deeper than at others. In this limestone silver is more or less to be found. Next comes a stratum of salt. That near the junction of the Little Colorado with the parent stream has been mined for many years by the Supai, Moqui and Ed City Indians. Below this rock salt comes the primeval granite, hard as adamant and bearing gold in some places.

These canyons have a peculiar interest to the ethnologist, they having once been the home of prehistoric man. Many ruins of these Cliff Dwellers are to be seen, and sometimes a rare find rewards the patient explorer in the shape of unique pottery or curious copper implements, hardened by an admixture of silica, now a lost art. Who were these mysterious people, and what was the cause of their sudden extinction? Whether an awful pestilence swept them into oblivion or the armed hordes of some fiercer tribe tore them from their peaceful homes will always be one of the dark secrets of that strange land. Many of their habitations are almost inaccessible—perched on some dizzy cliff, necessitating the use of ropes to reach them.—*Ex.*

Edison's Latest Phonograph.

Mr. C. E. Norton, who has been associated with Mr. Edison in his laboratory, is now in this city, as agent for the introduction of the improved phonograph. He has given a large number of exhibitions of this wonderful machine in the presence of public associations and private parties in this city. In every case his exhibitions produce great surprise, perplexity and admiration, at this, one of the latest of the many wonderful achievements which the seer of Menlo Park has given to the world.

At every exhibition, his audience, whether great or small, hang over the mysterious machine and eagerly drink in the music of brass bands, the glowing words of our leading orators, and the melodious voices of some of the best songsters of the country. Eleven rubber tubes are connected with the phonograph and as many persons listen to each piece. Faint intonations can also be heard by an entire room full of listeners, even without the aid of the rubber tubes for conveying the sounds to the ear. The cylinders which reproduce the sounds are covered with wax instead of tinfoil, which was used in the early phonographs. This wax is specially prepared by being heated to 900 degrees. Each impression on the wax will reproduce 5000 times and can be used for 100 impressions.

One of the features of the machine is a knife which shaves off any impression when desired. Edison is now at work on another kind of wax, in which really lies all the secret of the invention. He is trying to get a flat sheet of wax, which, after being impressed, can be folded up, put in an envelope and sent to any part of the world and there reproduced, as was done with the tin foil.

One difficulty to be overcome in these will be the creases, but Mr. Edison has struck on a tiny platinum ball, which can go over them and yet not lose a single word. When this feature is accomplished, it will probably supersede stenography, and can be used for amusemen as well as convenience.

The wax impressions are capable of being electrotyped, so that the utterances of great orators and the sweet sounds of famous singers, as well as the more inspiring airs of military bands, can be reproduced a countless number of times for the delectation of audiences thousands of miles away.

Edison is now endeavoring to produce a machine, both perfect and cheap, so that it can be in the hands of everybody for use as a correspondent, stencgrapher, and for amusement.

We understand that these machines are not sold, but are leased to parties for a stated sum per month, as is done with the telephone.

To Tell the Weather.

Benjamin Franklin was the first to discover that storms in this country travel from west to east. He was interested in observing an eclipse, and found that while the observations were spoiled in Philadelphia by a rainstorm that came on just at the beginning of the eclipse, the sky was clear at Boston until after the eclipse was over. By communicating with intervening towns he learned that the storm traveled eastward at a uniform rate. Simultaneous observations taken in all parts of the country show that nearly all great storms follow the same general direction—from the west to the east. The same is true of cold or hot waves. Therefore, to tell what the weather will be, in advance, we have only to find out the conditions prevailing west of us. This is practically the course pursued by the signal service.

The direction of a storm is frequently diverted by some local cause. A low barometer, or large amount of moisture in the air, attracts a storm, and may either change its course entirely or hasten its advance. The rate at which a storm travels between two points is, in fact, calculated by the gradient or decline of the barometer from one point to the other. When a storm is advancing, the wind blows to meet it. Thus, a wind blowing from the east or southeast indicates the approach of a storm from the west. When the storm center has passed, however, the wind changes and follows the storm. If a person has a good barometer and a wind gauge, he can tell pretty correctly when a storm is coming. Without the instruments the clouds may be watched, and when seen to be moving rapidly from the southeast, and there are indications of the presence of much moisture in the air, a storm is not far away. The old Scotch saying that

> A red sky at night is the shepherd's delight,
> A red sky in the morning, shepherds take warning,

Is partially true in this country. The red sky in the morning indicates an excess of moisture in the air, and a storm is therefore likely to occur before many days.

The circle around the moon, or lunar rainbow, shows the presence of moisture in the air. Moisture at a high altitude produces a large bow and at a low altitude a small bow. The smaller the bow, therefore, the nearer is moisture, and, consequently, the sooner will the storm develop. The old saying that the number of stars to be seen inside of the circle indicates the number of days before the arrival of the storm is not reliable, as the position of the moon in the heavens may make the number great or small without regard to the storm conditions. All attempts at predicting the weather for months in advance are mere guesswork. Such superstitions as trying to foretell the severity of a winter by the thickness of the breastbone of the goose or the fur of animals originated in some obscure quarter, and are not worth the circulation and attention that they receive.—*Prof. Daniel Draper in Chicago Inter-Ocean.*

A CURIOUS REGION.—The State of Florida presents some of the most curious phenomena in regard to its rivers and lakes of any State in the Union. One of the latest discoveries is that of a subterranean passage in the Santa Fe river, three miles northwest of High Springs. A spot about 14 feet in diameter has been found having no bottom. The water in this particular locality is unlike that surrounding it, having a decidedly bluish cast. Rails pushed a short distance down into this hole disappear, never to return. All attempts to find bottom have thus far failed.

BRIDGE OSCILLATIONS.—A number of seismograph observations of value have been made on the new Tay bridge by Prof. Ewing of the Dundee College. The instrument, which was placed on the southernmost portion of the great girders, records the vibration during the whole time a train is on the bridge; and it appears that as the train comes on at the Dundee end, 1½ miles away, oscillations of 1-500th inch are observable, increasing as the train advances to a maximum of one-half inch.

GOOD HEALTH.

Health of the State.

The monthly circular of the State Board of Health for June gives reports from 80 towns, with an estimated population of 728,700, showing a total mortality of 854, which is a percentage of annual mortality of 14.04, an exceptionally small death rate, and indicates how little serious sickness was present within the State during the month of June. Consumption is credited with 139 deaths, less than the usual monthly mortality. Pneumonia—The number of decedents from this disease decreased to 35, or 20 per cent from the previous month. Bronchitis caused 18 deaths, which is a slight increase. Congestion of the lungs is credited with 16 deaths, the greater number occurring in young children. Diarrhea and dysentery were the cause of 23 deaths, which, while a decrease from last report, indicates a great frequency of these diseases. Cholera infantum was fatal in 22 instances, which also shows increasing frequency of the disease.

Diphtheria was fatal in 26 instances. Croup was fatal in six instances. Whooping cough, although quite prevalent, and in some places epidemic, only records three deaths as a result of the disease, which indicates an unusual mildness of its type. Scarlet fever caused five deaths. Measles was fatal but in two instances. Smallpox caused no deaths. Typho-malaria fever, although reported as prevailing, caused only one death in San Francisco.

Typhoid fever is credited with 31 deaths, which is an increase of ten over last report. Remittent and intermittent fevers caused one death in Marysville. Cerebro-spinal fever is credited with causing six deaths. Erysipelas was fatal in four instances.

Cancer has caused 42 deaths, the very large increase of 17 over last month's report. Heart disease is credited with 51 deaths. Alcoholism was fatal in six instances. Thermic fever, or heat apoplexy, is credited with causing two deaths in Stockton. The particulars of these cases were not received. No other deaths from this cause are reported within the State.

Reports of sickness throughout the State indicate that a minimum amount of disease prevailed during the month of June. If before the warm days and nights come upon us we would see that our cities, towns, villages and dwellings were properly cleaned and divested of all possible sources of corruption—that our drinking water was pure and our air untainted by human filth, then even extremes of temperature would have very little effect in engendering disease or shortening our lives.

The Prevention of Disease

Is an object which should engage the attention of health boards and health officers throughout the State. Without the greatest vigilance on their part, disease will continue to enlarge our mortality lists and cast reflection upon our sanitary progress. Nurses and physicians attending diphtheritic patients should avoid, as far as possible, the infection of their persons and clothing, several cases having been recorded of the conveyance of the poison by those parties, they themselves remaining well. Where diphtheria is prevalent, parents should daily inspect the throats of their children before sending them to school, and if any inflammation appears they should be kept at home, as it is these cases of mild diphtheria that are the most common source of propagating the disease, being allowed to mingle with other children, drink out of the same cup, play with the same toys, and even kiss each other, without fear of consequences. No parent is justified in sending children to school when infectious disease is present in his house, no matter what its character.

Bath-Rooms for Schools.

Wisconsin educators and newspapers are discussing a proposition to establish baths in the public schools.

This might be urged on purely hygienic grounds in nearly every city, and good reasons for establishing such baths be fully proven; but the fact still remains that every man has a right to administer to his own health. Be such arguments, says a writer in the San Diego *Union*, as they may: I want to use a few inches of your columns in setting the value of such public baths in a different light, which is, if people don't bathe all over with soap and water as often as once a week, they emit an offensive odor that renders them unfit associates for wholesome people. Those who live with non-bathers are often accustomed to such odors and the thing is overlooked; but such people have no right to foul the air for those who are forced to associate with them, as in schoolrooms.

This sickening odor is not only met with in schoolrooms, but in public libraries, Y. M. C. A. rooms, churches, lodges, parties, balls, and in most all places where people congregate. Although, perhaps, San Diego may not have more than its proportion of non-bathers, yet it is less excusable here than in a cold climate, where the shock of putting very cold water on the warm body is by non-bathers considered unhealthy, and where they are poor, they cannot afford, perhaps, to supply hot water to please those they come in contact with. There surely is no reason why a person living in San Diego, where an abundance of semi-warm, soft water is at the hand of every man, woman and child, with soap at five cents a cake, should go about reminding one of the cry of Ben-Hur's mother: "Unclean! unclean!" They should not wait until some person next to them moves or changes his seat, or some one refuses another dance, or to wonder why their presence is not sought, but should bathe regularly, as often as once a week. Of course this is a question that a man cannot talk of to a man who reminds him of the subject, as the non-bather feels insulted, although he feels no compunction about carrying his nauseating presence into the society of hundreds. The schools would seem to be proper educators in this important branch.

Regular and constant bathing should be followed. If not from any selfish motive derived from feeling clean, saving laundry money, warding off disease, and being stronger and healthier than from your love for your fellowmen, bathe, and try and have the children taught to bathe.

DANGER FROM SCARLET FEVER.—The imperative need of burning everything that cannot be thoroughly disinfected which a scarlet-fever patient has used is fully illustrated by the following incident when that dread disease was undoubtedly communicated by a book which had been carefully laid by for 26 years. The Boston *Post* says: In 1846 a boy of eight years, the brother of the narrator's wife, was taken down with scarlet fever and died. One of the principal amusements of his illness had been looking over a large picture-book. After his death this, with several other useful playthings, was packed away in a trunk. Twenty-six years later, in 1872, the sister-in-law of the editor took this trunk with her on a journey which she made to England, where he was then residing. The trunk was opened the second day after its arrival and the picture-book was taken out and presented to the editor's two-year-old son. During the next fortnight the little fellow was attacked by scarlet fever. It was a wonder to the doctors who were called in consultation how the disease had been contracted, as there had been no scarlet fever in the town for years. At last it occurred to the editor that the picture-book might have transmitted the disease, and the medical men in attendance, on being told the facts connected with it, agreed that it had retained the poison for 26 years and communicated it to the child.

THE London *Medical Press* says there is talk of applying telephones to the infectious wards of the French hospitals, so as to enable the sick people isolated in their contagious sufferings to have the comfort of hearing their relatives' voices without any risk of conveying infection by an interview.

THE BRAIN of the late Laura Bridgman, the blind, deaf and dumb girl, is undergoing a microscopic examination at the hands of Dr. Donaldson at Clark University, Worcester, Mass.

USEFUL INFORMATION.

"The Latest."

The latest fashionable idea is for black silk underwear. To buy a pair all made is expensive, but one can make them at home at a less cost. Get four ounces of Heminway's underwear silk; this is made specially for the purpose, and comes in cream white, light pink, salmon, lavender and black shades, and is 60 cents an ounce skein.

Cast on 99 stitches and knit across plain. Use No. 8 needles of bone, rubber or wood.

Second row—Narrow, knit 2 plain, make 1, knit 1 plain, make 1, knit 4 plain, slip second stitch over third, and repeat 11 times.

Third row—All seam knitting. Repeat second and third rows until you have four rows of open work.

Now knit 6 times across in plain knitting, then 4 rows of open work, 6 rows of plain knitting, 2 rows of open work. Then knit in ribs 4 plain, seam 4 alternately, until you have finished 75 rows or a little more if you wish, then seam where you knit 4 plain, and knit plain where you seamed 4 for 4 rows (count the rows on the right side), reverse again for 4 rows; this finishes two blocks. Bind off all but 12 stitches, knit 36 rows plain knitting for shoulders. Now knit the other half of the undervest the same way, and sew together to first block, then sew the shoulders down to the back half. Crochet a row of holes round neck and sleeves, and finish off the holes with a shell edge. Run ribbon in holes and tie in a bow.—*Chicago Inter Ocean.*

THE YEAR 1900.—Although the year 1900 will be divisible by four, still it will not be, as is usually the case, a leap year. Twelve years must elapse before the interesting event takes place; but it was just the same in 1800 and 1700, but not in 1600, for that was a leap year, and the year 2000 will be a leap year also. Why this should be is a problem. To explain in detail would be a tiresome task, but it rests upon the principle that a difference of 11 minutes per day exists between actual time and calendar time. Thus, a year is computed at 365¼ days, three years being 365 days long and the fourth year 366 days. In fact, the year is 365 days, 5 hours and 45 minutes long, or 11 minutes short of 365¼ days. The leap year every four years is said to have been an invention of Julius Cæsar's. To allow for this difference of 11 minutes per year, one leap year was dropped every hundred years. But this was found not to be exact, and Pope Gregory XIII in 1582 made an improvement and decreed that every centurial year divisible by four should be a leap year. Thus, by omitting the leap year for three centurial years and letting it remain as usual on the fourth centurial year, a system is obtained so close that it would take thousands of years to make up another day's difference in time. The calendar time is still not exact mathematically, but as no change will be necessary for 4000 years, it will not fail to the share of the present generation to correct the discrepancy.

METALIZING AND POLISHING WOOD.—The wood should be steeped in a bath of caustic alkali for two or three days, according to its permeability. The temperature of the bath should be from 164° to 190° F. This done, place in a second bath of hydrosulphate of calcium, to which a concentrated solution of sulphur has been added, in which it should remain 24 to 36 hours. A third bath should then be used of acetate of lead, at a temperature from 95° to 120° F., in which the wood should remain 30 to 50 hours, according to its permeability. Then after being thoroughly dried it is in a condition to be polished with lead, tin, or zinc, as may be desired, finishing the process with a burnisher. This done, the wood apparently becomes a piece of shining, polished metal, with a hard, smooth surface; but, unlike metal, it is not affected by moisture.

THE OILING OF ROUGH WATER BY SEA BIRDS. The English *Army and Navy Journal* prints a letter from a naval officer, who suggests that the ancients, who knew the value of oiling troubled waters, learned this method from observing sea-birds. All the fish-eating birds, cape-pigeons, petrels, and the like, eject oil from the mouth when captured. In the South Atlantic and South Pacific sea-birds have been noticed floating in spaces of comparatively quiet water when the sea around was rough. The unusual smoothness of the water was evidently due to considerable quantities of oil deposited by the birds.

TO WARM ROOMS.—A simple stove for warming rooms by means of solar heat has been contrived by Prof. E. S. Morse. It consists of a shallow box, having a bottom of corrugated iron and a glass top. This device is placed outside the building, where the sun can shine directly into it. The rays pass through the glass and are absorbed by the metal, heating it to a high temperature and warming the air of the box. The air, which on sunny days rises to 90° F., is conveyed into the room to be heated.

GOPHERS are so numerous in Dakota that they are a great nuisance to farmers. Frequently little animals get in a field and spoil a day's labor of the husbandman by digging up the corn which he has just planted. A South Dakota man has hit upon the expedient of smoking his seed corn, and he says the gophers won't touch it. He puts it in a sack, hangs the sack in the upper part of a barrel, then builds a smudge in the barrel and smokes it just as he would a ham.

OIL OF LAVENDER WILL KILL MOTHS.—Oil of cedar may kill moths, in fact one would think that it must kill them, for it makes any human creature who smells it long to die; but if, as it is asserted, oil of lavender will do the same thing, why not use it? Lavender always smells fresh and clean, while a closet in which oil of cedar has been used is only one shade less intolerable than one which has been drenched with benzine.—*Boston Transcript.*

TO EXPEL MOSQUITOES, the *Scientific American* advises, take of gum camphor a piece about one-third the size of a hen's egg and evaporate it by placing it in a tin vessel and holding it over a lamp, taking care that it does not ignite. The smoke will soon fill the room and expel the mosquitoes, and they will not return even though the windows should be left open all night.

TWIN CHICKENS.—A curious feature in ornithology is reported from Eskington, Yorkshire, England, where a hen has hatched two chickens from one egg, both chickens being in a perfect state, except that they are joined together on one side of the membranes of the wing. Beyond this, they walk about and feed in the usual manner.

NEW ARTIFICIAL FUEL.—An Indiana man grinds cornstalks and coarse prairie grass, moistens them with water, reduces them to a coarse pulp, and then subjects the mass to heavy pressure, compressing them into blocks 12x4 and 4 inches thick. These, when thoroughly dry, furnish more heat than ordinary bituminous coal.

A YOUNG BRICKLAYER.—Down in North Carolina an eleven-year-old son of the boss brick mason is earning his $2.50 a day. He is at work on the outside of the wall where none but experts handle the trowel.

THERE are more paper-mills, running more machines, in the United States than in any other country in the world. Germany has nearly as many, but no other country has half as many.

ELECTRICITY.

Arc vs. Incandescent Illumination.

A dispatch from Galena, Ill., reports that "after four months' trial, the incandescent electric-light system, introduced here for illuminating the streets and public buildings, was rejected by the City Council." The alleged cause is "the inferiority of the light." It seems to be quite well understood among electricians that the arc light is the best yet discovered for illuminating purposes, and is properly receiving a general investigation as to its merits.

In this connection the question has been raised, "In what manner and to what extent the size of the carbon affects the results in a current of given strength, covering, of course, in the general question of conductivity, the all-important results of light and life." This question is thus specifically answered in a thesis by Louis B. Marks of Cornell University, as reported in the *Electrical World* of July 6th:

"The conclusion has been drawn from a multitude of experiments that with carbons of the same manufacture and type the life of the carbon varies directly with its diameter and inversely with its resistance. Thus, the life of a one-inch Brush carbon having an actual diameter of .986 inches and a resistance of .061 ohm is, according to test, 26.15 hours. According to the law above stated, the life of a five-eighths inch Brush carbon having an actual diameter of .618 inch and a resistance of .0735 ohm would be by calculation 13.62 hours. When put to test, this carbon burned 13 64 hours. Many other examples might be given here, but lack of space prevents. In the law stated above it is understood that the relation holds true only when the current and the difference of potential between the terminals of the lamp are kept constant in all cases."

This thesis, says the same paper, "embodies the enunciation of an important law connecting the life of the carbon with its sectional area and resistance, and, in addition, brings out the effect on the light-giving efficiency of molded and forced carbons when burned on 'low tension' and 'high tension' arc systems. From the law, as given, it follows that copper-plated carbons, being of lower resistance than the unplated, are longer lived, and this well-known fact is again affirmed by direct experiment."

A NEW IDEA IN ELECTRIC CARS.—A line of electric street cars on an entirely new system is soon to go into operation in Pittsburg. The idea is to propel each car independently without a cable, without a slot rail or any overhead wires, or even a central station and power-house. The vehicle is a combination car, of which the one part is occupied by the passengers and the other by the motive-power. The latter consists as the prime mover of a gas engine, tanks filled with condensed gas and a dynamo. The electric motor, however, will be placed under the second part. The tanks will be filled with a sufficient amount of condensed gas to keep the engine supplied for 15 or 18 hours. The little gas engine in the front part of the car is connected with the dynamo and the dynamo with the motor. Each car will be fitted up in the same manner and run independently. All that is required is a filling of the tank in the morning before the cars start out, and then they will run for the whole day without interruption.

THE SECONDARY BATTERY IN TELEGRAPHY.—The secondary battery, says William Henry Preece, F. R. S., is proving very useful in telegraphy in England. All attempts to use dynamos direct for telegraphic purposes have failed, but their use indirectly, by means of secondary batteries, has been eminently successful. At the General Postoffice in London, there are 220 circuits thus worked from only 38 cells. The currents used for telegraphy are very minute compared to those used for electric lighting; .05 ampere, or 50 millamperes, is a large current for such a purpose. Thus, the current that would light one 50 watt glow lamp will work 10 telegraphic circuits. The secondary cells are applied thus: 20 cells supply motive-power for Delany multiplex distributors and 120 single needle circuits; 18 cells, or two parallels of nine cells, provide currents for 100 direct inker Morse circuits.

ELECTRICAL TRANSMISSION.—A large New Hampshire cotton-mill, near Manchester, is going to adopt the electrical transmission of power. It will be brought from a water-power about one mile from the mill. This mode of transmission is being extensively used in this city and State. A large company was recently incorporated in this city for furnishing such power through the medium of dynamos, which they are prepared to furnish of any amount of power from one-horse or less up to hundreds of horse-power.

IT IS STATED that lightning has already been known to strike overhead electric-light wires and discharge itself through the dynamo to earth, to the imminent danger of the machine.

CAPTAIN BELL of the steamer A. B. Field recently reported at Astoria that he had found a cod bank about eight miles from Nestucca, which is near the promontory of Cape Lookout, on the Oregon coast, 60 miles south of the Columbia river. The cod were found in great numbers, were large and of excellent quality,

TABLE OF CONTENTS.

EDITORIALS.—Artesian Water Supply, 61. Passing Events; Silver's Influence on American Wheat; A Curious Gold Mine; Cable-Grip Improvement; Stalactites in Mines, 68. The Rainbow Lode, 69. Percentage on Milling Ore; Mining Personals, 70.
ILLUSTRATIONS. Flume on the Gage Canal, Riverside; Artesian Wells and Aerating Reservoir of Riverside's Domestic Water Supply, 61. Geological Features of the Rainbow Lode, Montana, 69.
CORRESPONDENCE.—Copper Mines of Calaveras County, 62. Mines of Northern California, No. 7, 70.
MISCELLANEOUS.—Fragments of a Comet; Imported Silver Ores; The Force of Natural Gas; Car Samples and Mill Returns; The Oldest and Largest in the World; Personal, 62. Two Scenes in Fruit-Drying; Alaska Mines; Forestry and Irrigation, 63.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming. 64-5.
MECHANICAL PROGRESS.—Nails From Tin Scrap; Forging by Pressure or by Blows; The World's Progress in Iron and Steel; American Plate Glass; A Still Mooted Question; Enormous Engines, 66.
SCIENTIFIC PROGRESS.—The Grand Canyon of the Colorado; Edison's Latest Phonograph; To Tell the Weather; A Curious Region; Bridge Oscillations, 66.
GOOD HEALTH.—Health of the State; Bath-Rooms for Schools; Danger from Scarlet Fever, 67.
USEFUL INFORMATION.—"The Latest;" The Year 1900; Metalizing and Polishing Wood; The Oiling of Rough Water by Sea Birds; To Warm Rooms; Oil of Lavender Will Kill Moths; Twin Chickens; New Artificial Fuel, 67.
ELECTRICITY.—Arc vs. Incandescent Illumination; A New Idea in Electric Cars; The Secondary Battery in Telegraphy; Electrical Transmission, 67.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 72.

Passing Events.

The Mining Stock Association is protesting against the system of ore milling on the Comstock, where so small a percentage of assay value is returned on ore milled. It is about time this matter was vigorously attended to, for there is little doubt that stockholders do not get the returns they should.

It seems that, in addition to the leaching works, Col. Ranlett will shortly put up smelting works at the Newton Copper mines in this State. He has lately been investigating this subject thoroughly.

The Lick Observatory will send an expedition to South America to observe the eclipse of Dec. 21, 1889.

The fact that the superintendent of the Oakland Electric Light and Motor Co., this week, through accident, sustained an electric shock, far beyond that before considered possible, and yet recovered, will still further increase the interest in the subject of executions by electricity.

THE American workingmen's expedition, under the auspices of the Scripps League, started for Europe this week. When it was announced that the British Government would send 100 British workmen to the Paris Exposition, it was hoped that Congress would do likewise, but it did not. Thereupon the newspaper men took up the scheme and soon arrangements were completed for sending 50 workingmen to Europe.

Silver's Influence on American Wheat.

Before entering further into the silver question from its intrinsic standpoint as a leading industry in this country and therefore calling for protection, it is best to explain more in detail why England is opposed to its being remonetized.

Great Britain sees in the Indian rupee and the Russian silver rouble the means by which cheap food can be secured for her toilers in the manufacturing centers, and at the same time give employment in its carriage to her merchant marine. In the London *Standard* of May 19, 1888, the following appeared: "India has no longer the commanding position in the wheat trade which her 'monopoly,' it might be called, of a currency depreciating in value gave her. Russia has entered the lists against her, and, thanks to the much greater fall in the exchange value of her paper currency, is now outstripping her. In the first four months of this year the value of Russian wheat imported into the United Kingdom has been 270 per cent more than it was for the same period a year ago. At the same time, the value of our wheat imports from India has declined 76 per cent. Much of this extraordinary turn in the wheat trade is no doubt due to the excellence of last year's Russian harvest, but that merely provided the commodity. It is the fall in the value of the rouble which makes it possible for Russia to beat India this year in the British grain markets." As there are many—far too many for the good of the silver-mining and wheat industry of this country—who do not fully understand the workings of the price of silver on the market values of wheat, we present the following: In 1873, when the United States joined England and Germany in demonetizing silver, the latter sold in the London market at $1.29¼ an ounce fine. The export value of wheat in Calcutta was at that time $1.11 per bushel in our money, or 8s. 7d. sterling in English money. The expense incidental to getting the wheat to Liverpool brought the price to 52s. 1d. per quarter or eight Winchester bushels. It was quoted at about 55s. per quarter in London, and American wheat at 63s. for the better grades. India's export of wheat is given officially at 735,485 bushels for the year 1873. Fifteen years after, or in 1888, the exports of wheat from India were 36,400 260 bushels, valued at 82,827,850 rupees. The export values of the same at the port of shipment averaged $1 11½ per bushel in our money and in English money 8s. 7d. sterling per bushel. But silver having declined from $1.29¼ per ounce fine in 1873 to 92¼ cents in 1888, made the actual cost to the export buyers of the wheat 74 cents a bushel instead of $1.11½ per bushel, as the following illustrates: Silver at par, or $1.29¼, the rupee in England is valued at 2s., but silver at 92¼ cents per ounce fine, the rupee in England is only valued at 1s. 4d. At the latter value, 1s. 4d. per rupee, it only required £5 526 852 to cover 82 827,850 rupees, and as the rupee in India is fully worth 48⅜ cents, and buys its full value in wheat in that country, the profit to England is the difference between 1s. 4d. and 2s., which is 8d., or a little over 16 cents in our money, or a total of $13,779,665. When silver was at par, or $1.29¼ per ounce fine in London, wheat at the port of New York averaged from 1870 to 1875 $1.32 per bushel, and Indian wheat in 1873, at Calcutta, averaged $1.11 per bushel, with silver down to 92¼ cents per ounce fine in London. India's wheat, worth $1.11½ at Calcutta, is paid for in rupees purchasable with gold at 1s. 4d., bringing the cost on a gold basis down to 74 cents, against a silver basis of $1.11½. The decline on a gold basis in Indian wheat caused our export wheat to average in 1888 only about 89 cents per bushel at the port of New York, against an average of over $1 33½ per bushel in 1873, or $1.32 for the five years ending with 1885.

The above is a sad commentary on the insane policy of our so-called statesmen, who virtually make us vassals to England for the benefit of that country first, last and all the time. If our mints were made as free to the coinage of silver as they are to gold, as they were up to 1873, silver would to-day sell at $1.29¼ per ounce fine, as it did from 1792 to 1873, and India's wheat, costing $1.11½ per bushel at Calcutta, would cost in gold, delivered at Liverpool, $1.27½ per bushel, instead of 90 cents per bushel as it now does, with silver 92¼ cents per ounce fine. American wheat at New York, with silver at par, would command all of 41 per cent more than it now does. This advance would go far to enrich our country, raise the mortgages from off American farms, and crown our country with more general prosperity than has been witnessed for several years past.

A Curious Gold Mine.

A Deposit Resulting From Aqueous Action.

The now famous Mount Morgan mine, near Rockhampton, Queensland, was described in the PRESS (with engravings) some years ago, but since that time developments made have given a clearer insight into the mode of deposition of the gold. The deposit presents several interesting features, as may be seen from the following brief description, which embodies the observations of Mr. Jack, the Queensland Government geologist:

The mountain, situated about 30 miles from the sea, is surrounded by a tableland, above which it rises about 400 feet, the summit being 1225 feet, and the average altitude of the tableland about 800 feet above sea level. The country rock consists of a sandstone formation, with occasional masses of hard shale, and in the immediate locality of the mountain it is intersected in every direction with intrusive masses of igneous rocks, such as rhyolite and dolerite. At the time of Mr. Jack's report the geological evidence seemed to prove to him that the mountain has resulted from the upward flow of a thermal spring carrying silicious, argillaceous, and other matter in a semi-liquid, mud-like mass.

The summit of the mountain, when opened out, was found to be a mass of silicious brown hematite ironstone with a stalactite structure, together with what appeared to be a cellular silicious sinter; this had a frothy appearance, and was sometimes light like pumicestone. In one part of the cutting on the summit was found a band of kaolin in various states of purity. Throughout the whole mass gold, exceptionally free from alloy, occurred in the most minute powder, rarely visible to the unaided eye, to the amount of from 5 ounces to 8 ounces to the ton of deposit. It assays 99.7 fine. The alloy is copper, with minute traces of iron, and it is worth £4 4s. 8d. per ounce troy. Quarries lower down the mountain revealed even more complexity in the deposited mass; brown hematite, red hematite, aluminous iron ochre, white silicious deposits, soft aluminite, masses of magnesian and aluminous silicates, and loose silicious sinter, in almost all of which gold occurs similarly and to much the same amount as previously mentioned.

The hillsides formed by the overflow are of like character and carry gold in the same manner as the interior of the hill, but no gold has yet been obtained in the locality which cannot be traced to the influence of the deposit and the surface indications resulting from its gradual denudation. When Mr. Jack examined this mountain for the purpose of reporting on it to the Queensland Government, very little work had been done there. The opinions he then expressed are probably those that any other skilled geologist would form with the same data to judge from. As this great deposit is now well opened out, and much is to be seen which could not have been guessed at when Mr. Jack was there, a different explanation is now feasible to that of the "Thermal" theory then propounded.

In a recently published pamphlet by Florence O'Driscoll, entitled "Notes on the Treatment of Gold Ores," this curious mine is fully described. The author states that recent investigations would justify the classing of the occurrence as a remarkable and unusual development of the following causes as an explanation of the deposits found above decomposing pyritous lodes:

"On certain gold-fields, where the rocks are covered with little or no surface soil, it may be noticed that long lines of brown iron ore (hydrous oxide of iron) cross the field in the direction of the strike of the lodes, sometimes running along the outcrops, in other cases following fissures or cracks on the strike of the rocks containing the lodes; this oxide of iron in many instances may be traced to quartz veins, and is a product of decomposing pyrites."

It seems that this Mount Morgan is the result of aqueous action by which the deposited portions of a large mundic lode beneath have been carried upward and accumulated on the surface. That which appears to be silicious sinter of geyser origin is the silicious skeleton from which granular iron pyrites have been dissolved out by natural causes. Specimens exist where one part of a stone is apparently solid pyrites and the other half sinter. In several instances pieces of the solid parts have been treated with nitric acid and the pyrites dissolved out; then a framework of iron-stained silica was left, not to be distinguished from silicious sinter of thermal origin.

Investigations have revealed the existence of a large pyrites lode underlying the deposit, but this is not yet worked for gold.

Within the last five years gold to the value of several millions sterling has been extracted from the ore taken out of the workings of this mine, and as far as can be judged from these investigations, the mountain throughout is a mass of heavily charged gold-bearing deposit; its value is still undeterminable because of the difficulty experienced in obtaining data as to depth and extent.

Cable-Grip Improvement.

Henry Root of this city has obtained a decree in his favor in the U. S. Circuit Court of the Southern district of New York against the Third Avenue Railroad Company for infringement of patent on a cable grip. This decree includes a permanent injunction restraining the company from using the grip, and also an accounting of the profits of the defendant corporation and the damages suffered by the complainant on account of the infringement. The patent in controversy in this case was the one granted to Wm. Eppelsheimer, March 16, 1875. The specification describes and the drawings show a gripping device provided with two jaws, one fixed and one movable, the lower one of which is caused by suitable mechanism operated from the car to advance toward the other and grip a cable moving upon pulleys between them, and to recede and release the cable. The transverse bar has vertical rope-supporting pulleys, one at each end, so located and arranged that the movable jaw can be raised and lowered between them and carry the cable resting on the pulleys into contact with the fixed jaw when it is raised, and release it when the jaw is lowered so that the cable will rest on the pulleys. The bar is a longitudinal frame to which the pulleys are journaled and held in a fixed relation to the movable jaw.

In the decision Judge Wallace said: "The Hallidie patent is the nearest anticipation of the invention claimed which is shown in the prior state of the art as exhibited by the record. Except as showing devices which perform in combination the function of the combination of the claim, it is of no value. The other patents in the record, which have been adduced by the defendant for the purpose of negativing novelty, do not merit attention. * * * The real question in the case is whether the gripping devices of the defendant, which discharge the same function, are substantially those of the patent."

The judge then goes on and describes the difference between the grip used by the Third avenue road and that claimed by Mr. Root. He said that used by the road was practically the same. "These are merely formal differences. They do not involve any inventive thought and are immaterial as respects the function and mode of operation of the parts of the combination."

Stalactites in Mines.

In the article on the Mount Morgan gold mine, in another column, the statement is made that when the summit of the mountain was opened out a mass of silicious brown hematite ironstone with a stalactite structure was found. One of our correspondents informs us that at the old Ecton copper mine, Staffordshire, England, at a depth of 1000 feet below the surface of the ground, in the gray limestone walls of that pipe vein, caverns were met with sometimes 10 or 12 feet high, with stalactites hanging from the roofs 12 to 18 inches in length. They were semi-transparent, with yellow copper ore in them, having all the appearance of gold. On the floor of the caverns the stalagmites were bedded in beautiful yellow copper ore. The Duke of Devonshire, at great expense, had the contents of one of the caverns taken out and a grotto made of the stalactites and stalagmites at his residence in Derbyshire.

The Rainbow Lode.

Structure of Large and Small Veins.

The Rainbow lode is at Walkerville, about one mile from Butte City, Montana, and was so named by the late J. E. Clayton. It is in Summit Valley district, where millions of dollars in gold have been washed out of the surface gravels below the veins. It is rugged vein gold, no doubt derived from the disintegration of the veins of the district. The lodes were first prominently brought to notice by Mr. Clayton in 1876, and in October of that year the Alice was opened in the central portion of the lode by Marcus Daly. The developments on the Rainbow lode have since been carried on without cessation. Many millions of dollars have been expended and returned, and cities and villages cover the surface which a dozen years ago was in wilderness.

The Rainbow lode was described a couple of years ago by Wm. P. Blake, before the American Institute of Mining Engineers, that vein being a typical example with which he is familiar. We condense from his description a number of facts. On this lode are the Rising Star, Moulton, Alice, Traction, Magna Charta and Valdemere. The country rock is a well-defined gray granite, of even and close grain, with a large proportion of black mica in small crystals, but little quartz, and in some places a little hornblende becoming syenitic. It has no well-defined rift or slaty structure, being apparently eruptive or plutonic in origin, rather than metamorphic. It is much more friable and soft than the rocks of the adjoining range, forming the continental divide.

The conical hill known as "the Butte" has generally been called an outburst of porphyry or trachyte. It is an isolated eminence surrounded by granite. The granite directly west of the Butte is in part hornblendic, and still farther west becomes a coarse aggregate of quartz, feldspar and biotite. At the Magna Charta claim, the dark-colored, hard granite is micaceous and not hornblendic; but some hard outcrops, southwest of the Alice shaft, contain hornblende as well as mica. Small crystals of sphene are common, and minute grains of pyrite are disseminated in the mass of the rock.

Throughout this granitic area there are alternating belts or spaces where the rock appears to weather or decompose faster than in the adjoining portions.

That the granite is extensively traversed by small veins is not only shown at the surface, but on cuttings at the 300-foot level of the Magna Charta. The granite is traversed in every direction by numbers of small quartz veins in nearly straight lines. (See Fig. 1.) They intersect each other and form a network, inclosing blocks of granite from a foot to a yard in diameter. The veins seem to have affected the rock on both sides, though the centers of the blocks are hard, compact, unchanged granite. These narrow veins extend for many feet with an even width, and do not fault or throw each other at the places of intersection. The vertical veins, from one to six inches in thickness, are filled with sulphides, while the highly inclined or horizontal seams are nearly barren. These facts, while interesting to the student of vein formation, have also a practical bearing, being indicative of an extensive fracturing, or, at least, a deep-seated mineralization of the granite.

The lode, taken as a whole, may be described as a compound one, being in some places divided up into two, three, or more contiguous portions, separated by granitic rock in large lenticular bodies, or "horses." The ore masses in the body of the lode are lenticular in form and lie side by side. Where one thins down, another increases in thickness and takes its place, or is replaced by one of the granitic horses. Some portions of the vein mass are thoroughly crushed and broken up; as completely so as if they had been passed through a crusher, while the fragments are partially rounded by attrition one upon the other.

Prof. Blake, in his paper, gives several illustrations of the structure and thickness of the vein at different levels. Fig. 2 shows a cross-section of the Alice at the 700-foot level, where the lode shows a large amount of softening and alteration of the granite on the footwall side. There is also some softening and change in the hanging-wall, as shown by the section across the vein at this level, representing an aggregate thickness of 40 feet of vein. In this drawing 1 represents the granite country; 2, softened granite with small veins; 3, clay wall with decomposed granite; 4, quartz, broken and seamed; 5, clay and decomposed granite; 6, quartz and manganese spar—the "curly ore;" 7, quartz and ore—"hard vein;" 8, soft granite with veinlets; 9, dark-colored, hard granite of the hanging-wall country.

In the Magna Charta and other claims the developments show greater subdivisions of the lode, these parallel veins being indicated, separated by granitic masses. The relative position and the thickness of these veins are best shown by a sketch cross-section (Fig. 3) made by Prof. Maynard and Prof. Blake in 1881, showing the distances and thicknesses, approximately. The general nature of the ore of the vein may technically be divided into two chief classes; the oxidized and free-milling, and the pyritic or sulphurous, which requires artificial oxidation or roasting.

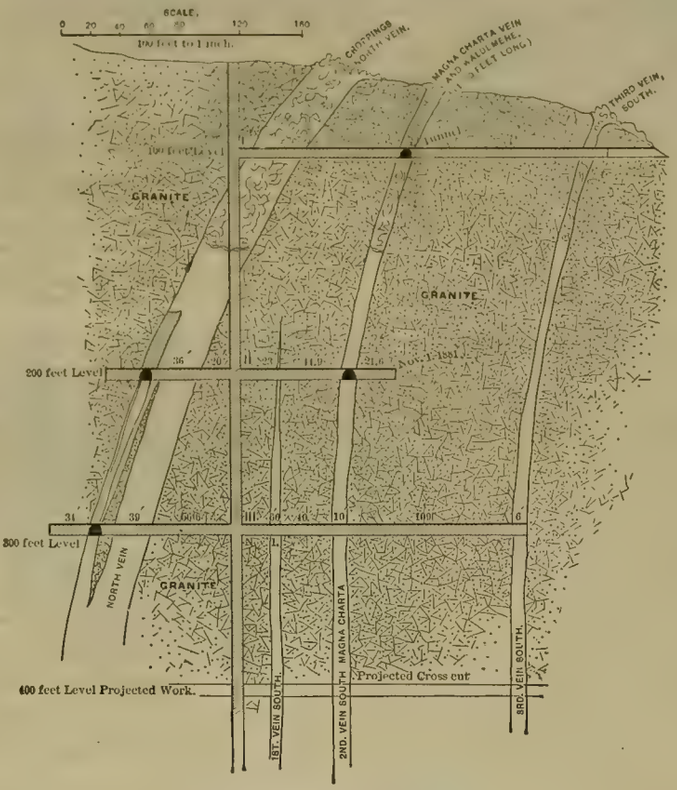

Fig. 3.—Cross-Section of the Magna Charta Mine.

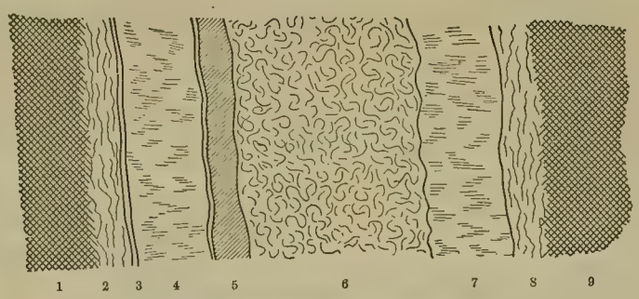

Fig. 2.—Cross-Section of the Lode at the 700-foot Level.

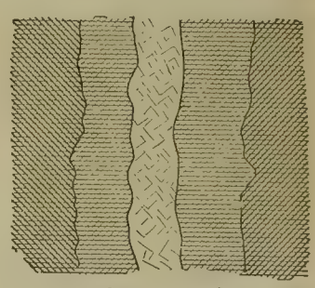

Fig. 5.—Veinlet of Manganese Spar, Bordered by Decomposed Granite.

Fig. 1.—Granite Traversed by Small Veins.

Fig. 4.—Section of a Small Vein.

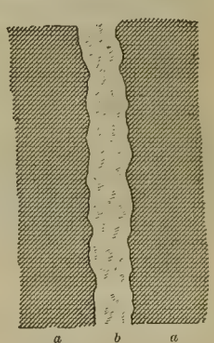

Fig. 6.—Veinlet of Quartz with Ore in Granite.

Pink manganese spar—the species known as rhodochrosite—is the most characteristic mineral of the vein-stone of the lode. It occurs in large quantity in the massive form, and occasionally in good rhombohedral crystals in vugs or cavities.

It is generally much intermingled with quartz, which spreads through the substance of the spar to such an extent as to partly disguise it. Quartz penetrates it also in the form of very thin ramifying veinlets, binding the mass into a very compact hard vein-stone, through which the sulphides are disseminated in minute isolated grooves or in granular aggregations, sometimes forming large bunches of ore. The distribution is usually in sheets or layers, approximately parallel with the walls of the vein. A drawing (Fig. 4) from the edge of one of the side veins or "feeders" of the main lode will illustrate this and show also the general structure of the vein, namely, quartz formed next to the wall-rocks with a central filling of spar and ore.

Gold is also an important element in the ore. It adds considerably to the value of the bullion, and justifies naming the ore a gold as well as a silver ore.

In speaking of the structure of the vein, Prof. Blake says: Manganese spar is sometimes seen in veinlets without a border of quartz. An example was noted on the 1000-foot level of the Alice on a small vein, as shown in Fig. 5. In this, *a* is the granite country; *b*, decomposed granite, and *c* spar. The manganese spar in the center was about one-quarter of an inch thick, and was separated from the hard granite country rock by a selvage or border on each side of decomposed granite one-half to three-quarters of an inch wide.

Another veinlet, on the same level, shown in Fig. 6 (*a*, granite; *b*, quartz) consists chiefly of quartz about three-eighths of an inch thick in the firm granite, with a small quantity of pyritic ore in small grains parallel with the walls.

Such small veins are numerous in the granite near the lode. The structure of these small veins may be considered as a sort of index or key to the structure of the larger ones. It is easy to see that even a very small vein, formed, perhaps, along the plane of the peak or slip in the solid rock, would make a permanent plane of weakness upon which movements of the rocks would take place, and thus tend to increase the size of the vein, and to crush and brecciate the contents and produce clay selvages between the opposite-moving surfaces, whether between the vein filling and the walls or in the midst of the vein, as we find in the Rainbow lode, and in others.

The general type of structure of the lode may be said to be quartz, with a central filling of manganese spar and ore. The alteration o

GEOLOGICAL FEATURES OF THE RAINBOW LODE, MONTANA.

the adjoining granite is interesting and significant. The phenomena favor the view of the origin of the vein and ore from lateral secretion, or rather from the slow flowing of the water contained in the mass of the rock toward a seam, fissure or crack along which the solutions could flow with less resistance than in the capillary pores of the rock. It would seem that the quartz of the veins is derived from the adjoining granite, for we find most of the quartz removed, and even the silicates decomposed, with a loss of at least a part of their silica.

Percentage on Ore Milling.

At the annual meeting of the Savage Mining Co. a protest was entered by certain stockholders against the system of milling the ores from the mine, on the ground that less than 35 per cent of the assay value of the ores is returned to stockholders. It is no wonder that a protest is made, this being the case. The protest is of some interest to owners of stock in mining companies, as it quotes the law on important points that are often ignored by directors, and of which numbers of stockholders are totally ignorant. We append the document in full:

To the President, Secretary and Directors of the Savage Mining Company—GENTLEMEN:—The undersigned stockholders whose stock is represented herewith, most emphatically protest against the ratification of and the continuance of the present system of milling ores for this company on the following grounds, namely: Less than thirty-five per cent (35%) of the assay value of the ores of the mine are returned to the stockholders under the present system, while in years past, and when milling was much more expensive, mill-owners were required by written contract to return not less than sixty-five per cent (65%) of the assay value of ores at the mine to its stockholders. [See contract between Governor Stevenson of Nevada and the Kentuck Mining Company, extending from 1881 to 1888, inclusive, and others of similar nature with other mines.]

And we, stockholders, further protest against the manner in which the superintendent's weekly and monthly statements are made, and demand that the assay value of ores at the mine, as well as at the mill, shall be given under oath, and filed where stockholders can see it, and in accordance with the Act of April 23, 1880. Sec. 1st reads: "It shall also be the duty of the superintendent to file with the secretary a weekly statement, under oath, showing the number of men employed under him and for what purpose, and the rate of wages paid to each one. He shall attach to such account a full and complete report, under oath, of the work done in said mine, the amount of ore extracted, from what part of the mine taken, the amount sent to mill for reduction, its assay value, the amount of bullion received, the amount of bullion shipped to the office of the company, or elsewhere, and the amount, if any, retained by the superintendent. It shall also be his duty to forward to the office of the company a full report, under oath, of all discoveries of ores or mineral-bearing quartz made in said mine, whether by boring, drifting, sinking, or otherwise, together with the assay value thereof; all accounts, reports, and correspondence from the superintendent shall be kept in some conspicuous place in the office of said company, and be open to the inspection of all stockholders."

And, hereafter, that all contracts to mill ores shall be made in writing, and the mill-owners be required to return at least seventy per cent (70%) of the assay value of ores at the mine, in place of such inadequate returns as are now made, based upon the pulp assays at the mills, and in which system of making said pulp assays the stockholders have no one to represent them, thus leaving the mill-owners to do as they please without protest or objection.

From the superintendent's letters for 1888, the only source of information open to stockholders whereby they can get data on milling, we obtain the following:

CAR SAMPLES.		BATTERY ASSAYS.	
June	$ 33 00	June average	$22 00
August	30 00	July "	20 24
September	28 00		
October 15th	50 00	November average	$19 75
November 5th	45 00	December "	18 47
Total	$186 00	Total	$80 46
Average	37 20	Average	20 11

65% of $20.11=$13.07, being the amount per ton returned by the Rock Point mill to the stockholders, or less than 35% of $37.20, the car sample assays.

And we further demand that the Board of Directors of the Savage Mining Company take immediate action, whether legal or otherwise, to recover the balance of the bullion, or the money value thereof, now in the hands of and illegally held by the mill-owner, party or parties who milled the ores.

Refusal or delay to comply with this demand will compel the undersigned stockholders to demand an accounting on behalf of the company. All of which is respectfully submitted on behalf of the Mining Stock Association.

W. N. GRISWOLD,
THEO. FOX et al.,
Committee.

The Northern Counties of California.

[NUMBER 7.]

Origin of the Submerged River-Bed at Gold Bluff.

[Written for the PRESS by JAMES H. CROSSMAN.]

The following paragraph is from Prof. Whitney's "Metallic Wealth of the United States," page 82. The segregation and concentration of gold in its matrix from the surrounding rocks is not confined to any geological age or period. It is due to metamorphic action, particularly when in the vicinity of igneous rocks.

Prof. Joseph Le Conte, in his "Elements of Geology" (a comparatively recent work from which I have made copious extracts with some modifications and changes to suit my views), graphically describes the age, origin and deposition of gold as follows: First, in its quartzose matrix; second, subsequent degradation of the rocky structure by glacial action and the erosive power of water; third, its redeposition with the alluviums filling the troughs of the ancient river channels.

Modes of Occurrence of Gold.

"Gold is found in infinitesimally small quantities in all rocks—granites, traps, slates. * * *

"Chemical and electrical agencies first dissolve and segregate it, redepositing it in previously or contemporaneously filled fissures in the earth's crust, generally in a silicious matrix (quartz) with metallic sulphides. In the Appalachian chain, in the Ural mountains, and in Australia, the slates or schists are metamorphic silurian; in California, in Jura Trias, through all geological times there has been a gradual concentration of this metal."

Sir Charles Lyell, Sir R. Murchison and other distinguished geologists state that up to a comparatively recent period a universally high temperature prevailed from the equator to the Polar circle; that the mammoth mammalian species abound, the Mastodon, Elephas Primegenus and the carnivora of that age, and in all probability primeval man then existed and roamed these happy hunting-grounds; that by some cataclysm of events, possibly the near approach of a comet or from some other cause, the temperature suddenly fell, destroying at one swoop all animated life (a besom of destruction). With a sudden change of climate, the glacial period in the Quatenary era followed, covering the North American continent with a mantle of ice of from 3000 to 6000 feet in thickness, and the whole continent was bodily elevated from 1000 to 2000 feet above its present bed or condition. An arctic region prevailed; glaciers from the polar ice cap advanced southward as far as the Gulf of California, forming immense rivers of ice. The glacial flow as it wended its way southerly and westerly from its immensity of weight, plowed ground and cut through the underlying rocky formation that constituted its bed, scoring deep grooves, channels and gorges in its course, and heaping the accumulated debris in moraines and immense beds as it subsequently receded. At the end of this period the scene changed; a new epoch was inaugurated in the history of the world. "The Champlain" appears with a downward movement or subsidence in the earth's crust or land surface which continued until the vantage-ground was lost—forming a depression of from one to two thousand feet below the present level, crushing and crumbling its rocky structure, resulting in a period of great volcanic activity. Volcanoes and fissures were formed, from which poured forth immense floods of molten material, water and gases, covering the whole slope of the North American continent. The consequent heat rapidly melted this immense blanket of ice and a resultant torrential flow of water followed, coursing seaward through the previously glacial-formed troughs, eroding and cutting still deeper channels, smoothing and rounding the angular fragments of the glacial moraines.

This Flood of Waters

Necessarily formed immense rivers laden with auriferous diluvium—two powerful agencies of disintegration and destruction—the glaciers with an irresistible power grinding and breaking, while the aqueous fluid crushed, sized and concentrated the heavier material and crystalline rocks, which with their metallic contents, gold, platinum, osmi-iridium, titaniferous iron, etc., from their greater specific gravity assimilated and remained in strata or sought the lowest possible levels near the channel's bedrock, while much of the lighter material flowed on and was discharged in the ocean's bed.

This is the history and origin of the immense river that once flowed through this region and discharged into the Pacific ocean at Gold Bluff. The superincumbent

Alluvial Strata

That lies above the level of the ocean, reaching at one point a hight of 936 feet, have been proved by actual workings on a large scale, not only by nature's hydraulic wave-power attacking the gravelly banks of the bluffs as here, but by man's (in comparison) puny invention the "Little Giant," to contain sufficient gold to be largely remunerative when systematically worked by the modern hydraulic process. It is a well-understood fact with the hydraulic operator in the dead-river channels of our middle counties that where the top gravel pays the expenses of its removal by the hydraulic process, the underlying stratum as it approaches the bedrock, rapidly increases in value, and on the bedrock proper nuggets and big chunks abound. That this rich stratum lies below the ocean-level, is no bar to its being successfully worked by shafts and the drifting process. The numerous banks and strata of pipe-clay that lie between these gravelly beds form an impervious waterproof sheet. In Wales, tin mines have been safely worked for more than a mile under the ocean-bed, and so near the surface that the beating, roar, and dash of the waves could be distinctly heard by the miners.

Mining Personals.

John Hughes of Mohave, A. T., has made a very good strike south of Stockton, in that Territory.

Supt. Donnelly of the Eureka Consolidated mine, Eureka district, Nev., is on a visit to San Francisco.

Jacob Abeel, formerly of Dutch Flat, is superintendent of a group of quartz mines at Idaho Springs, Colorado.

Duncan Falconer, foreman of the Wenban mines at Cortez, has been attending court in Eureka, Nev., as a witness.

It is reported in Eureka that Geo. W. Cassidy has been tendered the superintendency of the Eureka Con. Mining Co.

Mayor Doppenheimer of Vancouver has issued a pamphlet describing the mineral resources of British Columbia.

Col. Horace D. Ranlett has just returned from the East. While absent he visited the copper mining districts in Montana.

Frank Satterlee of the Iron Mountain will, it is said, hereafter superintend the Central mine, Old Diggings district, Shasta county.

George M. Pinney of New York has recently been visiting the Young America mine to the north of Sierra Buttes, Sierra county.

Jackson McCracken, the discoverer of the famous McCracken mine, Mohave county, A. T., is now living at Wrights, in this State.

Ex-District Attorney W. D. Long has made a very thorough argument before the Nevada county supervisors on the subject of taxation of mines.

Ross E. Browne, the mining engineer, has lately been making a thorough examination of the artesian-well system in portions of Alameda county.

Henry Horstmayer, an old miner of Canyon City, Trinity county, was found dead in his cabin last week. He was unmarried and had no relations in this country.

W. W. Anderson, formerly superintendent of the Orion hydraulic mine at Iowa Hill, is now manager of the Chooo Hydraulic Mining Co. in the United States of Colombia.

Mr. C. H. Aaron, author of "Testing and Working Silver Ores," "Leaching Gold and Silver Ores," "Assaying," etc., will leave for the mining regions of Honduras in a few days.

A. W. Thurman and F. W. Sperr of Columbus, O., have gone home after examining their mines at Mineral Park, A. T. They intend developing other mines in connection with the Keystone.

N. A. Harris, who was for some time manager of the Big Bend Tunnel Co., Butte county, is now superintendent of the Golden Gate river-bed claim on Feather river, three miles above Oroville.

Aug. J. Bowie, the well-known mining engineer and author of "Hydraulic Mining in California," has of late turned his attention to electrical engineering, and recently returned here from a visit to New York.

Francisco Escobra, a recent graduate of Columbia College, N. Y., has been visiting Nevada county. He is studying up gravel mining, intending to apply his experience at his home in the United States of Colombia.

W. G. Lamb, who has become an expert in operating the Russell process, has gone to Mineral City, Idaho, to start up a Russell leacher for J. W. Young, who had a test made on his ore at Park City, Utah, last April.

August Werner has come from Leadville, Colorado, to Pioche, Nev., to assume charge of the erection and working of the smelting furnace about to be put up at the reduction works there. Mr. Werner, for six years past, has had charge of extensive smelting works at Leadville.

Joe McClane, who died while on a prospecting trip in San Diego county last week, was for many years foreman of the Northern Belle mine, at Candelaria, Nev. Several days prior to his death he had been bitten by a rattlesnake, and drank quantities of whisky to counteract the effects of the poison.

E. D. Boyle, H. M. Gorham, D. B. Lyman, and W. E. Sharon acted as the committee of Comstock mine superintendents to draw up resolutions to protest against the diversion of the waters of the Carson river from its channel during the dry season. It is stated that the farmers have been taking too much water, to the detriment of the mining interests.

Edward B. Campbell, who died at the residence of his brother in Oakland on Sunday, came to California in 1849, and was one of the first men at the famous Rich Bar in Plumas county. In war times he was a member of the famous California Hundred who took part in the Rebellion. He has mined all over the State, and was one of the most prominent prospectors on the coast. His last work was at Collins Camp, Arizona, from which place his brother brought him to Oakland, so he could be better cared for during his illness. Death was caused by pneumonia.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & CO.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JULY 16, 1889.

407,049.—REST FOR BUGGY TOPS—H. H. Allen, Oceanside, Cal.

406,992.—PIPE BENDER—E. L. Burgoin, Los Angeles, Cal.

407,171.—CABLE RAILWAY BRAKE — Oliver Cope, S. F.

407,194.—ROLLERS FOR JUTE MACHINE—H. P. Garland, S. F.

406,909.—SQUIRREL-POISONING MACHINE—W. J. Howard, Mariposa, Cal.

407,080.—LAST—A. M. Leighton, Port Townsend, W. T.

407,081.—LAST—A. M. Leighton, Port Townsend, W. T.

406,925.—FENCE—J. T. Mayhew, Vista, Cal.

407,112.—FILTER—Parmenter & Blackman, Oakland, Cal.

406,966.—MAIL-BAG RACK, ETC.—S. Strange, Los Angeles, Cal.

407,044.—HYDRAULIC DREDGER—J. H. Von Schmidt, S. F.

406,979.—SEWER-GAS TRAP—W. Wallace, S. F.

407,144.—RULER—W. J. Wright, S. F.

The following brief list by telegraph, for July 25th, will appear more complete on receipt of mail advices:

California—George H. Wright, San Francisco, signals for crossings of cable railways; Asa Wells, San Francisco, hoop clamp; Leon P. Garain, assignee of one-half to J. Lafferty, San Francisco, machine for forming bulkets.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CABLE RAILWAY BRAKE.—Oliver Cope, S. F., assignor of one-third to James Otis. No. 407,171. Dated July 16, 1889. This consists of the combination with the car or dummy of a gripping mechanism traveling above and below the slot-irons of the cable tube or tunnel—a mechanism whereby the jaws of the grip may be made to approach each other and clasp the jaws of the slot-irons, or recede from each other so as to release them. It also consists of a mechanism for disengaging the grip-brake at will and a means for detaching and swinging the brake up clear of the slot-irons and the track. It also consists of a horizontal shaft extending across the car-frame, carrying mechanism whereby this grip-brake is operated, as well as eccentrics by which the track-brakes are operated simultaneously therewith.

RULER.—William J. Wright, S. F. No. 407,144. Dated July 16, 1889. This ruler has its upper back surface formed with a longitudinal groove, serving as a finger-hold, and its lower surface or base is formed with a groove, leaving narrow bearing edges, on which the ruler rests, and a round ruling surface on its front, projecting over its base. The object is to provide a ruler having the stability of a flat or angular ruler, its ruling edge possessing the advantage of a round one, the said ruler being readily movable, and with cleanliness, and being easily and accurately held in place without having the holding-hand interfere with the pen.

FILTER.—Chas. H. Parmenter and Geo. V. Blackman, Oakland. No. 407,112. Dated July 16, 1889. The invention consists in a bolt having grooves or channels in its sides and provided with encircling independent disks of cloth or other filtering fabric which are pressed tightly together upon the bolt. The invention further consists in the arrangement and combination of the grooved or channeled filter-bolt with the outer casing and faucets used, and, when required, with a novel purifier.

Ditches Over Agricultural Lands.

EDITORS PRESS:—Will you please state in the PRESS what the laws of this State are at the present time in regard to the right of a mining company to convey water by means of ditch or pipe over or across agricultural lands where the owner of the land objects. There is said to have been a bill passed allowing the right of mining and manufacturing companies to cross over or through agricultural or other lands upon the payment of actual damages incurred. Is this the fact? E. H. SCHAEFFLE.

Mr. Roger Johnson, attorney in this city, whose practice makes him an authority on such matters, says that there is no law giving the right to any individual, mining or manufacturing company, to convey water by means of ditch or pipes across or through agricultural or other lands not belonging to the Government upon the payment of actual damages incurred. He says the courts have decided that no one has a right to construct a ditch through another's inclosure without his consent. He cites 10 California, page 104; 15 California, page 137; 42 California, page 339; and 45 California, page 482.

Mount Greyback.

Professor Davidson has just returned from a reconnaisance trip to the mountains of the San Bernardino range. His principal object was to get the view from the summit of Greyback, situated in San Bernardino county, which is 11,500 feet above the ocean. The greater part of the ascent was made on the hurricane deck of the burro, but the last 1500 feet was done on foot up a slope of 28 degrees, over loose granite bowlders and along the edge of deep snow-drifts. From the summit the view is probably the broadest and grandest in this State because the mountain-mass is almost isolated. To the southeast lies the Coahuila valley, and beyond it the great Colorado desert. Over this low country the mountains of Arizona are visible. To the north and westward is seen the peak of Mount Whitney, distant 180 miles, with the intervening desert of the Mojave. Toward the west are the San Gabriel and Santa Monica ranges, while just to the southward of these ranges lie the broad plains of Los Angeles, San Bernardino and Redlands. The atmosphere was too hazy to see the ocean, nevertheless it is clearly in view in clear weather. The peaks of San Jacinto and Santiago lie to the southward, and in the far distance were seen the mountains on the border of Mexico.

The professor considers this peak the controlling point for the development of the main triangulation of the Coast and Geodetic Survey. He examined all the valleys of this mountain range and traveled more than 100 miles on burros, ascending in all more than 19,000 feet. He visited San Bernardino, Colton, Redlands and Riverside. The latter place impressed him particularly by the wonderful exhibit of miles and miles of orange and oak groves, the beautiful homes and the systematic manner in which water is carried and applied. Here is the fullest exposition of the aphorism of the United States Commissioners of Irrigation in 1873 that water is the life-blood of California. Where the land receives no water for irrigation it is arid and worthless. The line is marked by a fence and by a road. The net yield of the orange lands of Riverside is three to four hundred dollars per acre; the arid lands are worthless. The last year's crop of Riverside oranges yielded $1,200,000, which represents $200 to every man, woman and child in the place.

Professor Davidson found the temperature very warm. Through part of Tulare valley early in the month the thermometer registered as high as 115° in the shade, and he never saw the reading below 90°; but the air was so clear and so invigorating that his daily labor seemed only as a stimulus to more work. He is very enthusiastic over the prospects of the part of the country he traversed. He says there are a million acres visible from Greyback susceptible for the cultivation of the semi-tropical fruits, could they be properly irrigated.

The Hopkins Academy, Oakland, Cal.

In a city of exceptionally fine schooling advantages, the Hopkins Academy of Oakland holds an eminent place. Its history, extending over a period of nearly 20 years, has been one of never-ceasing effort to fulfill the high purpose of its founders in establishing a school that should rank with the best of like educational institutions in the East. In pursuit of this ideal, its promoters have availed themselves of approved modern systems of study, keeping in full step with the progress and spirit of the times. The studies have been carefully arranged and classified with a view to thoroughly fitting the student for entering upon a university course, or to successfully battle with the world in a business career. Due attention is given to physical training, in the gymnasium, under an able instructor, and the best influences of a refined home are constantly brought to bear upon the moral natures of the pupils. The location of the building and grounds is desirable in the highest degree, situated as they are upon an elevation overlooking the city of Oakland and the bay of San Francisco. The cut accompanying the business notice to be seen in another column conveys but a faint idea of the handsome building and elegant surroundings of the Hopkins Academy.

The faculty is composed of W. W. Anderson, A. M., Principal, Latin and Greek; Col. Geo. C. Edwards, Ph. B. (Assistant Professor Mathematics, State University), Senior Mathematics, assisted by Chas. H. Clarke, A. B., C. E. Dascomb, A. B., Miss Frankie E. Anderson, Miss Mollie E. Conners, Otto Fleissner, Miss Ethel Anderson, Howard Mudie, Instructor in Gymnasium.

NEW BRANCH HOUSE AT CHICAGO.—The Lidgerwood Manufacturing Co., 96 Liberty street, New York, have found it necessary, owing to the constantly increasing demand for their celebrated hoisting machinery, to establish a branch house at Chicago, where they can deal directly with their large Western trade. They have just opened such an establishment at 34 and 36 W. Monroe street, that city, where they will carry a large stock of their latest improved machines adapted for all hoisting purposes.

LATE reports from Susanville, in Honey Lake valley, say earthquake shocks continue. One of the shocks threw chimneys to the ground, and a swamp in the vicinity, nearly two and a half miles long, has dried up.

Fish Stories.

EDITORS PRESS:—During the first month of our stay in Lake county, we were inclined to pass these by without notice as "ower-true tales." Since there are so many to confirm and none to deny, you can have them as good as new.

The waters of Clear lake abound with carp, catfish, perch, sunfish and silversides. These run up the streams to spawn in such numbers that they tell of fishing with clubs, throwing them out with pitchforks by the wagon-load, etc. One man reported that he killed 84 fish with his horses' feet and buggy while crossing a small stream with a double team. We saw one place where the waters of a creek had dried up and left nearly half enough fish to cover the ground. In another place fat hogs were fishing along the lake shore. Further up the turkey buzzards held full sway, but were so badly behind with their spring's work that fish enough lay along shore in places to touch one another. In the mountain streams they tell of abulous trout springs. F. S. C.

A HEAVY SHOCK.—Thos. A. Edison, the inventor, in his testimony in regard to the death-dealing quality of electricity this week, thought no one would withstand 100 volts. On Wednesday last Wm. Sharpe, superintendent of the Oakland Light & Motor Co., sustained a shock of 600 volts of electricity, and still lives, notwithstanding the statement of Edison. Sharpe was adjusting a wire in the motor circuit, supposing it was not connected with the current, but he was mistaken and he received the full force of 600 volts of a 20-ampere current. The delivery which he received lights two 30-light machines. Sharpe was knocked down and momentarily paralyzed. His heart ceased beating and his eyes became glazed. In falling he relinquished his hold on the wire. The employes thought he was dead, but soon discovered their mistake, and in a short time had him revived.

ECLIPSE EXPEDITION.—Colonel C. F. Crocker has generously offered to bear the expense of an expedition to Cayenne, South America, to observe the total solar eclipse of December 21, 1889. Messrs. Burnham and Schaeberle have been authorized by the Regents of the University of California to proceed on or about November 1,1889, to Cayenne, and establish at some proper point an eclipse station, and to remain there as long as the proper observance of said eclipse and such other work in connection therewith may make it necessary, not later than February 1, 1890. The director of the Lick Observatory is to prepare general plans and directions for the expedition.

THE Pacific Mail steamship City of New York has been taken to the Union Iron Works, where she will shortly be lifted on the great dry-dock and the work of renovating her will be begun. A new set of boilers, on which the iron works have been engaged for several months past, will be put in position and a general overhauling given her. It is intended to provide the vessel with electric lights and all the new improvements known to shipbuilders. The work will occasion the outlay of $120,000, and will be completed in the course of three or four months.

AT the annual meeting of the stockholders of the Savage Mining Company the following officers were elected for the ensuing year: H. M. Levy. A. K. P. Harmon, Morris Hoeflich, Herman Zadig and E. B. Holmes, Trustees. E. B. Holmes was re-elected secretary and R. P. Keating superintendent. The secretary's financial statement showed an indebtedness of $43,868. The mine produced $30,900 in June.

THE directors of the Stockton State Insane Asylum have awarded the contract for boring a deep gas-well to W. C. Fox for $34,750, the well to be 15 inches in diameter at its top, and at its depth of 3400 feet to be not less than eight inches.

COLONEL HORACE D. RANLETT says that works for smelting process are to be erected at Copperopolis. He also states that the roasting and leaching works are running well and doing excellent service.

THERE are six varieties of salmon in Puget sound: Tyre, Flathead, Silver, Winter, Hoodoo and Chinook. The first-named is the best and the Chinook is the poorest in quality.

THE Calaveras *Prospect* of last week gives a list of the men that have been killed in the Sheep Ranch mine during the last 20 years. It had eight names.

MONTANA mines paid in dividends from January 1st to June 30th the sum of $1,549,250. Of this amount the Granite Mountain paid $1,000,000.

THE city of San Francisco has a total indebtedness of $902,811, while the property of the municipality is estimated at a value of $50,000,000.

A NATURAL GAS WELL has been struck ten miles from Cloverdale, Sonoma county, that flows 4 000,000 feet per day. The gas now goes to waste.

WORK on the new dam in Bear valley, San Bernardino county, will begin on August 10th.

Artesian Water Supply.

(*Continued from page 61.*)

boundaries of the artesian basin of the San Bernardino valley. Upon this he has put down 38 artesian wells, at depths varying from 100 to 500 feet, securing an abundant supply of water. It is brought in by canal and flume. Several large arroyos are crossed by flumes, and there are 16 tunnels on the route. The water enters on the plains of Riverside, nearly 200 feet above the elevation of the canals of the Riverside Water Co. An engraving given herewith gives an idea of the extent and character of the flumes required in a portion of the work. All has been done that the best engineering skill could suggest, and ample means afforded to make the works of the most permanent character.

STOCKHOLDERS' MEETING.

A Special Called Meeting of the Stockholders of the CALIFORNIA AND NEVADA RAILROAD COMPANY will be held at the office of the Company, 320 California Street, Room 12. San Francisco, California, on SATURDAY, THE THIRD DAY OF AUGUST, 1889, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, August 2, 1889, at 12 M. E. A PHELPS, Secretary.

Office, Room 12, No. 320 California Street, San Francisco, California.

Invest while Real Estate is Low.

A Rare Offer for Small Investments in San Francisco.

The following property in San Francisco will be sold at low rates, exceedingly favorable to purchasers who wish to buy for safe and profitable investment.

In Gift Map No. 3. on the east side of Shakespeare street, between Hope and Isabel streets, lot No. 1441. Twenty lots, comprising a whole block, on the south side of California avenue, bounded on the other three sides by Bradford, Standish and Mayflower streets, Nos. 1189 to 1209, inclusive.

In Gift Map No. 4, southeast corner of Islais Creek channel and Chace street, 4 lots, Nos. 1969, 1970, 1971 and 1972. Northwest corner of Chace and Freedom streets, 5 lots, Nos. 1955, 1956, 1957, 1958 and 1959. South side of Napoleon street, east from Bigg street, 2 lots, Nos. 2527 and 2528 North side of Tulare street, east from Bigg street, 2 lots, Nos 2543 and 2544.

Also, 2 lots, Nos 82 and 84, Oakland Homestead Association, situated near Lake Merritt and on the easterly road to Piedmont, near the northwesterly limits of East Oakland. They are 50 feet wide by 100 feet deep, with extra land and frontage in one.

The owners themselves offer the above lots to actual purchasers at bedrock prices, and believe that no other property can be bought in the vicinity for immediate use or for investment on nearly as favorable terms.

☞ Apply to or address H. F. D., care of this paper.

Carbon Paint.

We would call the special attention of our readers to the Carbon Paint advertised in our columns. Among the many patents daily brought to our notice, how few have any real practical value? How many that were heralded as with a grand flourish of trumpets have seemed to die still-born, or barely survive the noise of their christening? But in the Carbon Paint we have a patent that has evidently "come to stay." Not only does it appear to have genuine merits, but it is one that successfully meets a great and growing need on this coast. Tens of thousands of dollars are annually expended in trying to protect the roofs of dwellings, factories, warehouses, etc., from decay, and smokestacks, water-pipe, fire-engines, bridges, etc., from the ravages of the elements with paint of doubtful utility, or that furnishes but a brief protection at best, requiring constant renewals at an increased expense. But here is a paint that the universal testimony of those who have used it for five years, as well as many practical tests here, declare it to be peculiarly adapted to a wide range of usefulness. Of remarkable durability, it is at the same time cheap and convenient for use, being neatly put up in cans ready for the brush. It is said to not only resist the action of sea-fog, salt water, coal smoke, etc., but, owing to its rubber-like elasticity it never cracks or blisters under any extremes of temperature, and when properly applied will last good for years. If one-half be true that is claimed for Carbon Paint, and apparently with justice, thousands of dollars might be saved annually in this city by its use on our wharves, water and gas pipes, smoke-stacks, etc., that yield so rapidly to rust or decay if not protected. The company guarantees that Carbon Paint will never rust or corrode any metallic surface. Those who have used this paint in this vicinity on shingle and tin roofs express themselves as greatly pleased. It makes a very handsome roof.

When the value of the C. P. paint as a protection of all kinds of roofs is fully realized the company doubtless will be kept busy in manufacturing the paint fast enough to supply the demand.

We understand that the company do not claim it to be "fire-proof," but as it requires nearly a red heat to ignite it, taken in connection with its cheapness and great durability, Carbon Paint can well challenge competition as a roof paint for general use.

The well-known character of the gentlemen who control the business for the company is a guarantee that a standard article of good paint can always be relied on.

We are always ready and glad to welcome such enterprises in our midst and to wish them God speed. Mr. J. Stratton, the President and Business Manager, is always ready to send circulars or answer any letters of inquiry.—*S. F. Journal of Commerce.*

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay, Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

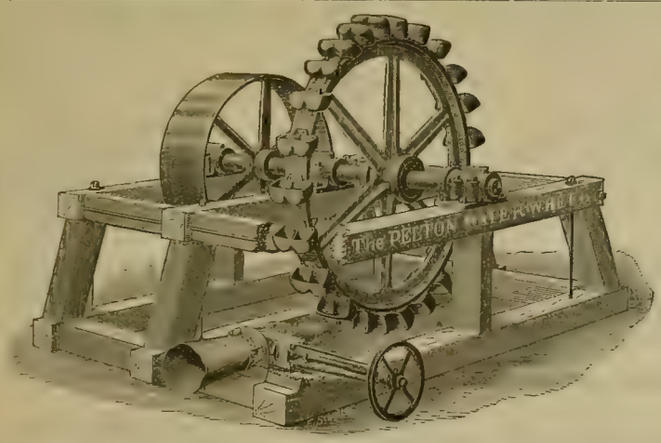
JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.



Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 25, 1889.

General trade the past week was only fair. It is claimed that the volume of goods going out on distributive orders is less than at this time in 1888. The large cereal crops and advancing prices cause merchants to take a hopeful view of the future. The retail trade is reported to be lightly stocked.

In the local market, money still rules easy, notwithstanding light remittances from the interior and a steady increase in the call for funds to move the crops. There is more money going into city realty, but, as a rule, buyers either pay cash or else want small accommodations. The past week there were 55 mortgages recorded, amounting to $125,973. The rate of interest ranged from 6 to 7 per cent per annum. In the speculative markets local securities do not appear to be dealt in to any great extent. The deal in powder stocks, heretofore spoken of, is said to be on, but those who bought in previous deals are not taking a hand now. Having lost once, they do not appear disposed to take a hand again. Wheat futures have been more dealt in. The attractive fluctuations are bringing in more operators. Mining stocks are lifeless. It looks as if the manipulators are trying to wear out outside holders.

The steamer Gaelic, hence July 20th for China, took out the following treasure: To Hongkong, Mexican dollars, 5640.29; gold coin, $16,144; gold dust, $340; silver bullion, $282.000; to Yokohama, Mexican dollars, 50,000; to Hiogo, silver bullion, $100,000; to Calcutta, $16,500. Total, $1,029,013. This is the heaviest shipment made at any one time this year.

The imports of treasure by sea the past week aggregated in coin $11,306.

MEXICAN DOLLARS—The last steamer for China took out 614,029, of which only about one-sixth was sent by Chinese. The price at which the bulk was bought is said to have been 74¾ to 74⅞c for new. The market since the steamer left is quiet, with nominal quotations given at 74¾c for new from first hands.

SILVER—The last steamer leaving for China took out $388,500 in silver bullion, of which $100,000 was for Japan. It is said that the latter country is still in the market for bullion. The delivery of silver bullion to the Carson mint by the Comstock mines has reduced the receipts in this city still less. The shipments by the last steamer cleaned up the market more thoroughly than for some time past. The sales made were at from 92⅛ to a fraction higher. With an advancing market abroad and higher quotations coming through, our market is quotable at 93c an ounce fine. There is more inquiry, but so far as we can learn no sales have been made. It is generally conceded by the better informed that a still higher range in prices will obtain in the near future.

QUICKSILVER—Receipts the past week aggregate 212 flasks. The market is quiet but steady. There was shipped East by rail in the month of June 3874 pounds.

BORAX—Receipts the past week aggregate 625 centals. The overland shipments in June aggregate 2024 centals. There was shipped by sea the past week 1252 centals to New York. The market is firm, with a good consumptive demand reported from the East.

SPELTER—European mail advices report a strong market, with further improvements in prices looked for, owing to a lessened output and a free distributive demand.

LEAD—The market is quiet. Eastern advices indicate a disappointment on the part of dealers in the Treasury not deciding the import duty on Mexican silver ore. The Treasurer seems inclined to the opinion that a decision on the point in controversy should be made only by an Act of Congress.

TIN—The market is quiet, with an easier tendency in both pig and plate. English mail advices report a fluctuating market, with a gradual sinking in values. The output is expected to increase rather than decrease. On July 12th, the prices in London were as follows: Spot, £88 12s 8d; three months future, £89 5s. On July 19th, the closing quotations were: Spot, £88 7s 6d; three months future, £88 17s 6d.

COPPER—The market retains the same uneasy, unsatisfactory feeling heretofore reported, and that, too, in the face of diminishing stocks the world over, under a free consumption. It now looks as if a compromise to form a better pool is as far off as ever. The following are the London comparisons of quotations: July 12th, spot, £41; futures, £40 10s; July 19th, spot, £40 15s; futures, £40.

IRON—The imports of pig the past week were as follows: From Oregon, 17 tons; Irondale, 220 tons. Total, 237 tons. The market, although reported unchanged, has a decidedly strong undertone. The consumption is steadily increasing. The Eastern markets are stronger and quoted at an advance. Manufactured iron at the East is also reported to be doing better. London mail advices state that the advance in America, coupled with reduced stocks of iron in England and Scotland and higher price of fuel and ores, coupled with a good home market, have caused the English markets to strengthen.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow.	July 19,'89.	July 11,'89.	July 18,'88.
No. 1 Coltness	57s 6d	56s	46s 9d
" Langloan	55s	54s	46s 9d
" Summerlee	55s 6d	54s	46s
" Gartsherrie	53s 6d	52s 6d	43s 9d
At Ardrossa.			
No. 1 Englinton	44s 6d	44s	37s 9d
" Glengarnock	53s 6d	52s	42s 9d
" Dalmellington	46s	45s 6d	39s

COKE—The cargo received the past week is being discharged. Some of the large consignees or purchasers are disposed to sell small parcels to other consumers, which has tended to lower prices for spot.

COAL—Imports the past week were as follows: From Tacoma, 5890 tons; Departure Bay, 3400; Namaimo, 833; Seattle, 1758; Coos Bay, 1980. Total, 13,861 tons. The market for spot has been advanced on several grades. This was intimated by us in last week's PRESS. The advance has tended to somewhat check the demand from retail dealers, who, as a rule, look with suspicion on the higher prices asked, particularly with Wallsend steam coal being sold at $6.75 for prompt shipment, and Bulli at $6.50 to $6.62½. Large consumers have taken several cargoes to arrive and for shipment, thus meeting their wants well into January of next year. The coast collieries are turning out the usual quantity, but which will undoubtedly be increased if the market continues to show strength and activity.

The advance in Liverpool steam is due to the C. F. Sargent, one of the three vessels on the way with the coal, putting into port in distress and the fear of the vessel being condemned.

Eastern Metal Markets.

By Telegraph.

NEW YORK, July 24, 1889.—The following are the closing prices the past week:

	Silver in London.	New York.	Copper.	Lead.	Tin.
Thursday	42 1-16	91⅞	$11 90	$3 87½	$19 75
Friday	42⅛	91⅞	11 90	3 90	19 75
Saturday	42⅛	91⅞	11 90	3 90	19 80
Monday	42 3-16	92⅛	11 85	3 87½	19 90
Tuesday	42⅛	92⅛	11 90	3 87½	19 90
Wednesday	42 5-16@42⅜	92⅜	.....	3 87½	.....

NEW YORK, July 24.—The trade in copper is restricted to current wants of customers. Lake and casting brands are heavy. Pig lead is dull, closing mainly at $3.85. Borax is unchanged. Steamer receipts quite supply current wants. Quicksilver is firm and higher; 66@68c; £9, London bid. Considerable activity is shown in whale and sperm oil at New Bedford, but prices are not made public. Tin fluctuates, closing barely steady.

Mining Share Market.

The mining stock market the past week has been flat, stale and unprofitable to all classes of dealers. To buy, an advance had to be paid; to sell, low prices had to be accepted. It looks as if the pool is determined to drag the life-blood out of business, and all on the annual summer cry of neither ore nor water, but plenty of deadwork and assessments. There are some outside operators who think that to collect the present assessments levied on several of the Comstocks, with more to follow, the pool will make a small upward move. While believing this they have no confidence in the stability of values until a still lower range of prices obtains. The writer's experience is that if a person knew the ins and outs of a mining-stock market he would find in it a mint to coin money, and he has also learned that one man's judgment, outside of manipulators, is not any better than another's. Stocks are said to be purposely made scarce to keep outsiders from shorting, and that when the time comes to get shorts they will be made as plentiful as autumn leaves. This Thursday morning there was continued light trading, hardly enough done to make quotations. In the outsiders there appears to be a continued effort to infuse life into the Tuscaroras, but so far without any visible effect. It looks, though, as if some of these stocks were being taken in by insiders. The Quijotoas have been lifeless at blackboard bids and asks. Silver King has been quiet at fairly steady quotations, as has Eureka Con. In the Bodies very little has been done, and that little at declining prices. Mono got its long-promised 50-cents assessment, but the price of the stock has not, as yet, got down to the street points, viz., 60 or 50 cents, neither has Bodie gone down to the $1 point, with perhaps its dropping to 90 cents, or even 75 cents. It looks to an outsider as if Borland and Kelly under the election contest report in June last had peddled out considerable of its stock. But time will tell.

From the mines there is nothing of particular interest to report. The work going on in several of the Comstock mines is being closely watched by mining men, with feelings of confidence that new ore bodies may be run into in the course of the next month or two. From the Bodies, Tuscaroras and Quijotoas there is nothing new to report; all advices are of the same character heretofore reported. From the latter district private information to hand states that in the Central mine, near the Indian Chief group of mines, something important is looked for at an early day. As the mine is gold-bearing, any development there will not be met by a discount on the bullion outturn.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

RISING SUN M. Co., July 19. Capital stock, $100,000. Directors—J. Deming, C. A. Stratton, A. F. Collins, A. F. Johns and G. A. Carter.

FULLER & ANDREW CO., July 19. Object, to do a real estate commission business. Capital stock, $10,000. Directors—F. W. Fuller, J. H. Andrew, W. J. Trott, Wm. Andrew and C. B. Dean.

NIAGARA M. & M. Co., July 23. Capital stock, $500,000. Directors—W. C. B. De Fremery, B. C. Cuvellier, J. L. De Fremery, C. S. Wheeler and L. M. Hoefler.

SAN FRANCISCO CON. OIL CO., July 24. Capital stock, $1,000,000. Directors—W. Fern, W. S. Bell, H. L. Garfield, T. E. Atkinson and H. K. McJunken.

LOS GATOS CANNING CO., July 24. Capital stock, $60,000. Directors—W. G. Beck, Irwin Ayres, F. H. Green, R. N. Simpson and W. T. Gorham.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, July 20, $42,935; Hanauer, 17, $4250; Ontario, 17, $33,850; Hanauer, 19, $3550; Queen of the Hills, 20, $1300; Hanauer, 20, $4600; Justice, 23, $4259; Commonwealth, 23, $13,000; Standard, 23, $8771.

THE property loss at Johnstown is now fairly fixed at $8,655,714. In the first confusion of the disaster it was put at $60,000,000.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

—THE—
PERFECTED
DOUBLE
Economic
Quartz
Mill.

Attached to each Mill is an effective
Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,
AND PORTLAND, OREGON.

MANUFACTURERS OF MINING AND SAW MILL MACHINERY.

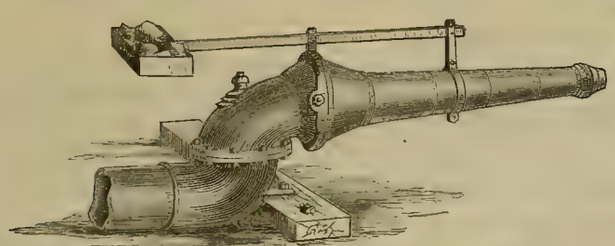
ELECTRIC LIGHTING.



Electric Motors. Electric Railways.

SAMUEL H. TAYLOR, General Agent,

234 Montgomery Street, - San Francisco, Cal.

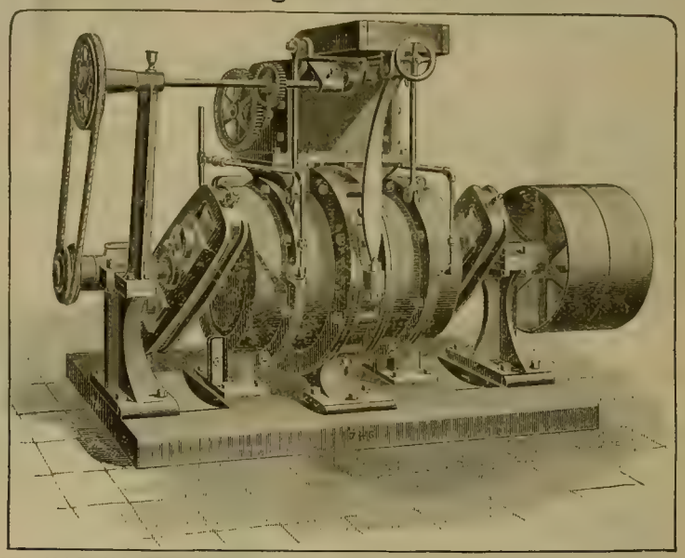
Estimates Furnished. Catalogues Sent on Application.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

CITY HOTEL.



Sonora, - - - - - - Tuolumne Co., Cal.

HEADQUARTERS FOR MINING AND TRAVELING MEN.

Office of all Stage Lines leading out of Sonora. Fine Bar, Billiard, Reading and Sample Rooms. Everything first-class. Terms reasonable. C. S. FITCH, Proprietor.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, cotaining six months' numbers in each, indexed, can be had at this office at $4 per volume.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.

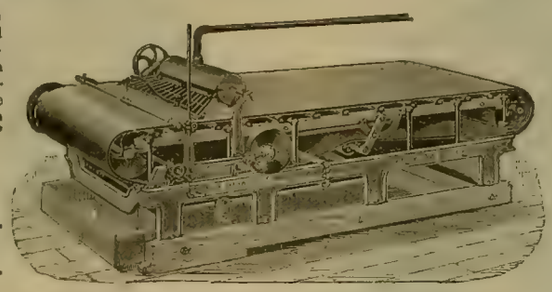
Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.



"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

HEINE PATENT SAFETY BOILER
—AND—
Macbeth Steel Pulley.
Steel Horse Whim.

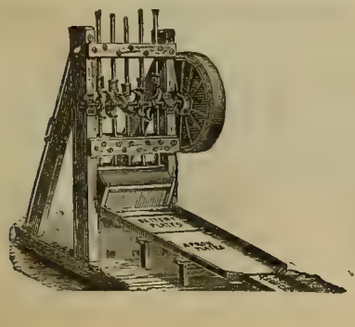
Steam Users, Attention!

The engraving represents our standard Boilers. These boilers are made of STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are bought which have a small hand-hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

STEEL BOILERS IN TWO PLATES.



SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 1 Steam Drum, 1 Breeching, 1 Smokestack, 300 Feet Galvanized Strand for Guys, 1 C. I. Front Complete, 1 Foundation Plate for Front, 1 Set Grate Bars for Coal or Wood, 1 Back Bar Bearer, 1 Ash Cleaning Door and Frame, 1 Back Arch Plate, 1 Set Binder Braces and Bolts for Brickwork, 1 Stand for Back End of Boiler, 1 Steam Gauge for Syphon, 1 Glass Water Gauge Complete with Column and 3 Gauge Cocks, 1 Safty Valve, 1 Feed Valve, 1 Blow-off Valve, 1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds.

Boilers of the following Sizes in Two Sheets kept Constantly on Hand ready for Shipment: 60 Inches Diameter x 16 Feet Long; 54 Inches Diameter x 16 Feet Long; 48 Inches Diameter x 16 Feet Long; 42 Inches Diameter x 16 Feet Long.

IMPORTANT TO GOLD MINERS!

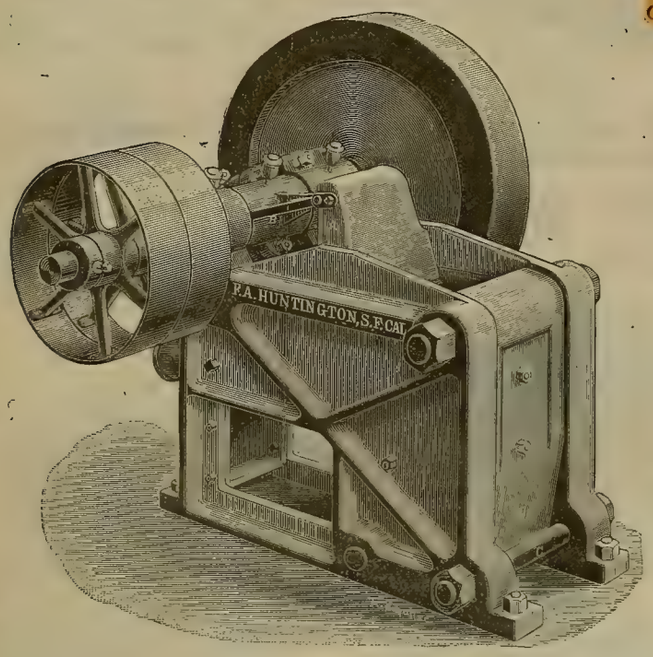
SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of **JOHN TAYLOR & CO., Corner First and Mission Sts.**

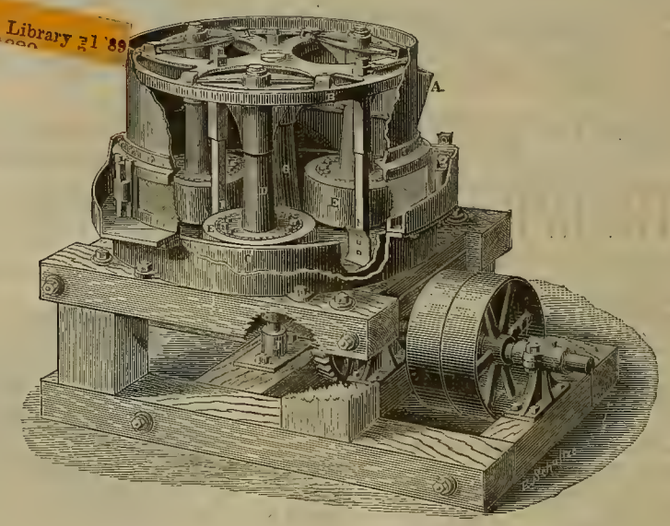


San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN



MINING MACHINERY.

Huntington's Improved Rock-Breaker.

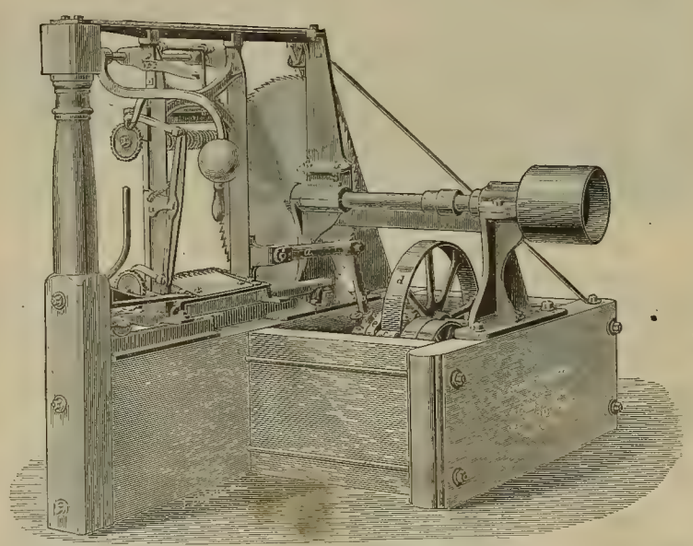
The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.



The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S
PATENT SHINGLE MACHINE.

This Machine is so well and favorably known by all the principal Lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. This feed-works is positive and uniform in its action and obviates all the jar or tremor formerly given to the machine by the weight used in the old style feed.

For simplicity, durability and rapidity of action, these machines have no equal, cutting from 50,000 to 75,500 shingles per day.

Price, complete with Jointer and one 38-inch Saw, $475.00.

The new feed-works can be applied to any of the old machines.

Price $100.

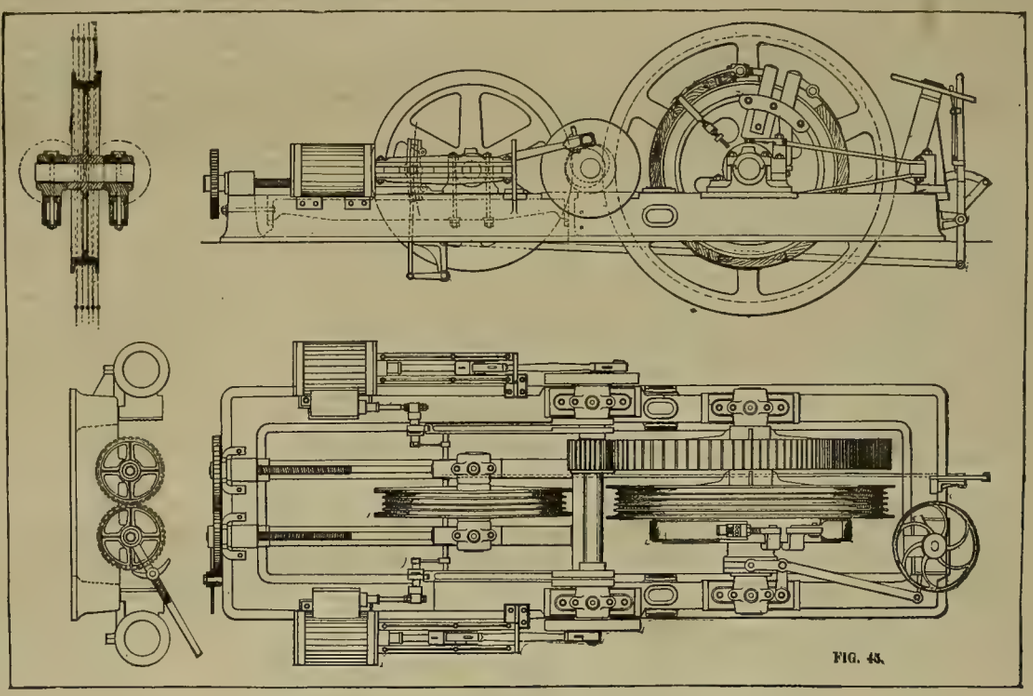
An Endless-Rope Hauling Engine.

On this page is presented an engraving which shows one of the most approved endless-rope hauling engines for mining purposes. It will be seen that there are here two drums placed tandem. The rope is first passed over the larger and then over the smaller drum, as many times as may be found requisite to secure the necessary tractive force. The motion of the larger or hauling drum is controlled by a friction-clutch. The motive-power is furnished by two engines, actuating a pinion meshing with a spur-wheel keyed to the drum-shaft. The "idle" drum rests on sliding bearings, and slack rope may be taken up by draw-bolts, as shown.

In the endless-rope system we have to consider the amount of artificial tension introduced to prevent the slipping of the rope upon the drums. The tension depends, of course, upon the number of times the rope is passed over the hauling drum. In the case of the machine illustrated, where the rope has four half-wrappings around the drum, it is necessary to allow 20 per cent more stress in the rope than in the case of the counter or tail rope system.

Much surface wear is encountered in this application of wire rope; and for this reason it is advisable in all cases to employ the best steel-wire rope, composed of six strands of seven wires each laid about a hempen center.



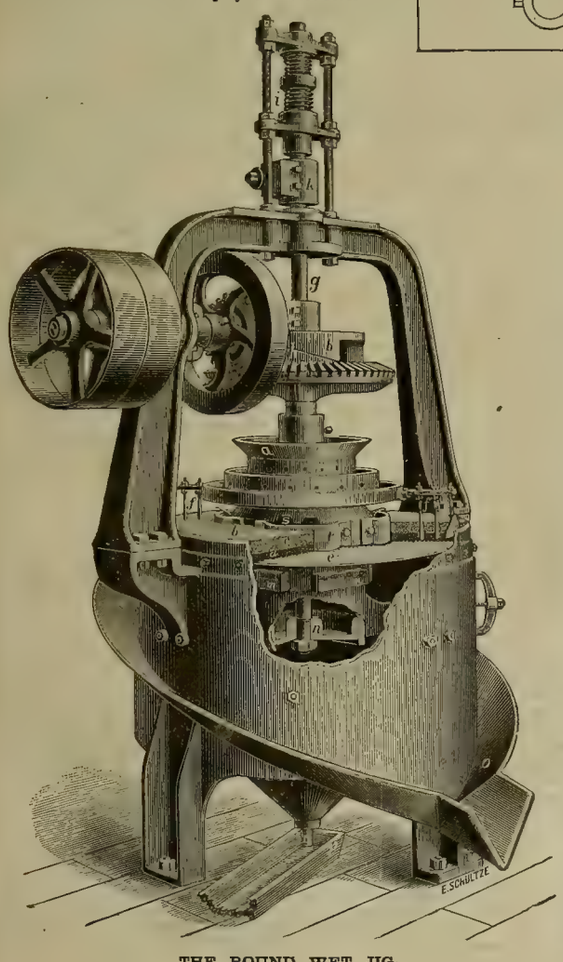


FIG. 43.

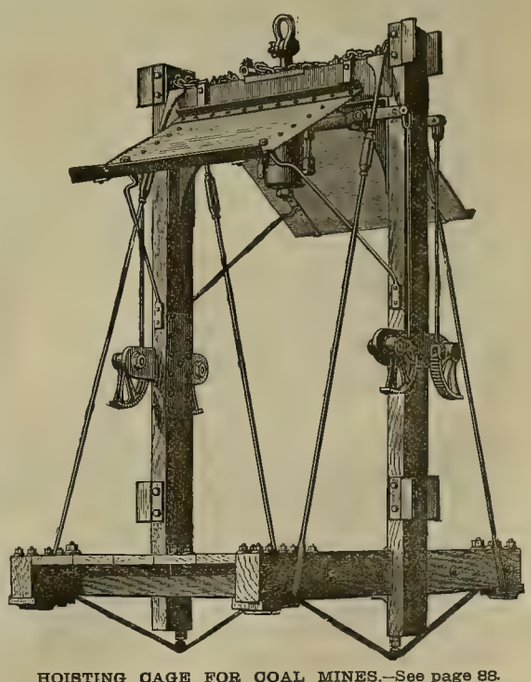
ENDLESS-ROPE HAULING ENGINE FOR MINING PURPOSES.

THE ROUND WET JIG.



The Round Wet Jig.

It is claimed that many faults and difficulties met with in the square or rectangular-shaped jigs, such as are generally used, are to be traced directly to their form. The packing and consequent bad working of the ore in the corners is not only overcome in the round jig, but increased capacity, better work and less floor room are rendered possible. The feed and plunger being in the center of the machine, the ore going from the inner circle to the outer circle, or the discharge, gives the mineral and gangue easy conditions to separate.

The crushed ore and water are carried by a trough to the machine and into the revolving ring *a*, which distributes the ore on to the concentrating bed or screen *e*, which is a little coarser than the screen that the ore was crushed through. On this screen is put a bed of mineral a little coarser than the screen. This is for the purpose of letting all the crushed mineral pass through the concentrating bed and at the same time to prevent any gangue going through the concentrating bed. Motion is imparted to the revolving cams *h* by means of revolving gear and pinion, thus gently lifting the shaft *g* and plunger *n*.

The drop of the shaft and plunger after being raised to full hight by the cams is quickened by means of springs *i*, the tappet *k* regulating the stroke. The strokes of the plunger give upward impulses to the water, forcing it through the screen *e*, lifting the ore and allowing the mineral *d* to settle and pass through the concentrating bed and screen *e*, and pass out of the conical shaped bottom through a suitable hole in a wooden plug. The tailings or gangue *c* are taken and lifted off from the machine by the rotating shaped plow-like lifters on the ends of stirrers *ff* into the tailing trough *o*. The Parke & Lacy Co., 21 and 23 Fremont street, this city, are agents for these machines.

COL. BRIDGES of the U. S. Survey is credited with saying that by storing the water of the Carson river in flood-times, not only ranches but the mills along its course will have more water than they can use throughout the entire year.

HOISTING CAGE FOR COAL MINES.—See page 88.

Alchemy.

[Written for the PRESS by HENRY G. HANKS.]

COPYRIGHT 1889.

Mercury plays so important a role in the history of alchemy that these papers would be incomplete without at least a brief notice of the doings of those most remarkable men, the influence of whose discoveries on the present advanced state of civilization cannot be denied; for the random investigations and experimental researches of the alchemists laid the foundation of chemistry, and the intelligent reader will admit that our present state of advancement would be impossible without a knowledge of that noble science and its application directly to many of our essential arts, and indirectly to nearly all others. Not only were some of our most useful chemical operations and apparatus invented by the alchemists, but the foundation also of our theories was laid by them.

History of Alchemy.

The ideas which led to alchemy are older than generally supposed. Thales (640 B. C.) believed that water was the foundation principle of all things. Anaximander (610 B. C.) a disciple of Thales, taught that air was the creative principle. Xenophanes (600 B. C.) believed in one universal principle only, and declared "God is the one." Hippocrates (460 B. C.) first advanced the theory that there were four elements—fire, air, earth and water, which produced four cardinal humors in the human body—blood, phlegm, bile and black bile.

Alchemy must, like all things, have been the result of evolution; it had made some progress at the date of Diocletian in the third century, for that Emperor, after conquering the Egyptians in the year 296, ordered the destruction of all books giving instructions in the art of transmutation of metals, "lest the people so gaining gold, should again rebel."

Hermes Trismegistus is thought to have been the earliest alchemist who left writings. The exact date is not known.

When from 406 to 640, barbarian hordes swept from the north and checked civilization, the arts and sciences were paralyzed and driven to Arabia and elsewhere, where they continued to flourish.

Many of our chemical words are Arabian, as Alcohol, Alchemy, Alkali, Alembic, Elixir, etc.

In the Middle Ages, alchemy gained a strong foothold. The following were noted alchemists: Geber, eighth century; Raymond Lully, 1235–1315; Albertus Magnus, 1193–1280; Bacon, 1561–1626; Paracelsus, 1493–1541; Basil Valentin, born 1410; Van Helmont, 1577–1644; Glauber, 1604–1668; Homberg, 1652–1715.

The astrologers preceded the alchemists, who retained their names and applied them to the elements and such chemical combinations as they were familiar with; for which reason the alchemistic names of the metals were as follows:

Gold	Sun.
Silver	Moon.
Copper	Venus.
Iron	Mars.
Lead	Saturn.
Tin	Jupiter.
Quicksilver	Mercury.

While the main object of the alchemists was to make gold by transmutation from inferior metals, the love of experimental research took possession of them, and held them regardless of their will by a sort of fascination so well understood by modern chemists. There was another incentive to the pursuit of alchemy; those who termed themselves "adepts" assumed and were accorded a measure of superiority by those ignorant of their arts, while they were held in esteem and credited with great learning.

A similar condition of things may now be observed among the American Indians, who have soothsayers, magicians, and medicine-men, as did the ancient Greeks and Egyptians.

Alchemy was called by several names: "The sacred art," "The black art," "Great work," "Pyrotechnian art," etc.; and those engaged in scientific pursuits, then as now, were by a common interest joined in an unorganized brotherhood.

No disappointment discouraged the alchemists, and the search for gold, like stock-gambling in modern times, became a mania. They conducted their operations with great secrecy, and expressed themselves in mysterious and allegorical language. This seems to have been for several reasons; the conflict between religion and science had already begun, and they were actually in danger of being accused, apprehended, and even burned at the stake. It was a pleasure, too, to receive the adulation, or something akin to it, from the masses. The latter motive lives in modern times, and causes the physicians of to-day to write prescriptions in Latin, and to express by symbols the commonest substances.

Some honestly believed in these ideas and pursued them with great diligence and persistence to the sacrifice of all else; while others, pretenders or knaves, lived on the credulity of the ignorant, who advanced means to carry on their experiments, very much as country store-keepers in California supply "grub stakes" to a certain class of prospectors who seek a lost mine, or invent a secret process to work rebellious ores.

The writings of the alchemists which still exist are so enigmatical and obscure as to be almost worthless, but are supposed to have been understood by the adepts. The following is an example written to instruct the reader in the art of making gold by transmutation, with the supposed meaning:

"Catch the flying bird" (mercury) "and drown it so it can fly no more" (form an amalgam with gold); "quench it in the philosopher's well" (aqua regia), "by which its soul will be dissipated and its substance united to the Red Eagle" (ter-chloride of gold), etc. But by following the most detailed directions left us, no expected or promised result can be obtained.

Geber claimed to be able to change mercury into gold "without the help of anything more than its multiplication." In the occult language of that period he writes: "Bring me the six lepers that I may cleanse them," meaning the other metals then known—lead, tin, copper, iron, silver and gold. His descriptions were so obscure and unintelligible that the word "geberish" was coined and applied to his and the writings of other alchemists.

Artephanes (12th century) was said to have lived to the age of 1025 years through the potency of his medicinal preparations.

Gases, essences and distillates were first called "souls," then "spirits," which name is still retained and applied to alcohol, spirits of niter, turpentine, etc.; and much of the apparatus of the modern laboratory is either identical with or modeled after that of the alchemists.

Theories and Causes that Led to Alchemy.

The alchemists sought a universal ferment, a solvent, also universal, known as "alcahest," and a fountain of life, as well as the art of transmutation. These ideas began to concrete about the time of Hermes, and continued through the fourteenth, fifteenth and sixteenth centuries.

Until the end of the seventeenth it was generally held that all metals were compounds, and that any one, including gold, could be produced at pleasure, if the secret could only be obtained from those who it was thought had discovered it. Instances were related of certain impecunious alchemists who had suddenly acquired great wealth. The general gist of this very natural belief was as follows: They assumed that there was a solid substance of a red color and great weight which could be artificially prepared, and if introduced in small quantities into a red-hot crucible, with a base or imperfect metal in a state of fusion, observing certain mystical precautions known only to the adepts, they would be changed into gold, which could be cast into an ingot in the usual manner. This substance was the Philosophers' stone, called also by other names. There was, too, a supposititious fluid, also of a red color, a few drops of which, if poured on quicksilver, silver, lead or other base metal in a state of fusion, would change it to pure gold. This, called also an elixir, if used as a medicine, not only cured all diseases, "unless the principal parts had perished or the predestined time for death had come," but renewed youth and arrested old age. In this form it was called the "Panacea." There was also a stone and an elixir, but white in color, which changed base metals to silver.

Metals were considered living individuals, and the gases sometimes generated in their decomposition, as their departing souls. The known metals were regarded as being perfect and imperfect; the latter were supposed to be unfinished by nature. And it was thought that if the missing element or constituent could be known, and added, a perfect metal, gold or silver, would result.

The fluid condition of mercury, its great specific gravity and other properties, early attracted attention, and its study by the alchemists led to the discovery of the amalgams and to the attempts to produce gold by its aid. While, like the ancients, they were still doubtful as to its character, the adepts placed it among the metals, of which it was the seventh, all then known to them.

Raymond Lully wrote as follows: "Bodies dissolved in mercury are not decomposed. Their nature remains hidden in the mercury until they fill up its intervals. Mercury contains interstices, and therefore metals can be hidden in mercury."

Geber believed that all metals then known were composed of mercury, sulphur and arsenic, and was first to advance this theory.

Becher, a German chemist, born 1630, claimed the existence of a mercurial earth, and considered the metal to be a compound of this with two other distinct substances or principles, one vitrifiable and the other combustible.

One of the earliest chemical experiments was to cupel lead from argentiferous galena. A portion of silver remaining, it was inferred that the lead had changed to silver. Cupellation was discovered by Geber.

Copper ores were dissolved in acid, yielding a colored solution, from which immersed plates of iron precipitated metallic copper, leaving the solution colorless, and it was believed, very naturally, that the iron had changed to copper. These and similar reactions served to verify theories and encourage search for the Philosophers' stone.

The following quotations from the works of various comparatively modern writers will convey to the reader some idea of the general opinions of the times.

The writer has a much-prized volume entitled "Discovery of Subterranean Treasure," by Gabrial Plattes, 1639, who is said to have died of starvation in the streets of London. On Folio 40 he carefully describes, in quaint words, how he obtained pure gold from other metals. The following is briefly the operation:

His ingredients were eight ounces of regulus of iron and copper, 16 ounces common sublimate bought at the apothecaries'; they were reduced to a powder separately and then ground well together on a marble slab. He put them into a glass retort and submitted them to distillation, first obtaining an oily substance like butter, and lastly a yellow sublimate tinctured with iron and copper. This he redistilled three or four times until very pure, then mixed with equal parts of amalgam of quicksilver and silver, which was put into a second retort of glass. All the mercury came over, leaving the silver like yellow horn. This silver he amalgamated again with new quicksilver and set it in a gentle heat for a week, then a very strong heat for six hours, "so that the quicksilver rose up and fel downe again upon the silver till such time as that it had carried up all the silver from the bottome of the glasse into branches like trees; then I melted downe the silver and fined it and parted it with aqua fortis and had divers grains of pure and good gold abiding all tryalls, but the quantity would not pay for halfe the charges and labor."

He then describes his method of making the regulus referred to above. He took four ounces of stub nails and made them red-hot in a crucible, then put in eight ounces of crude antimony and melted them together; when cool, he broke off the regulus, made a similar preparation of antimony and copper, mixed equal quantities of each and melted them together three or four times, to every casting adding half an ounce of saltpeter. The result was a white metal like silver, but brittle. It could be pulverized in a mortar.

The silver, "like yellow horn," amalgamated with difficulty, only by grinding with addition of salt and vinegar. The original silver was "water allver," which he bought from the refiners, from which they had taken all the gold. This amalgamated easily. The amalgam was strained through a skin of leather and then mixed with the yellow sublimate. The proportion of the quicksilver to the silver was five or six parts to one. His concluding remarks are so curious that they are quoted in his own words: "If any one doubts the truth of *alchemy*, he may be satisfied by this tryall; but instead of gaine he shall pay for his learning by going away with losse. I do not deny that there are workes of lesse losse and charge, yet but none of them lucrous by reason of the change of times.

"For if any one will uphold me as good a lease or purchase of land as I can prove by credible records hath bin in former times for an ounce of gold, I will undertake to make an ounce of gold by art to pay for it, and yet have a good bargaine.

"But the difference of times hath confounded this art, as may appear more plainly beneath.

"First, in ancient times a man's work was not worth a penny a day, which is now worth two shillings and six pence a day, as may appeare by ancient records for buildings and the like; so that there is thirty to one losse in the workmanship.

"Secondly, then coales, vessals & other things necessary for these affaires did cost but little, in respect to the charge now.

"Thirdly, when gold was made, it would have bought thirty or fourty times as much, either lands, leases, victuals or workmanship, as now.

"So that I conclude that then the owners of this Art might gaine 30 or 40 to one, and yet now they shall lose extremely.

"The cause that moved me to search so much into these affaires was because I saw by the bookes that divers men in divers ages and in divers Countries did agree in one tale; whereby I conceived it unpossible to be a lye; now I conceive it might be true, but that the times have made an alteration."

This account reads like the writing of an honest man, but his methods being crude, it is likely the materials used by him were so also, and the small quantity of gold obtained lay hidden in some of them by him unknown and unsuspected.

The following, a translation from the "Journal of the Voyages of Monsieur de Monconys," 1645, is an illustration of the vague manner of wording so-called instruction for the transmutation of metals.

Volume I, Folio 34. "Meditations for the Natural Production of Metals and the Artificial Method of the Philosophers' Stone."

"Nature sends constantly from the center of the earth a warm and humid vapor which is the cause and principle of all life and of mineral and vegetable productions. When joined to earthy and material particles, it makes a substance which unites with and forms a part of all mixtures, which differ only in their composition, but are animated by a single spirit, *Mercury*, of which all metals are formed. When this vapor passes across an earthy substance, dry, penetrating and sulphurous, it is easily attracted and joins itself to it, because everything dry desires to be moistened; and as this vapor or mercury is forced by the central heat of the arch which constantly eludes it, it passes over, charged each time with some small portion of this earth, until it meets the vaults of mountain caverns, whence it falls back on the earth it had moistened in passing. Here it is reheated and again forced by the heat to a higher point from below, more fully charged from the earth than before, which obliges it to fall frequently after many sublimations and precipitations.

"At last all this mercury is absorbed by the dryness of this earth, and by the internal heat it is formed into a compound which we call *Metal*, the material of which, as well as the essential form, is the same in all, differing only accidentally by lightness and color. The first difference is weight, imperfect metals being much lighter than perfect ones. The cause of this is that in their composition are mingled larger and more heterogeneous particles which hinder the perfect union which is found in mixtures of subtile and homogeneous parts; for it is evident that as there is more space in a pile of apples than there would be in one of millet of the same volume, and as 1000 cubes would arrange themselves better and would unite more perfectly than 500 cubes, 300 spheres and 200 cylinders, so the larger and heterogeneous parts mingling in the composition of metals prevent the perfect union of the subtile and homogeneous ones, and cause an infinity of space, from which proceeds their lightness and the ready entrance of external agents which easily destroy them.

"The second difference is the color; for if all metals were equally heavy and yellow as gold, they would *be* gold likewise.

"The same cause which has rendered them light has prevented them also from being yellow, and the aqueous humidity which still dwells in their composition and which the heat of the earth only evaporated a little, not dried entirely, contributes more to it, because it is not only distributed between the subtile and essential parts of the metal as are the large dry particles which disturb the order and arrangement of it, but it covers the surface of the homogeneous parts and thus prevents the reflection of the light from coming to our eyes with the same strength that it would, had it been modified by the dry and metallic surfaces; and since the Philosophers have said that the action of heat on dampness produces black, and upon dryness white, we are able to conclude that where there is perfect dryness it causes yellow. We may remark this in bread, which, being only a mixture of flour and water, that is to say, of dryness and moisture, takes nevertheless various colors, in proportion as the fire has dried it more, and disarranges or orders differently the small parts, and consequently disposes their surface in another manner.

"If it is in this fashion that Nature makes metals and our desire is to make them also, we must imitate her. We must take, like her, that dry earth, subtile and sulphurous, and the mercury or hot and damp vapor; then inclosing them together, sublime and circulate them until they fix themselves into a metallic substance which by long baking will finally become gold, and the more easily, and the more often, because we can beforehand purify this earth, and employ a much greater and more steady heat than the central arch.

"But the wish of the Philosopher is to make a powder, fusible, subtile, penetrating and colored, in order that by its susceptibility it can melt at the least heat, by its subtility it can insinuate itself into the tiny pores of the metal, and by its penetration it can enter and mingle perfectly in all parts even to the center in order to join itself to them and make them unite perfectly by fixation. After having driven away the heterogeneous parts which prevented it from doing this, by its own exuberant color, which is a dryness greater than gold, it finally dries the imperfect metal and stains it a perfect color. If there is any substance suitable to make this powder, it should be to my thinking that earth dry, subtile and sulphurous, which Nature has furnished for the production of metals, because it has already many of the qualities necessary to this powder, principally fixation or dryness. For if when it was yet all crude, humid and feebly aided by the heat of the arch, it had the power to fix the subtile and fugitive, hot and damp vapor, or the mercury of the Philosophers; then when art has given it its perfection and the qualities we demand, it will not only fix the same crude vapor which it did before, but this vapor condensed and cooked into a metal, although imperfect, as we can see in the example of flour, which, having the power to absorb water and thicken into a tender and soft paste, will easily harden and dry if we add to it anew from below. But if instead of this crude flour we throw on this paste some pulverized biscuit, the dryness will without doubt be much greater and more quickly attained.

"It is necessary to look for the ways and places where we can find this earth. Since it is hidden by Nature, it is only with difficulty that we can obtain what she gives us roasted and mostly prepared, and without any mingling of heterogeneous impurity, as in gold, which, using the comparison above, is like a very dry biscuit, which can, without any help of art, dry other pastes a little more than they now are, but not as much as itself, unless it subtilizes them so much that it can mix itself with them *per minima*, according to the terms of the schools. But it is in this that the chief science consists—in knowing how to perfectly subtilize the salt—and I imagine it can be done only by breaking and dissolving it, and that as it coagulates only by the junction of mercury with all its material parts, which it holds joined one to the other by its viscous and glutinous quality; it can only loosen them by separating skillfully this humor by means of its like, in which, having thrown gold, it dissolves immediately, because it has the power by its subtility to enter into the pores of this metal, where, being introduced, its like joins itself to it, as snow to water in which it melts, and leaving the ma-

terial part of the mixture which it held, it diffuses itself perfectly and radically.

"Before explaining the manner of drawing out this earth and preparing it for the use we desire, it is necessary to find out where to get this mercury, this natural dissolvent which is found in all the mixtures of nature as the most essential part of their composition. Nature draws out and dissolves them only by the ministry of crude and indeterminate mercury which is diffused in air, water and earth, which, penetrating the seeds it meets with, corrupts them and joins itself to the mercury they inclose, which is specified and had the character of the individual it made, which it impresses on this mercury, which has none, leaving it no inclination to the particular formation of any mixture save that to which the matter and the matrix which it meets forces it.

"But afterward, when the specified mercury it has disengaged from the mixtures impresses its character on it, it disposes or effects in like way all the matters which it meets. It arranges them according to the inclination it has received from the other mercury, and this is, to my thinking, the most likely fashion we can imagine of the multiplication of species and individuals.

"Following, then, this reasoning, if in order to disengage the mercury from the gold it is necessary to make use of that which we have first drawn from some other mixture, we must have plenty of gold beforehand in order to draw out this mercury, and thus we are convinced of the necessity of having it all pure, natural and free and for the most part indeterminate, because, as I have said, the mercury extracted from the mixtures being specified, impresses its character on the mercury it meets which has none, and also upon that which has, but which is less than it in quantity and more feeble, consequently unable to resist the powerful movement of the other; and supposing that they can extract without the aid of any other mercury that of some mixture which finds itself feebly held, as by example in some vegetable, the quantity which would be necessary of it in order to extract that from gold being infinitely greater than that we should draw *from* the gold, there is more reason that it should impress the vegetable character on the solitary mercury than receive from it the metallic inclination which is necessary for the physical powder. By this we may conclude the second time that it is only necessary to extract from any mixture, by disengaging itself, some small particle of corporeal and terrestrial matter which shall alter its natural subtilty necessary to introduce it into the pores of the gold which it is to dissolve.

"To which reason we may add a fourth—that there is a very little mercury in every mixture, and it being necessary to have a good quantity of it to dissolve the gold, in order to have a sufficiency of it, there must be labor, time, and an extraordinary expense in dissolving a great number of mixtures. We may then conclude that it is necessary to take this mercury or dissolvent from magnesia, where Nature has inclosed it very lightly, so that drawing it from thence without difficulty, we may receive it pure, indeterminate and in such quantity as we may desire after having excited a little its dissolving property and prepared it according to art, by some decoctions in which the first operation consists of magistry. Having placed it in a state of perfect dissolution, we may make it destroy the body—that is to say, we place the gold within, in order to be dissolved there, imitating in this last operation the proceeding which we have told in the commencement; how Nature holds it in the formation of metals, and this we must find out and apply in order that the Philosophers may imitate nature. This cannot be wholly verified, since Nature only *makes* metals, which the artisan makes no pretense to, having only designed to make a powder or a medicine for imperfect metals, which Nature has never undertaken to do. Nevertheless, it is necessary to imitate in the making of the powder the method she has taken in making the metals. We must then inclose our mercury in a perfectly tight vessel with calcined gold as Nature shuts it up in the mountain caverns with metallic earth; and by the continued heat of artificial fires, which imitate the arch, this spirit is sublimed and falls frequently upon the earth, which at last corporizes and fixes itself with it, and this much quicker than it could have done in the inclosure of the mountains, from the greater and more continued heat employed, which is not altered by the diversity of the season or the accident of a number of exhalations which cross these places. From which cause the earth used by the artist is much more dry than when Nature employs it, and has acquired the degree of metallic decoction *par dessu*, which has given it more force to dry this mercury and the hot and damp vapor.

"Finally, in the philosophic operation, the earth having much more disposition to fix than it had in the first operation of Nature, it is necessary that it should subtilize and divide itself into as many parts as there are spiritual parts to fix, and the spiritual parts being in less quantity than the corporeal which they unite and simply color, are easily absorbed and dried by them; but in the making of the powder it is necessary that a little of the corporeal molecules should be divided into as many parts as there are spiritual atoms subtile and indivisible, with each one of which it is necessary to mix some dry and corporeal atoms in order to fix and keep them, so that repeating many times these dissolutions and coagulations of the same corporeal parts, with the addition each time of a new quantity of the spiritual, the corporeal subtilize and divide themselves so finely that one cannot tell if they are spiritualized or the spirituals are corporealized, and by this philosophic operation this admirable powder is perfected and completed, and it has acquired the necessary qualities for projection.

"For it is fusible on account of the warm and damp vapors of which it is composed, it is subtile from the division of the corporeal parts into as great a number as there are spiritual, which then, not being weighed down nor arrested by any corporeal matter at the least heat which excites them, enter easily into the most ferruginous metals when these are ever so little opened by heat, and join themselves to all their parts, and having driven away what was impure and heterogeneous, they unite perfectly one with another.

"Then it fixes them by its great dryness, which has been increased in it by various decoctions of art, and this dryness raises it to a supreme and lively color infinitely beyond that of gold which it communicates to the metal, which is lacking in it, and leaving it fixed and highly colored, corrects its imperfections and makes of it a perfect metal."

Dr. Helvetius gives an account of transmutation in Hague in 1666: "Here, by the smallest portion of the Philosophers' stone, a great piece of common lead was totally transmuted into the purest transplendent gold." He gives a detailed account of the occurrence, which the reader of this may find quoted in the first volume of Brande's Chemistry, Third Edition; London.

Quotations from "Pyritologia; or, a History of the Pyrites," by J. F. Henckel, about 1740:

Folio 47, Foot note: "Dr. Meuder, in his analysis of antimony, seems to allow of no arsenic in the regulus of antimony. Our author speaks according to the common opinion, viz., that the regulus of antimony is a mercury fixed by arsenical vapor."

Folio 201: "* * * This, however, I must here say for arsenic (not out of any alchemical views, but only in regard to its universal treatment in ore-smelting and the like, and from some experience I have had of it), that it wants not a great deal to become silver."

Folio 217: "* * * I would not here be understood as depreciating the following propositions: 1. That a perfect, or, if you rather choose it, a ripe metal may be made from an imperfect metal. 2. That some pyritæ are not without some small share of gold, the first experience of every one may confirm in the least conversant in the business of minerals and metals with any care and attention, though the thing cannot be reduced to any certain theory or rule to be depended on at all times. But in all these proofs, where, for instance, copper and iron particles are transmuted or converted to gold, as also some particles of lead, tin, regulus, etc., to silver, it may by no means follow that iron and copper are an immature gold; or lead, tin or regulus, an immature silver.

"Metals are undoubtedly near allied to each other, though why so in the ascending and not in the collateral line? and philosophers borrowing the term *maturation* from the vegetable kingdom, it is only in the way of comparison, and serves merely as a demonstration but does not amount to an illustration; either it is out of a certain deference to the *great work* they forbear the use of the term *transmutation*, or to avoid falling by the ears with the Aristotleians, who, from their doctrine of genus and species, disclaim all transmutation of metals."

Folio 239: "* * * Gold and silver can never be called formal till they have attained their metallic form, and once thus, they become mature, or, as we speak, '*grown;*' but the metal is to be considered in the ore no other than an earth, which either the sulphur, the arsenic, or both together have penetrated, dissolved and drank up; or which appears barely in the form of an earth or stone without any observable sulphur or arsenic. * * * I must needs abide by Geoffroy's conjecture in opposition to M. Lemery; namely, that for a metallification of a metallic earth, something, namely, a fatty inflammable matter, must be incorporated therewith."

Folio 242: "* * * and should more than two different parts of pyrites, nay, any other foreign matters employed, contribute to the ground mixtion of such *gold earth*, we must rather adopt the terms *introduction, production, transmutation*, etc., and drop that of separation"

"Alchemistic Experiments by Homberg," quoted by Henckel from Mem. de la Acad., etc., l'An 1709, folio 141–142: "Take between one and two *marks* of silver, which, being assayed in the usual manner with aqua fortis in order to ascertain its containing no gold, melt an hundred times over, and having continued it each time in flux for an hour at least, *deport* it. You will procure a very sensible quantity of gold which before was not to be found in the silver.

"Take and dissolve a *mark* of silver in aqua fortis and remove what remains undissolved in the bottom of the glass; throw down this solution with common salt, edulcorate well and precipitate and dry it; to this silver calx take half as much regulus of antimony well purified and reduced to a fine powder, mix all well together, and being put into a retort, drive it in a sand heat and there will come over about three ounces or more of butter of antimony; raise your fire to the highest pitch, and you have the silver in the bottom of the retort mixed with part of the regulus of antimony; put this silver in a crucible in an open [illegible] fire, where let it fume till it can no [illegible]r till the r[illegible] ulus be entirely gone off; [illegible] the silver on more, nay twice, with a little borax and saltpeter, and it will prove as fine and ductile as tested silver; then granulate and dissolve it in aqua fortis and you will have a number of small black specks which being melted prove genuine gold. Repeat this with the same silver a second and a third time, and you will always procure some black gold calx.

"In the first process, the particles which are proximately fitted to become *gold* begin to be perfect, and fall down as small flocks; in the second there are some more prepared and perfected, and in the third none at all; when it appears that the particles fitted to be gold are by the two first operations quite exhausted or grained out of the silver.

"Here it may be objected that the regulus of antimony (regule de Mars) has produced or educed this black calx from itself; if so, there must as much be produced in the second and third operations as in the first; whereas in the second there is not so much as in the first, and in the third none at all. To this add, that we very often meet with grown native *gold* in the earth much paler than a fine sort should be, yet without yielding the least silver, and which by a repeated smelting begins to become perfect, and to attain its due color. Thus we find in silver a matter which turns to gold, and in *gold* a pale (blanchatre) matter which by the fire gains the genuine *gold* color. These are the two matters, which are a middle metal between gold and silver, but which remain not long in this state, being by each smelting brought still more and more to the perfection of gold."

From "Collection of Fifteen Hundred Chemical Processes," by Johann Joachin Bechers, Med. Doct., Halle, 1726:

Folio 345: "Take eight loth clean mercurial sublimate in a new crucible, and two loth fixed sulphur powdered; spray over and set it in a gentle fire. When the mercury is hot, so melt the sulphur like wax, and do not let the mercury sublime. When the mercury is heated, it will jump, for which reason set the crucible so that it will not fall. When they flow together, take first a piece of antimony as large as a bean and drop it in. Do this three or four times, so refresh the mercury and cool the sulphur. The mercury will commence to look like fine silver. Dissolve in aqua fortis and you will find in two marks of silver four loths of gold."

Abbe Raynal, 1770, thus records the theories prevalent in his day:

"The origin of metals has not always been well understood; it was long thought that they were as old as the Creation. It is now believed with greater reason that they are formed successively; in fact it is impossible to doubt that Nature is continually in action and that she exerts herself with as much power in the bowels of the earth as in the regions of the sky.

"According to the conjectures of the naturalists, from large caverns which are perpetually heated, there arise continual exhalations; these sulphurous and saline liquors act on the metallic particles, attenuate them and divide them, and put them in motion. Within the cavities of the earth they again unite, and becoming too heavy to support themselves, they fall one upon another. If in their several motions they have not met with other bodies, they form pure metals, which they do not if they happen to be combined with other substances."

Modern Alchemy.

More recent chemists have believed in transmutation. Salmon, 1692, freely expresses his belief, as did Von Helmot. Bergman, 1735, after quoting the writings of others, writes: "Although most of them are very deceptive, and many uncertain, some bear such character that unless we reject all historical evidence, we must allow them entitled to confidence."

Having no knowledge of modern science, the earlier chemists did not realize that while combinations and changes were taking place as they observed them, metals were merely being transferred from one locality or position to another, sometimes mineralized, sometimes free, but believed that they were actually created or produced by the reaction of the elements, vapors, gases, and heated fluids. This led to the idea that Nature could be imitated and metals produced artificially.

It is not an uncommon thing at the present time to see in modern newspapers accounts of the discovery of the art of making gold from inferior metals, demonstrating that the idea is not yet obsolete. A late number of the Philadelphia *Times* published an article on this subject, stating that a man in that city, whose name was given, began the study of alchemy, gathered a large library of occult books in one of which he found directions which enabled him to make an ingot of metal *which he believed to be gold*, derived wholly from base metals.

It is a reflection on the intelligence of the present age that this idea has been reasserted and has found believers. It is singular that educated men can be found in the 19th century willing to invest their money upon such representations. It has been boldly asserted that certain rocks and mineral waters found near San Francisco contained all the elements of gold except one, known only to a few persons, and it was only necessary to supply the missing one to make gold, which could then be extracted by the usual methods. Money has also been expended in San Francisco to verify the assertion that by a secret process a certain amount of gold in the form of the soluble terchloride being added to an earth, by singular good fortune lying conveniently near the city and containing the imperfect metal, the gold could be recovered augmented by that in the rock, perfected by the art of the modern alchemist.

It is also a well-known fact that there are men in the United States who make a business of discovering mines and water by the use of the divining-rod.

Tuolumne Mines.

EDITORS PRESS:—The following group of mines on the mother lode of California are situated at Jacksonville, on the Tuolumne river, and are worthy of interest to the mining men of this State. A short report will perhaps bring them into notice, and benefit some one now or at some future time. They are named the Tuolumne, Stanley and Gladstone; area of group, 58 acres. They consist of large bodies of quartz of low grade, and can be worked at almost a nominal expense, for no shafts, tunnels, hoisting works or pumps are required, and will not be for very many years. They can be worked on the open quarry system. The rock is valued by its owner, Thos. Whitto, an experienced Cornish miner, at from $5 to $8 per ton, although rich deposits in kidney forms are found of many thousands of dollars in value. The owner has taken out considerable money the past few years, but feels the property requires capital to work it on a cheap basis by large mill-power of say 100 or more stamps. From the proposed mill site to apex of mountain, backs can be obtained of 400 feet. Any quantity of water is available drawn from the Tuolumne river. A ditch cut one-half a mile gives 14 feet elevation, suitable for turbine wheel-power. The ditch made sufficiently large to carry the required volume of water necessary for the wood, can be constructed at a cost not to exceed $7000. A frontage to the river can be purchased from the owner, who cultivates the small strip of land adjoining the river, for a small consideration; from base of mine to river does not exceed 400 feet. This is sloping land, well adapted for a mill-site, etc.

The veins will average in the aggregate 60 feet. The base of operations should be at the Tuolumne mine, being the nearest to the river. The veins crop out at the surface, and continue exposed for nearly 900 feet. There is a good road to the mines. The nearest railroad is station Oakdale. Freight is three-fourths of a cent per pound. Work can be carried on all the year round. This group has merit and will bear investigation.

ARGUS.

Arizona Notes.

EDITORS PRESS:—Having taken a trip through the mineral belt running south of Prescott as far as the Oro Bel'a mine, I was astonished at the interest taken by the miners in the establishment of the Yavapai Development Company. The success of this enterprise will create a home market for hundreds of tons of ore which are piled up on the dumps of too low grade to admit transportation out of the Territory. As far as I can learn, the plan of that company is to establish amalgamating and concentrating works at mineral centers, purchase ores directly from the miners and convert them into a form capable of transport tion to general reduction works to be established at Prescott, the present terminus of the railroad.

This plan, properly carried out, will stimulate miners to develop their prospects, many of which will undoubtedly become valuable mines. Mr. Geo. J. Rockwell, M. E., who is traveling in the interest of the company to investigate the mineral resources of the county and the feasibility of the establishment of such works, assures me of having ascertained that even with the imperfect development of the claims, that there is sufficient ore and of a character to supply the capacity of two mills of moderate size.

There are large possibilities in the future for the growth of an enterprise of this kind. What are now prospects may become mines, which will draw outside capital into our midst; the small mills will be increased as to capacity, a railroad may take the place of wagon-roads and burro-trails, and Yavapai county become a prosperous bullion producer. Wherever enterprise, capital and mining intelligence have been brought to bear, valuable properties have been the result. I will cite, for example, the Congress, the Hilleside and the United Verde mines.

JULES BAUMANN.

A VALUABLE INVENTION.—A new shaping-tool has been invented—a machine in which two flat surfaces, acting vertically or horizontally and moving in opposite directions, with adjustable dies fixed upon them, roll in one motion a piece of metal, regular or irregular in shape, and of almost any desired pattern. At a single stroke of the mechanism may be obtained a sphere, a cone, a chair screw, a bolt with thread and head—in fact, an endless variety of mechanical forms. We have already made mention of this device in these columns. It will no doubt prove of much practical value in the machine-shop.

IT is stated that nearly 5,000,000 persons in the United States depend for their living on the sale of liquor and tobacco.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE (LIMITED).—*Ledger*, July 27: About 80 men are employed, getting the mine in shape for the 60-stamp mill, and finishing the surface work necessary to start the mill. A force of men is at work on the mill reservoir and ditch for the 18-inch pipe to the mill; another crew is laying the pipe. The old hoisting works at the south shaft have been taken down, and the new works started.

CAVE IN PLYMOUTH CONSOLIDATED.—Plymouth met with another serious misfortune this week. On Tuesday a large cave occurred in the Pacific or Plymouth Consolidated mine—the mainstay of the town. It is of such extent as to cause the stoppage of the mill, and the discharge of about 50 men—in fact nearly all the employes. We understand it was the intention, had the cave not taken place, to close the mill for a time and go to sinking. In this case, a long period of idleness is probable. The Keystone is being surveyed by surveyors from San Francisco. They have surveyed all below the 800-foot level. The forty stamps are dropping in their old way, and to all appearances the Keystone is moving up to her former gold-producing position. The South Spring Hill repaired the shaft on Monday, and placed a line of air pipes to ventilate the mine. W. A. Nevills of San Francisco came up to endeavor to adjust matters concerning the Moore mine. It is rumored that he will soon start up the Big Tunnel and Moore properties. The expected sale of the Mahoney mine at Sutter Creek to the Wildman Company has fallen through, so it is reported in Sutter Creek.

Butte.

GOLDEN GATE MINE.—Chico *Enterprise*, July 21: The building of the flume and dam on the Golden Gate mine is progressing finely. About 150 men are employed night and day, and the company expects to commence mining operations in about four weeks. The water is now backed up 30 feet at the dam, and two miles up the river the capacity of the river is about 100,000 inches, which is a vast volume of water to contend with. This company deserves great credit for this undertaking, and if all pans out well river mining on the Feather will receive its share of capital now being invested by English and American syndicates.

RICH STRIKE.—Chico *Enterprise*, July 27: J. R. Lightford came down from the hills to-day, bringing with him a bottle of fine specimens from a ledge which he has just discovered in the mountains above Inskip, at the head of Philbrook valley. The specimens will go at least $500 to the ton. A company has been formed to work the mine. The elevation of this mine is about 6000 feet.

El Dorado.

GRAVEL CLAIM.—Georgetown *Gazette*, July 23: Dave Fraser, the old-time miner, who is now drifting in a gravel claim on Cement Hill above Georgia Slide, has presented us with some curious specimens known as petrified wood, but unlike any we have seen. They are in part wood in a state of decay, but mostly composed of massy and heavy sheets of pyrites which have replaced a portion of the wood. They were taken from near the bedrock, beneath a depth of 300 feet of cement and volcanic ash. Mr. Fraser is drifting through a tunnel several hundred feet in length and meets with logs, both rotten and sound, as well as that which is mineralized, and he meets with roots and stumps in place where they had grown. Some are the mountain laurel. The material in which this wood is imbedded is a hard cement, once a soft sediment. Beneath this lies the gravel in the bed of an ancient ravine where the gold is found.

Mariposa.

POCKETS. — Mariposa *News*, July 27: Two pockets have been taken out recently in the Storey mine at the head of Missouri gulch which was found under the Malone reservoir, that supplied water to miners in early days. One was taken out last week which probably amounted to $2000; another was taken out Wednesday, which may yield $1000, but no accurate estimate can be made. Though it has the appearance of a "blanket" vein, it is very wide, probably 30 feet, and fully six feet is rich milling ore. It may develop into one of the best mines on the grant.

Nevada.

ANOTHER ELEVATOR MINE. — *Transcript*, July 23: Supt. Miller is getting ready to work by the elevator process the French Corral placer mine opposite Darneal Bros.' store. Many years ago the gravel there was worked by the aid of stamp-mills and paid large profits, and then the lead was lost, to be rediscovered subsequently. An area of it about 800 feet long and 80 feet in width remains unworked. The present plan is to hydraulic it, and the debris will be raised 45 feet through a perpendicular pipe and deposited in a pit where it will be effectually restrained from running into and polluting the waters of the South Yuba river. Heretofore, in working by the elevator process, the pipe that raises the debris has been put on an incline; but it has been recently demonstrated that there is less friction and consequently better service with a perpendicular pipe.

CROWN POINT MINE.—Grass Valley *Union*, July 27: An important development was made in the Crown Point mine on Saturday, in opening up a vein 4½ feet in width in the southeast drift on the 180-foot level 540 feet from the shaft. Drifting had been going on for a long time in that direction on a small vein following the footwall, until it was finally determined to make a crosscut, and in a distance of nine feet the large vein here spoken of was cut into. The quartz shows well in galena and sulphurets, and is considered the most important find made in the mine in several years, and gives the promise of reviving the reputation that the mine had two years ago, when some very rich rock was taken out.

PROFITABLE POCKET MINING.—*Transcript*, July 27: D. W. Lord, who recently celebrated his seventieth birthday, and his partner, Mr. Curry, have recently had good success pocket-mining on Red Hill, two miles west of this city. Week before last they cleaned up $402.50, and last week did still better. In one day they realized $160 as a reward for their labor. Red Hill has long been famous as a pocket-mining region. Thousands of dollars have been found there by various prospectors, some of whom have got big returns. There is probably more gold left in the hill than was ever taken out.

COE MINE.—Grass Valley *Union*, July 25: The water in the Coe mine has been lowered to the 400-foot level, and the drifts repaired, and everything is ready awaiting the visit of Mr. Craig, the lessee of the property, who is looked for daily to make arrangements for the starting of regular underground work.

Placer.

PICK AND SHOVEL.—*Herald*, July 27: Good ore has been struck in the Pioneer mine. W. H. Bellows and J. Rathborn of Dutch Flat have bought the Lost Camp mine, near Blue canyon, and are preparing to drift. Parties are putting up a quartz-mill on the old Red Stone ledge above Blue canyon At the Hogsback they have sunk over 250 feet, and drifted across the channel. They have ascertained from sinking that the new tunnel will have to be at least 300 feet below the tunnel run last year. The 10 extra stamps have been put in the Hathaway mine, and would have been started last week, but were not, as the tappets were too small. Hon. C. F. Reed has purchased the Drummond quartz mine of J. B. Hobson, and has 10 men at work on it. This ledge prospects well and is of unusual width, being in some places 29 feet wide. Mr. Reed is now stoping out and intends to increase the force of men as soon as space will permit. He will soon have a Huntington mill in operation for testing the ore as it is taken out. J. B. Hobson informs us that the channel at the Red Point mine is now opened a distance of 1200 feet, and is paying big. The Boston Bar Co. will resume mining in the Middle Fork as soon as water can be obtained from the California Water Co. sufficient to run a hydraulic elevator. The Big Oak Flat Co. is preparing to extend its tunnel, which is now 100 feet in length. Good prospects have been found and the company has strong hope of striking it big. Luke Ferguson has taken out some very rich ore from the Kirkland mine, which he has sent to New York, whence it will be sent to Europe to be tested. D. Feliz is taking out some good ore from his quartz mine in Bear valley.

MAYFLOWER.—Placer *Argus*, July 23: Anthony Clark has sold the Orino claim at Bath to the Mayflower Co. The Live Oak tunnel is so near the Mayflower mill that they may readily use it when anything occurs that will give them time. The Mayflower has ground opened sufficient to occupy the mill and additional stamps for months to come. The Horman mine at Wisconsin Hill is now employing about 20 men, all white. The new air-shaft is about completed, and the work on the mill progressing finely, although the material is arriving rather slowly. Dan Wickman of Placerville is the master mechanic. A boarding-house 20x52 feet and a lodging-house 20x36 feet are already erected. The boiler and compressor are in position, and pipe laid to the face of the tunnel. They intend starting the Burleighs soon.

Plumas.

TO THE FRONT AGAIN.—Plumas *National*, July 27: Plumas is coming to the front again as a mining county, and from the present indications in different parts we seem to be on the eve of a mining boom. Information comes that there is quite a stir in the Spanish Ranch mining district. There are several good mines in this locality which have been shut down for some time, and our patient prospectors have lately brought to light several new mines which promise well. There have been several parties making very thorough examinations of some of the mines with the view of purchasing. The Megown is liable to change hands soon, at least there are negotiations pending for putting up a mill on the mine for working. It still continues rich. The boys panned out several $30 pans of dirt last week. The Edman, which has been bonded for some time, and which has also been in litigation, was examined last week by some capitalists, who express themselves as being much pleased with the property, and it is likely to change hands at any time, and then a big plant will be put up. Mr. J. H. White of Oakland has been up to examine the mine owned by the Shenandoah Quartz M. Co., at French ravine on the East branch. Mr. White told a gentleman at Spanish Ranch that he had taken an assayer with him to the mine and the results of the assays were sufficient to justify putting up a plant on the property. W. E. Duncan, Esq., of the Banner near Oroville, has purchased all of the mining property of A. H. Brooks, on Rush creek flat, and will get a patent for it. He was up last week accompanied by a Mr. Low of San Francisco, who made an examination of the Hallstéd. He took a large quantity of the ore below with him and intends having a careful assay made. Pete Lorenzo picked up a $400 nugget last week in the Squirrel creek claim west of Johnsville. The Plumas Eureka is looking splendid and promises to go on paying the handsome dividends it has in the past. The outlook now for the Johnsville country as a mining district is very bright. The Jones Bros. mine, the Squirrel creek claims and Little Jamison are all good pieces of property, and that part of the county will be booming soon. Benj. Jones of the celebrated Jones mine went over to Rush Creek this week to examine the Moore Owens ledge, and we are informed that he was very much pleased with it.

Shasta.

CHROME.—Redding *Free Press*, July 27: Shipments of chrome ore are now being made from Chromite station, three miles below Sims, to Baltimore, Maryland. The mine producing this ore, we understand, is the property of Clay W. Taylor and Sylvester Hull. A couple of gentlemen have leased the mine under contract to take out 3000 tons of ore, with the privilege of raising it to 5000 tons, paying a royalty of $2.50 a ton.

Sierra.

KANAKA.—Cor. *Mountain Messenger:* The new tunnel which is being run to tap the Old Kanaka lode was started April 2d and is in 350 feet, and an air shaft of 25 feet to the surface is just completed, with fire-blast connected with iron pipe leading to the face of the tunnel, and gives perfect ventilation. Recently several stringers of quartz have been crossed; the last one is five inches wide. Patten says it will go $75 per ton in gold, all of them prospected accompanied by arsenical sulphurets and iron pyrites. Since the commencement of the tunnel it has progressed systematically. The amount of work accomplished reflects great credit on Mr. Patten's management as foreman. He also has coworkers—the two Fortier Bros. and Mr. Gill. The great importance of this mining enterprise doubtless centers upon the back ledge. The tunnel, after cutting the front ledge and thoroughly developing its paying value, will be driven ahead some 300 to 400 feet into the mountain, giving an estimated vertical of 500 feet to croppings, called the back ledge, the croppings of which were sunk on and tapped by tunnel giving a back of some 70 feet, showing very nearly a continuous chute of some 600 feet in length carrying free gold and several minerals combined in the rock. Most of the ore as far as developed is of high grade.

BUTTES SADDLE MINE.—Sierra *Tribune*, July 26: There have been filed with the Secretary of State articles of incorporation of the Buttes Saddle G. M. Co. of this place. Capital stock, $500,000. Directors—Martinez Gutierrez, Wm. Swan, G. Shotter, C. Zaney and F. J. Seitz. This mine is situated directly on top of the Buttes mountain which faces Sierra City, and is about three-fourths of a mile in a straight line from town. There is no better location for a quartz mine in the district than this is. There are three different ledges which, at a distance of about 400 feet, come together and make one solid ledge. The smallest of the three ledges is seven feet, and where they verge into one it is all of 30 feet wide, as far as can be learned. The ledge is a true fissure vein and cuts the country rock. There is no part of it but where can be found plenty of free gold, and it all prospects well. At present six men are engaged in running a tunnel on one of the forks of the ledge, and are taking out some of the quartz which is revealed as they go along.

THE CALIFORNIA MINE. — Sierra *Tribune*, July 27: The California Con. M. Co., whose mine is situated about 1¼ miles above town on the south side of the river, finished the erection of their five-stamp mill last week and started two of them up last Friday. The plates are said to be looking well thus far, and a good cleanup is sure to be made. The California is owned by residents of Sierra City.

QUARTZ.—*Mountain Messenger*, July 27: A rich quartz strike was made last week at the Bedrock ledge, owned by William and Richard Phillips, near Pike City.

Trinity.

EAST FORK.—Trinity *Journal*, July 27: We first examined the group owned by Junkans & Co., named the Little Chief, Linney and North Star. This group will prove a valuable property. A good deal of work has been done in the way of development, running tunnels, inclines, etc., and the property shows well. In the North Star tunnel the ledge is four feet in width, is well defined, and has all the indications that, to a miner's eye, denote permanency. The ore is of fair grade and the crushings have been satisfactory. There is a little prospecting mill running on the ore which will probably be replaced before fall by a 10-stamp mill. Above the North Star is the Crown Point, owned by Harthen, Durkes, Bergin & Laws. A good deal of work has been done on this mine. The ledge runs from eight inches to two feet in width, and is good milling rock. The walls of granite and porphyry are well defined. The ore carries free gold and sulphurets. Samples crushed at the Selby Smelting Works went $38 to the ton in gold and $1.70 in silver. Their shaft cuts the Effie G., a continuation of the Crown Point. Leaving the North Star mines, we passed down the road to the Enterprise, owned by Balch, Day, Leavitt & Lobdell, The Enterprise has been, for the past two years, the best paying property in camp. The ore has averaged $100 to the ton when crushed by arastra. The company have done a large amount of development work and are now engaged in putting up a fine 10-stamp mill. On the opposite side of the creek are the Poorman and Sunny Side mines, on which considerable prospect work has been done, and which show strong ledges of very good ore. On the same side as the Enterprise is the Fritz, which carries a very good vein of ore. Following up the wagon-road about a mile, we came to the Yellowstone mines, owned by the Niagara Mill & Mining Co. The company have a great many locations in this vicinity and have done a large amount of work on them. The rock taken out is crushed by an arastra. These mines are reported sold to a German syndicate. About eight miles above these mines on the East Branch is the Golden Chest mine, owned by a San Francisco company, on which is a fine five-stamp mill with concentrators, rock-breakers, etc. Owing to litigation, work is suspended. About three-fourths of a mile above the Golden Chest is the Red, White and Blue, owned by Kroumpe & Stiller. The ledge is eight feet wide, carries free gold and sulphurets and looks well. The ledge shows up well and the ore is of good quality; two sacks of ore sent below for a working test went $60 to the ton. In this vicinity are a number of locations on which prospect work has been done. There is another group of mines between East Branch and Yellow Jacket creek. The mines are situated in a strip of country four miles long; they look well. The Davis Bros. have a number of locations all showing quartz prospects; they have run a tunnel in on one ledge 115 feet and found $40 rock. Three miles above them Nicol, Zuello & Junkans are working their ledge; they have run in a tunnel tapping the ledge at a depth of 50 feet and are now drifting on the ledge, which is five feet wide and prospects well. This section is full of ledges. Hubbard and Given have an eight-foot ledge joining Davis Bros. that prospects well; not much work has been done on it, however. About five miles above North Fork on the right-hand side of East Fork are a cluster of mines on Barney and Rich gulches that offer fine inducements for a syndicate to handle. They are favorably situated to be worked by one company and deserve the consideration of capitalists. A branch wagon-road leaves the main road at the Creek and winds up the mountain above the mill to the Thanksgiving mine. Peterson & Co. have nearly completed their mill and will soon begin crushing ore from the Fountain Head and Thanksgiving. The mill is a fine one, has all the modern improvements and can crush 25 tons a day. On the Barney gulch side are the following mines: Arkansas, Star, Orland, Saturday Night, Belle, Web-foot, Violet, and Grizzly. These are all owned by responsible parties, and on most of them considerable work has been done. All have ledges carrying free gold and most of them sulphurets. On the Rich gulch side are the Lobdell ocations, Hardscrabble and the Ozark, owned by Day & Greenwell, one of the finest properties in the district. The ore averages $100 a ton and the tunnels have opened up a large body of it. An arastra is running on the mine.

SURVEY.—The superintendent of the Altoona quicksilver mines is contemplating making a survey of a trail from Sims, Shasta county, across country to the mine, for purposes of quicksilver transportation. The present shipping distance to rail is 70 miles, and the proposed trail will cut off at least 50 miles.

Tuolumne.

CHINESE CAMP. — *Independent*, July 27: The work at Moffit's mine is progressing rapidly. A full force of men is engaged constructing the works. The water is at a very low stage.

MARY ELLEN.—Another shoot of rich rock was discovered in the Mary Ellen mine, last week, in the upper tunnel. The vein is now 2¾ feet wide and shows gold freely. The mill will be ready to run inside of 30 days.

Ventura.

THE PIRU MINE.—Cor. Ventura *Vidette*, July 27: The Piru mining district seems to be slowly but surely coming to the front. Work on different prospects is advancing and the attention of capitalists and mining men is being attracted to the district. A good portion of the country has never been thoroughly prospected, and, judging from what has been discovered, other rich discoveries may be made. That a bright future is before the Piru district is undoubted. The mineral belt is a large one and in this is included the Alamo, Fraser and Pinos mountains. Fraser mountain has been the most thoroughly prospected, and seems to be a large mountain of mineral only awaiting capital to develop it. Although very rich ore has been found, most of the ore is low grade and there are vast quantities of it. And this low-grade ore is what will some day cause the Piru district to rank as one of the richest mining districts on the Pacific Coast. The White Mule mine has been bonded to a Los Angeles syndicate for $10,000. Two or three handsome offers have been made for an interest in the Little Daisy, but the owners, realizing that they have a good thing that will keep, are in no hurry to sell and are not jumping at every chance.

NEVADA.

Washoe District.

CROWN POINT. — Virginia *Enterprise*, July 27: The raise from the 350 level is in vein material of a favorable character. The 300 level south drift has advanced a total distance of 75 feet. The face is in quartz yielding good assays. The 700 level south drift advanced 30 feet, making its total length 105 feet south of No. 1 crosscut. The drift shows no change for the week. The raise from the 400 level has been connected with the old 300 level stopes.

CON. IMPERIAL.—The face of the north drift on the 300 level is in a promising character of vein material. The joint Challenge, Confidence and Imperial north drift on the 500 level is in 820 feet from the Yellow Jacket shaft, 20 feet having been added during the week. The face is still in quartz giving low assays.

HALE & NORCROSS.—The north drift on the 300 level is out 261 feet. On the 400 level the north upraise is now advanced 52 feet. The top of this upraise continues in good ore, and are now putting square sets in on this ore.

CHALLENGE CON. — The joint Confidence-Challenge-Imperial north drift on the 500 level is now in 820 feet from the Yellow Jacket shaft, having been advanced 20 feet during the week. Face shows quartz giving low assays.

CON. CAL. & VA.—The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. The average assay of the ore extracted will be about the same as last week.

BELCHER.—The winze below the 1000 level is still in quartz carrying some metal. The south drift on the 1000 level is passing through quartz of excellent grain and appearance which is beginning to give low assays.

OCCIDENTAL.—The usual prospecting work has been done on the 300 level. Are stoping ore on the 350 and 400 levels. Ore is also being extracted on the 450 level. The mill is about ready to be started up.

SAVAGE.—On the 500 level the drift from the upraise is now advanced 107 feet. Men are engaged in bulkheading and retimbering in the main shaft and on the different levels.

SILVER HILL.—Usual progress made in advancing the 800 level northwest drift and the northeast drift. The raise above the southeast drift is still in porphyry.

CHOLLAR.—The usual prospecting work is being done on the 650, 750 and 850 levels. On the 650 is found quartz carrying some metal.

POTOSI.—The 750 level south drift is out 561 feet, in porphyry and quartz. The 550 level west crosscut is in clay and porphyry.

NEW YORK CON.—The upraise above the 800 level west crosscut is showing a breadth of four feet of ore assaying $35 per ton.

NORTH OCCIDENTAL. — The usual prospecting work is being done on the 300 and 350 levels. No change of material.

SEG. BELCHER.—The south drift on the 1100 level is in a mixture of quartz and porphyry that promises ore.

JUSTICE. — Shipped 200 tons of ore to the mill, showing a value of above $28 from battery sample assays.

ALTA —The usual amount and grade of ore is being crushed. The 927 level stopes show an improvement.

GOULD & CURRY.—The usual prospecting work is being done on the 300 and 400 levels.

MEXICAN.—The west crosscut on the 1465 level is in quartz that carries some metal.

BALTIMORE.—Working as usual on the 338 and 225 levels. Some ore being saved.

BULLION.—Still exploring the 760 level quartz belt. No change in the formation.

UTAH.—On the 600 level the south drift is in a favorable mixture of quartz, clay and porphyry.

West crosscut No. 3, 60 feet south of the upraise, was advanced 40 feet and cut the west wall.

UNION CON.—North drift on 1485 level still in promising vein material.

SIERRA NEVADA.—The east drift on the 520 level is still wet at the face.

OVERMAN.—Making repairs to drifts and extracting small lots of ore.

ALPHA.—The 500 level west crosscut is showing streaks of quartz.

ANDES.—Still sinking the winze below the 300 level in quartz.

OPHIR.—The upraise from the 1465 level is still in porphyry.

SCORPION.—The joint east drift is out 860 feet.

CONFIDENCE.—The same as Challenge Con.

Cherry Creek District.

GOOD REPORTS.—White Pine *News*, July 27: The mining reports that reach us from Cherry Creek are of a flattering nature. The Merrimac Co. is working 35 men and the ore in the mine is said to be showing up better than ever.

Mount Rose District.

THE RUSSELL PROCESS.—*Silver State*, July 30: Supt. McCurdy of the Paradise Valley mine thinks of putting up a plant to work ores by the Russell process near the company's reduction works on Martin creek. There are some 30,000 tons of tailings on the ground which will average $10 or $12 per ton by that process.

Osceola District.

DRY PLACERS.—White Pine *News*, July 27: Mr. Reeder's father has struck some rich placers on his ground there, which is paying handsomely by the dry-washing process.

Tuscarora District.

DEL MONTE.—*Times-Review*, July 27: North drift 225-foot level extended 10 feet showing some low-grade ore. Upraise near the face carried up 15 feet. Joint crosscut, same level, extended 17 feet, face looking favorable.

COMMONWEALTH.—Drift from No. 11 upraise has been advanced 13 feet and connected with west stopes, exposing fine ore the entire distance. The ore is developing well going east from the same point. North drift from square sets extended 35 feet, showing some fine ore. Stopes above are yielding high-grade ore. South stopes, from this point, are as good as any time heretofore. No. 7 stopes are developing well.

NEVADA QUEEN.—Winze from 450-foot level has been sunk four feet; total, 71 feet. The ore continues to show as well as in part of winze above, assaying from $30 to $360 per ton. Two hundred and eighty tons of ore have been sent to the concentrator, which is running all right.

NAVAJO.—South drift on west vein, 350-foot level, extended 13 feet. West crosscut from south drift on east vein, same level, extended 14 feet, cutting through seams of high-grade ore. Upraise, same level, extended 10 feet, continuing to show some high-grade ore.

BELLE ISLE.—West crosscut from the end of the north drift 250-foot level extended 11 feet. North drift 150-foot level extended 10 feet.

GRAND PRIZE.—Stopes are furnishing the usual amount of ore. Other work at the mine and concentrator is progressing favorably.

NORTH BELLE ISLE.—Work has been suspended below the 400-foot level preparatory to sinking the shaft.

ARIZONA.

ARIZONA COPPER CO.—Clifton *Clarion*, July 24: Two furnaces are kept constantly running by this company, and it is reported that they are now producing more copper and at less cost than at any time in the history of the corporation. The management of the different departments of the concern is now in most capable hands, to which fact may be attributed the very satisfactory manner in which operations are carried on. Three of the four furnaces have now been fitted up with large brick stacks. The remaining one will be similarly arranged. Superintendent of Smelters Colquhoun reports that the large chimneys are a great improvement over the old iron ones, the furnaces smelting a much larger proportion of their own flue dust. The large amount of flue dust which has accumulated and been piled up near the smelters—in quantity about 4000 tons—is being smelted at the rate of 13 tons daily. This dust runs from 8½ to 12 per cent copper. It is said that Sup't of Mines Ferrie has under consideration the advisability of putting in a hoisting-engine at the Longfellow for raising the concentrates, the work having reached such a depth that the horse whim is entirely too slow. The mines of the company being worked are reported to be looking well, and generally there is nothing in the outlook of a discouraging nature, but, on the contrary, the indications point to a very successful year for the A. C. Co., with probably an increased output over 1888.

UNITED VERDE.—Prescott *Courier*, July 23: Edward L. Preston, from Jerome, is in Prescott on business for A. W. Clark, lessee of the United Verde mines and smelters. Two furnaces are constantly kept running and the mines are doing well. Some 60 men—miners, furnace-men and wood-choppers—are making good wages. Heavy rains have injured the road, but the freight contractor, E. H. Witherell, has 20 men repairing damages and is hauling coke and bullion. Mr. Culver's teams are constantly arriving in Prescott with shipping ore from the Congress mine. The 20-stamp mill will soon be completed. The Catoctin mine is producing plenty of shipping ore. Mr. Liston, owner of the old Reliable mine, has, at his rooms, pieces of gold quartz that give one a good idea of the great wealth of our veins. The old Reliable is opened to a depth of about 120 feet, by shaft. There are several other openings in it but the one above is the deepest. The vein is fully three feet wide. He has worked 230 tons of it without any assorting whatever, and it yielded in the neighborhood of $37 per ton, gold. Mine-owners of Tonto Basin will soon have a mill to work their ores.

BRITISH COLUMBIA.

KOOTENAY.—Cor. Kootenay *Star*, July 25: There is no better field for capitalists to invest their money than in Kootenay districts east and west. Nearly all of the prospects will pay from the grass roots, especially at Toad Mountain, Kootenay lake, Spilemacheen, Toby creek, Windermere, Illecillewaet and McMurdo districts, and I can safely predict that when the mines of Kootenay district alone are developed, the eastern half of British Columbia will become one vast and flourishing mining camp.

ILLECILLEWAET.—John Maher has six men at work driving a tunnel; he is in 77 feet. D. Woolsey for Cariboo Creek M. Co., has six men sinking a shaft; he is down about 50 feet in an immense body of low-grade ore. Boyd, Bain & Co. are keeping the drills polished at Fish creek; they certainly have the best prospect in the camp.

COPPER CREEK.—By the sound of explosives, G. McCabe must be rushing things on the Southern Cross. He has two shifts of men at work and expects to increase this force at an early date. The property is of the nature of steel galena. The pay chute is about four feet wide but getting wider with every foot of depth gained.

DONALD.—The Porcupine placer miners are in with a nice lot of coarse gold. Placer seems to pay in that locality. G. B. Nagle's discovery claim seems to pay nicely. Nagle & Horn, who left here a short time ago, are prospecting in the McMurdo district, where they intend remaining awhile.

COLORADO.

LEADVILLE.—*Tribune-Republican*, July 25: With all that has been said about the wealth of Aspen, the fact still remains that it cannot near equal Leadville in point of production in tons and value of ore. Such a property as the A. Y. and Minnie with its $11,000,000 in sight and the Henrietta-Maid producing at the rate of 7000 tons per month, is enough to make the camp great. But there is the Continental Chief, which is now netting its owners $100,000 a month, and a score of other mines doing well. Even the "played-out" Little Pittsburg is sending better than $100 ore to market, which is found in virgin ground. Long and Derry hill is once more active, and as considerable ore is found, it is within the line of possibilities that a great mine may yet be discovered in that particular locality. There is not a mining engineer of note in the carbonate camp that is not watching developments in the locality closely. "To tell the exact truth," said a well-known Leadville mining man to a *Republican* representative, "the California mining district is better to-day than it ever was. In tonnage it may not be quite as large, but I am convinced that this is more than made up in value. Some people say that the town is dull and that as a place for business in a mercantile way it is no good. Why don't they read between the lines? Prospecting on each 300 feet of ground is a thing of the past. A shaft or a claim in a fault is no good. Ore shoots are now almost as clearly defined as the bed of a river. Sometimes they are near the surface and again they are very deep, and water by the millions of gallons must be fought. But if the money holds out the vein is found. On most of the hills the question is as closely determined as this, but there are a few localities where luck is the only guiding star."

DAKOTA.

TO TREAT REFRACTORY ORES.—Black Hills *Pioneer*, July 27: Though not generally known, it is nevertheless a fact that experiments are now being made in no less than six different cities outside of the Hills, having in end a solution of what was until recently a harder problem than many in differential calculus—the treatment of Ruby Basin and Bald Mountain refractory ores. We say until recently because the solution has already been found in the Newberry-Vautin method. The Hills, however, have no reason to complain, but should rather rejoice in the fact that the experiments are being made. The more ways found to treat the ores, the better it will be for the country. Constant effort should ultimately produce at least some economy. Another reason for congratulation is that so many different parties should be interested in finding a method. None of these at whose instance tests spoken of are now being made, are resident here. They are, however, owners of property at either Ruby or Bald Mountain, and are men of means. If experiments at St. Louis now under way meet a happy result, it means the bringing of immense capital here within a few months. The same effect may be expected from satisfactory results at other places. In the meanwhile, however, we have the Newberry-Vautin and dry smelting processes, both applicable and either economical.

UNCLE SAM.—Deadwood *Pioneer*, July 29: News reaches Deadwood that 20 stamps in the Uncle Sam mill have resumed ore crushing. Whether the run is to be temporary or permanent is not stated. It is hoped and believed, however, that the run will be continuous.

IRON HILL.—Ore hauling from mine to smelter begins next week, which would indicate the plant will be blown in at an early date. The run will be a short one, however, and is not expected to last more than 10 or 12 days. Official advices are, that though the size of the rich ore deposit has been greatly magnified by the public, the mine is developing most satisfactorily.

IDAHO.

NEW PLACER DISCOVERIES.—*World*, July 23: George Ainslie last Saturday sent the *World* extracts from letters received by Hon. A. F. Parker, from Lewiston, Idaho, as follows: "The Warrens expressman brought out news of a rich placer find discovered by 'Three-fingered' Smith and two others, 30 miles beyond Alton district, said to surpass Warrens in its earliest days, both in extent and richness. Specimens of $1 were found in numbers. Warrens is deserted. Everybody going to the new El Dorado. A party of 12 started from Grangeville. Chinese pack horses are being hired at Warrens at $15 per head to ride into the mines."

SAWTOOTH.—Ketchum *Keystone*, July 27: Five cars loaded with ore from the Silver King mine at Sawtooth were shipped from the Ketchum depot yesterday, consigned to the Grant reduction works at Omaha. Three of the cars aggregated 50,000 pounds in weight. A lot of ore from the Warrior mine on Warm Springs creek was sampled at the Ketchum sampling works during the week, which yielded at the rate of 120 ounces silver and 58½ per cent lead per ton. The strike in the Senate mine at Galena is of great importance. The discovery was made 21 feet below the lowest level, where the existence of any ore has never been suspected in past years. The ore seam at the bottom of the winze is 10 inches thick, and the ore will average over 65 per cent lead. Work has been started on the Little Chief mine. Some $14,000 was taken out of one pocket in this property, and much ore is still showing in the workings. Woods & Pearson's pack train are busy packing ore for Ole Opeland and others, lessees of the Parnell mine on the East Fork of the Salmon river.

COEUR D'ALENE.—Wardner *News*, July 20: Every day brings fresh arrivals, and those who have traveled near and far have no hesitancy in pronouncing Wardner the greatest mining center they have seen. The words of promise that we daily hear augur well. The other railroad—W. & I.—is coming, capitalists are coming, mining men are coming, and every one is coming to Wardner. The *News* will soon inform its many readers of the building of a 400-ton concentrator for the Bunker Hill & Sullivan Co., when they will need the services of 300 miners, teamsters and other workmen in their daily operations, and when the exclusive use of one line of railroad will be tested in transporting their product of ore. The future movements of the Bunker Hill & Sullivan Co. are grand in conception, perfect in detail and on a par with the magnitude of the mines under its control.

YREKA DISTRICT.—Notes of preparation are heard at the Emma & Last Chance concentrator, and the preparatory steps for the enlargement of the mill have been taken. The machinery has commenced to arrive, and the Pelton water-wheel is already on the ground. The massive water-pipe, manufactured by Holly, Mason, Marks & Co., is being put together, and when in place will be 600 feet in length. The work of grading the site for the addition to the building will be commenced on Tuesday, and no time will be lost in its erection. When finished, the capacity of the mill will be 120 tons per day.

MONTANA.

QUIET.—*Inter-Mountain*, July 27: The past week has been a very quiet one in mining circles and little has been doing. There has been the usual crop of rumors, the leading one of which is to the effect that the Anaconda Co. is to be made a stock company. At present the company has no corporate existence. It is also reported that the company has had engineers looking over the Great Falls, with a view to the possible location of a refining plant there. The latter plan is considered a very remote possibility; so remote, in fact, as to be almost an impossibility. Both reports are mere rumors, and no definite foundation can be found for them. Workmen are busily engaged at the Silver Bow shaft of the Butte & Boston Co. putting a station at the 300, and getting ready to sink to the 400.

NEW YORK GULCH.—Anaconda *Review*, July 25: This gulch, which is located in a northeasterly direction from Helena, in Meagher county, is once more coming to the front as a prosperous mining camp. The Trout creek placers are making a good showing. About 100 men are at work and are well pleased with the favorable results.

THE SOUTHERN CROSS.—The Southern Cross mine is now fast approaching the condition of development which Calvin H. Hand, the company's expert, pronounces all that is necessary to justify the erection of a big free-gold mill upon the property. The plan, it is understood, is to build a 50-stamp mill, and to sink a working shaft about 150 feet up the hill from the vein. This sunk vertically will cut the vein at a depth of from 350 to 400 feet. The prospecting shaft (incline) is 250 feet deep, and the vein has been opened by levels, both east and west, at depths of 85, 150 and 260 feet, the levels extending east about 100 feet and west over 125 feet. An upraise to the surface has also been made from the 150-foot level from a point 105 feet from the shaft. When it is stated that these developments are all in good ore and that the average width is between 15 and 20 feet, it will be readily understood that an immense quantity of ore is in sight—30,000 or 40,000 tons at least. The average assay value of the ore is about $12, though there are some bodies of considerable magnitude exposed which will average over $20 per ton. The company's expert says the gold can be saved in a free-mill to about 75 per cent of its assay value with proper care.

NEW MEXICO.

PRODUCING MINES.—Rio Grande *Republican*, July 26: The mines of the Organ mountains continue to produce a small quota of ore. This week cars were loaded from four different mines at the Las Cruces depot with ore rich enough to offer inducements to capital. About a dozen mines pay in a small way, which, if the owners had means to develop their resources properly, would be valuable properties. Below we give a list of those being worked.

LITTLE BUCK.—This mine has been worked for six years off and on, mostly under the lease system. Elijah Davis has a lease now on the east end and is getting out some high-grade ore. With the exception of the Bennett and Stephenson it ranks as the largest producer in the camp, having added over $30,000 to the world's wealth.

GREY EAGLE.—The Grey Eagle has produced rich ore in small quantities for a number of years, but only pockets, which were soon exhausted, were found. It is now reported that Mr. Steubenrauch, who is working the property, has discovered the vein and that bids fair to be a regular source of supply from this time on.

GIRARD.—This property belongs to the Philadelphia Company, managed by W. H. Skidmore. It is being worked under lease by Lew Cowan, and a carload shipment was made this week to Pueblo.

DOS AMIGOS.—This mine is being worked under lease by Younger and Barlen. They have a streak of heavy galena that runs away up in silver.

MODOC.—A shipment of a carload of sulphate ore was made this week to El Paso. A recent analysis shows that it runs about 30 per cent lead, between 5 and 10 ounces in silver and 20 per cent iron.

BENNETT.—The ore in the Bennett for a time, at a depth of about 250 feet, ran so low that it barely left a margin for a leaser, but now, to the satisfaction of all concerned, the grade in silver is increasing with depth, and it pays handsomely.

EUREKA.—This is the old Crescent City which has been making shipments for a number of years. There is more ore now in sight and a better body than the mine has ever before shown.

TOUGHNUT.—Edward Burt and A. A. McLaughlin are sinking on the Toughnut, paying expenses with the ore as the shaft goes down.

OREGON.

ANOTHER RICH FIND.—Bedrock *Democrat*, July 22: The old mining camp of Robinsonville, about 50 miles southwest of Baker City, is the center of a mineral belt extending for miles in every direction. Both quartz and placer mines have been worked for years with the most gratifying results. Near the Red Man mine, about a quarter of a mile from Robinsonville, has been made what promises to be one of the richest strikes ever discovered in Eastern Oregon. The discovery was made by Mr. J. H. Mitchell on the 12th day of August, 1888, who immediately located it, but deferred development work until about four weeks ago. The development work as yet is somewhat limited, the shaft being only 30 feet deep. The ledge is true, well defined, and is two feet wide. The ore is classed as red carbonate and carries free gold. Mr. Mitchell has taken out 10 or 12 tons of ore which he intends sending away for reduction. The mother rock, or croppings, will assay $50 per ton, and the farther down he goes the richer the ore. The specimens which are now on exhibition at Durkee & Dill's are the finest that have been brought to this city in many a day. The rock is full of wire gold which is plainly visible to the naked eye.

COAL DISCOVERIES.—Albany *Herald-Disseminator*, July 25: Wm. McKinnon, who lives up the South Santiam several miles above Sweet Home, about 45 miles from Albany, has made what seems destined to prove a valuable coal discovery. The coal deposit, which has only been opened a few feet below the surface, is in Canyon creek, and gives evidence of being an enormous vein. Mr. McKinnon, who runs a blacksmith-shop and is familiar with coal, says it is better than the average blacksmith's coal bought in the market, and he has recently been taking it out and using it in his forge. The deposit is situated about 500 yards from the main wagon-road, and Mr. McKinnon thinks it the most valuable coal discovery ever made in the Santiam region. Several coal deposits have been made in various places along the Santiam, but nothing that equals this in quantity or can excel it in quality.

SPARTA.—Bedrock *Democrat*, July 22: The mines in and about Sparta are looking well. The contractors have completed their 200-foot tunnel on the Big Pittsburg, and will now drift 100 feet on the ledge. Prospects encouraging. At the Blue Gulch mine the free gold pay chute has given out, and the richest and largest body of sulphurets ever encountered in this section is now being mined. The Winter mine, owned by Dr. A. Marrott, of Baker City, is said to be under a $50,000 bond to California parties.

POWDER RIVER is now very low and work at different places along the coarse gold streak, extending for a distance of ten miles, is being done with the most satisfactory results to the operators. Mr. Ferri, working on the claim of Jay Guy Lewis & Co., says the gravel is four feet deep to bedrock, carrying gold all the way down, and in one pan of pay dirt, fairly taken, over $5 were realized. The largest piece thus far found by Mr. Ferri weighed $6.75. The three companies of Chinese now working on Thorne gulch will commence working on Powder river as soon as their present cleanups are made.

UTAH.

TUNNELS.—*Park Record*, July 27: The first of the week a force of eight men was engaged by Smith Ehenger to clean out and re-timber the Silver Age and Minnesota tunnels situated on Pioneer ridge toward the head of Bonanza flat. The Silas Reed group of mines was developed by these tunnels, the former being in a distance of over 1200 feet and the latter about 900 feet, but no work has been done through these tunnels for two or three years. The large air compressor and blower for driving the Alliance's 4800-foot drain tunnel are in place and will soon be in working order.

OPERATIONS BY LEASERS.—The Wasatch leasers have thoroughly cleaned out the old workings with considerable difficulty and now they are opening up the vein in new ground. They have also stripped the vein in certain parts of the old workings and ere long this Bonanza property of Blue Ledge district will be shipping large lots of ore. The leasers of the Nevada and Northland are working three shifts and a horse whim. Already the shaft is down about 60 feet and the calculation is to go down 200 feet before drifting for the Woodside vein which undoubtedly runs through their ground as well as the Mayflower. The Mayflower No. 7 leasers' property is developing into a veritable bonanza and heavier shipments of high-grade smelting ore are made.

ABOUT THE ANCHOR.—Developments in the Anchor are forging ahead and the main force is at work in the south crosscut, and it is expected that the ledge will be encountered at any day.

WASHINGTON TERRITORY.

THE SILVER DUMP.—Ellensburg *Capital*, July 25: The owners of the Silver Dump No. 1 have incorporated, and propose pushing developments on their mine in Upper Cle-elum District. This mine was discovered in April, and is now being developed by a tunnel which is now in about 40 feet, tapping the ledge about 80 feet below discovery. The vein is about 60 feet between walls, and the ore assays from $80 to $120 in gold and silver. It also carries a considerable percentage in lead and copper. The new wagon-road to the mines of the Upper Cle-elum makes them easier of access, and will enable the Silver Dump Company to make some shipments this fall.

THE ARLINGTON MINING CO. of Ruby are making arrangements for the shipment of over 400 tons of mining machinery over the Ellensburg and Okanogan Steamboat line, and will begin shipments in a few days.

MECHANICAL PROGRESS.

Transmission of Heat Through Thick and Through Thin Plates.

There is a popular idea, even among experienced engineers, that the thickness of metal in a boiler has a decided effect on the rate of evaporation—thin metal transmitting the heat of the fire more rapidly than does a thicker material. For example, here is a statement taken from the catalogue of a well-known water-tube boiler:

"The thick plates necessarily used in ordinary boilers, in the furnace, not only hinder the transmission of heat to the water, but admit of overheating, and even burning the side next the fire, with consequent strains, resulting in loss of strength, cracks, and tendency to rupture. Water tubes, however, admit of thin envelopes for the water next the fire, with such ready transmission of heat that even the fiercest fire cannot overheat or injure the surface."

Another example of the same idea is found in one of the numerous technical "Catechisms" which are offered to engineers. It is as follows:

"The advantage of thin tubes is that the heat inside of them is conducted to the water outside more rapidly than it would be through thicker metal, which is important when combustion is so rapid as it is in locomotive boilers."

Of course, there must be some foundation for this idea, and it seems to be derived from Peclet's experiments, the law established by that experimenter being given in D. K. Clark's "Rules and Tables," as follows:

"The flow of heat which traverses an element in a unit of time is proportional to its surface, and to the difference of temperature of the two faces perpendicular to the direction of the flow, and is in the inverse ratio of the thickness of the element."

The foregoing quotations present, it is believed, a fair and full statement of the views entertained by the advocates of thin plates for boiler construction, with the authority for those views. It is now in order to give

The Other Side of the Question.

Peclet's experiments are ably discussed by Prof. Rankine, in his "Manual of the Steam Engine," and, as frequently happens in such cases, the reasoning of the latter has thrown new light upon the conclusions to be drawn from the experiments. After an analytical discussion of the subject, Prof. Rankine adds:

"The external thermal resistance of the metal plates of boiler flues and tubes, and other apparatus used for cooling and heating fluids, is so much greater than the internal thermal resistance, that the latter is inappreciable, in comparison, and consequently the nature and thickness of those plates has no appreciable effect on the rate of conduction through them."

Experimental proof is always valuable in the determination of any question, and, fortunately, such proof is available in the present case, the experimenter being Prof. Walter R. Johnson, well known as an experienced and careful observer. A work by Prof. Johnson, entitled "Notes on the Use of Anthracite in the Manufacture of Iron, with some Remarks on its Evaporating Power," contains the following passage:

"Mr. Parks lays considerable stress upon the thickness of metal of which a boiler is composed, as influencing the rate of evaporation, and also on the temperature of combustion, as affecting the durability of boilers. In regard to the former of these points, I may mention that my own experiments on iron of different thicknesses, from one fi tieth to one fourth of an inch, and those of Mr. Hayes, from one-eighth up to one inch, prove that within these limits, which are, in both directions, far beyond the requisitions of the steam boiler, no sensible difference will be produced in the evaporative effect of fuel And with respect to the second point, I would refer to the fact, first established by my experiments, published some years since in the *American Journal of Science*, and since reproduced both in England and in this country, that, so long as water is in contact with iron under atmospheric pressure, the metal will not receive a temperature much more than 100° Fahrenheit above the boiling point; for from 312° to 324° is reached the temperature of maximum vaporization—a rate of generating steam far beyond the practice even in locomotive engines." (It is to be noted that this was published in 1841)

The above quotations, to say the very least, throw considerable doubt upon the positive statements about the effect of thick plates, and, unless the advocates of thin plates can offer proof to overthrow the analytical and experimental results of Professors Rankine and Johnson, it might be well for them to be less dogmatic in their assertions. The subject is an interesting and important one. Perhaps some of your readers can furnish additional facts or data.—*Richard H. Buel in American Machinist.*

MICA AS A LUBRICANT.—A company has been organized in Denver, Colorado, which is introducing a new lubricant, the body of which is finely ground mica. It is said that the Rock Island railroad has been experimenting with it, with very satisfactory results. They cooled off journals that came in heated, by applying mica, and the agent reports that one which came in very hot was sent forward as soon as the mica lubricant had been applied. The train dispatcher received reports from different stations on the road where it had cooled off journals and was running all right. The experiments that have been made with mica lubricant and mica dope have been successful. The one was made with crude oil and mica, and the residuum from the wells, being a very much cheaper grade of oil. The officials of the Union Pacific and of the Denver & Fort Worth roads have also applied for the privilege of a test. The mica is ground to a most excessive fineness. The Denver *Scientific Record* says it will be curious if this singular mineral should be found to be a lubricant, to serve so useful a purpose as that of a substitute for that crudest of devices, a huge clot of waste saturated with oil.

WINDING A HEAVY SPRING.—A heavy spiral spring was wanted for a line shaft to show the amount of power that was being transmitted. A long bar of steel was sent for and soon one end was heated in a forge. A piece of steam pipe some six inches in diameter was laid over the fire and held in a frame, with holes in one end for a bar to turn it with. The bar of steel was then made fast to the pipe with a tap bolt, and the winding of the spring commenced. The fire came so near the bite of the roll, or the spot where the bar first begins to bend, that it was wound as fast as it became heated, and all that was required was to keep up a constant strain on the driving lever and let the bar take care of itself until the coil was finished. After winding, the coils can be opened, to give them clearance, with a cold chisel.

FOR CEMENTING IRON.—The following mixture has been used, says a cotemporary, with the greatest possible success for the cementing of iron railing tops, iron gratings to stoves, etc.; in fact, with such effect as to resist the blows of a sledge-hammer. This mixture is composed of equal parts of sulphur and white lead, with about one-sixth proportion of borax, the three being thoroughly incorporated together, so as to form one homogeneous mass. When the application is to be made of this composition, it is wet with strong sulphuric acid, and a thin layer of it is placed between the two pieces of iron, these being at once pressed together. In five days it will be perfectly dry, all traces of the cement having vanished, and the work having every appearance of welding.

OILING SELF-LUBRICATING BOXES. — One trouble with self-oiling boxes, where a line shaft has been provided with this means for lubrication, says the Chicago *Journal of Commerce*, is that they will go so long without oiling that the one who has them in charge forgets all about them, and loses all thoughts of a hot bearing until the shaft cuts through the lining of the boxes into the cast iron, and has grooved the shaft all to pieces. An oiler can look after all the bearings every day as well as not, and give the jack shaft his closest attention once a week without fail; but time flies so readily with his trade that a year and six months have gone by before the six weeks are up in his calculations, the extent of which a self-oiling box is supposed to take care of itself.

STEEL TAKING THE PLACE OF WOOD IN RAILROAD CARS.—Steel seems to a great degree to be taking to a constantly increasing extent the place of wood in the construction of railway rolling-stock. Truck frames, made of hydraulically pressed steel plate, are now produced, and it is proposed, by means of special shapes in which it may be pressed, to use it in place of wood in building locomotive cabs, and eventually in building cars. A great saving in dead weight, smaller number of parts and decreased cost are pointed out as the result of such a change in the manner of construction.

THE WORLD'S INDUSTRY.—"The question for the world of industry is, who can give us a safe and serviceable water furnace?" To the above remark by the *American Artisan*, the Chicago *Journal of Commerce* replies: "No; the man who can give us the best gas furnace, the gas to be evolved by the combustion of the most common, cheap and worthless material, or from atmospheric elements, at the least expense and trouble, will solve the biggest problem of the age."

CHEAP ALUMINUM.—A practical inventor of New York City says that he has discovered a method of mechanically separating aluminum from clay, of which it is the chief ingredient. He claims that he will produce this metal at a cost which will not exceed cast iron. He is about to take out a patent for his process, the nature of which he is unwilling to disclose.

PULVERIZED FUEL. — Coal-dust triturated into dust as fine as flour has just been tested as a fuel for iron-making at the Morehead mill, Sharpsburg, Pa., and found to accomplish as much in one hour as the gas furnace does in one hour and a quarter. Being mine refuse, it costs nothing.

THE GREAT CENTENNIAL ENGINE. — The famous Corliss engine that was built to drive the machinery of the Centennial Exhibition of 1876 is now in the shops of the Pullman Car Co. at Kensington, near Chicago. It is the largest engine in the world.

SCIENTIFIC PROGRESS.

Chinese History.

How It Is Compiled by a Commission of Literary Men.

A writer in the *North China Herald* of Shanghai says that Chinese history is compiled by a permanent commission of accomplished literary men, who are always at work upon it. In 1737 an imperial edict stated that history ought not to be written for the Emperor's use only, and remain shut up in golden caskets and marble chambers; it ought to be made accessible to all officials, that they may know the mind of the Emperors and the laws of the land.

From the Chinese standpoint, history is divided into two parts, one an exact narrative of events, the other a record of what the Emperor has said and done. This division originates two sets of publications, one in which the officers speak, the other in which the Emperor is the spokesman. In the first, the industry of the bureau of history is run in the collection of facts, but there is always a danger that the recorder may be under a strong court influence. Historical candor can scarcely find a place in reference to nations or persons who have been in conflict with the court. With this exception, the array of facts thus recorded is most valuable.

The edicts published in the second series express the mind of the Emperor. He is always a man who has the advantage of good training, and if his style is tolerable and he happens to be fond of writing his edicts himself, they will all be transmitted to future times in full. The scribes, who stand writing when he speaks, translate his spoken words into official phrases, and his opinions and decisions will then pass into official history, partly written by himself and partly by the scribes of the cabinet.

Besides these there are various series of historical works—the first having been prepared in the eleventh century—to popularize the subject and place the chief facts of the Chinese annals within the reach of common readers, who have not the opportunity to study them in full. The last of these has just been published. It deals with the reign of Kienlung, from 1736 to 1795, and is in 60 volumes. Every important public matter is recorded under the day on which it occurred. The Emperor has, as usual, the lion's share of the talking, and there is room for him to say a good deal in 120 chapters, some of them very long.

Dalura Decoration.

A very marked advance in art decoration has been made by Messrs. Ludwig & Radeke in their process for producing designs in relief in solid wood by the combined agencies of heat and pressure. This process, the results of which are known as dalura decoration, is carried out by the aid of a small machine measuring only 3 feet 6 inches in hight (plus a stand 1 foot 6 inches high) by 3 feet wide and 2 feet deep in plan. The main working part consists of a pair of horizontal steel rollers revolving slowly and heated in the interior. The upper roller carries around its circumference the pattern, the lower roller being smooth. The wood, which may be of any quality and length, is passed between these rollers under pressure, and upon the upper side the pattern is produced, the surface being compressed. The pattern comes out in relief, which is varied in depth according to the style of work. The grain of the wood is retained, the background being toned from a deep to a pale brown, or left plain, as desired. The depth of color is regulated by the heating of the upper roller and the rate of travel of the wood, the raised design standing out in the natural color of the wood.

We recently inspected the working of this process at the office of the company, 24 Queen Victoria street, London, where we saw an elegant pattern produced on wood 8 inches wide at the rate of about 1.4 foot per minute. An important feature of the dalura decoration is that it resists the action of damp in a remarkable degree. Some samples were shown us which were said to have been immersed in water for several days without any prejudicial effect being perceptible on the work. The system was shown as applied to furniture and internal decoration in a variety of patterns, and both in the curved and straight form. It is claimed that the dalura decoration, being waterproof, is applicable alike to indoor and outdoor ornamentation, and, from the saturated but uninjured state of the sample we examined, we think the claim is a reasonable one. We are satisfied that the process is one which will enable art decorations to be indulged in, where otherwise their introduction would prove prohibitory on the score of costliness.—*London Iron.*

HOW A SOLDIER ESTIMATES DISTANCES.—It constantly happens that men detached from the main body of an army are called upon to determine for themselves their distance from an object to be fired at. No assistance can be given—nothing but a stern reliance upon one's judgment and the size and appearance of surrounding objects. Experience abundantly proves that even the rawest of recruits may be taught to estimate distances approximately from his base-line to at least 2000 yards away, and by simple, rapid observation. Every soldier is supposed to have good eyesight; he therefore, after a little practice in sight-estimating, learns the following facts: At 30 yards the white of a man's eyes is plainly seen, and the eyes themselves at 80 yards. At 100 yards all parts of the body are seen distinctly, slight movements are perceptible, and the minute details of the uniforms can be distinguished. At 200 yards the outlines of the face are confused and the rows of brass buttons look like yellow stripes. At 300 yards the buttons are no longer visible. At 400 yards the face is a mere dot, but all movements of the legs and arms are still distinct. At 600 yards details can no longer be distinguished, though the files of a squad, if the light be strong, can be counted. At 800 yards the men in a squad cannot always be counted nor their individual movements distinguished. At 1000 yards a line of men simply resembles a broad belt; the direction of their march can, however, be readily determined. At 1200 yards infantry can be distinguished from cavalry. At 2000 yards a mounted man looks like a mere speck or dot. The above rules are applicable in the beginning only to smooth, open country, but after a little practice they apply also with equal force to rough, broken country as well.—*Cleveland Leader.*

Is the World Wearing Out?

Everybody knows that the world is wearing out, says the Chicago *News*—that the time is coming when we will have no coal and no iron. A close record of the output of the oil-fields discovers the fact that petroleum reservoirs are running dry and investors have not the faith in the inexhaustible flow of natural gas that the sellers of wells would wish. We know that the precious metals are dug out in less quantities than formerly; that the diamond market, in spite of Kimberley, is cornering itself; that the mahogany and pine will some day be things of the past, like the buffalo robe and dodo. We are confronted with the fact that the guano deposits will not last forever, that there is a human limit to the production of electricity, and that our children several times removed will have neither quinine, chloroform nor aniline dyes.

Of course this general exhaustion of old earth's treasure-house is some time ahead of us. It will not happen in our day nor in the next century. We can go on burning the candle at both ends for a few hundred years before humanity has to adjust itself to the newer or more economical conditions. But despite the fact that the time of stress is so far ahead of us that we can look on it jokingly, it is pleasant to learn that science is getting ready for the rainy day. We are on the eve of a new age and on the threshold of a new civilization. Aluminum, according to nature, is making ready to take the place of steel, and it will be cheaper, lighter, stronger and one thousand-fold more plentiful and cheap.

Its price now puts the new elements in the debatable land between pure chemistry and practical commerce, and it is a question of time merely when we shall build our houses, our telephones, and our air-ships out of the silvery core of our common clay, instead of heavy and refractory iron.

Heat and food, according to science, we are to gather from the sea in proper fish culture and wise electrical work. The economist brightly believes that we will solve the labor problem before the middle of the twentieth century, and solve it to the satisfaction of both parties.

ELECTRICITY is a peculiar agent, capable of producing certain very astonishing results. There are different forms of electricity and different ways of generating it. Statical, dynamical and magnetical electricity or magnetism are its various forms. It may be generated by means of friction, percussion, heat, chemical action, cleavage, and by magnets. The effects of electricity in its different forms are manifested as attraction, repulsion, light, heat, violent commotions and chemical decomposition. According to the generally accepted theory, there are two so-called electrical fluids, and these two are mingled together in equal proportion in all bodies. These two fluids are called positive and negative electricity. It is found that when two bodies are electrified with the same kind of electricity—as both with positive or both with negative—they repel each other; but when the two bodies are charged with opposite kinds of electricity—as one with positive and one with negative, or when one body is charged with either kind while the other is left in its normal condition—then the two bodies attract each other. The glass insulators on telegraph poles prevent the electricity from leaving the wires and running off into the ground; and the non-conducting materials placed around the wires of submarine cables so protect it that a small charge of electricity will carry a message across the Atlantic. Consequently, when it is desired to insulate electricity, and keep it from running off into surrounding objects, the medium containing it is surrounded with a poor conductor. Of these preventives or non-conductors, amber, glass, sulphur and silk are the most prominent examples.

THEODORE URBAN, an antiquarian and student of Columbia, says he has evidence that this continent was settled about 650 years after the deluge; that the different tribes that sprang up were in constant communication, sharing alike in its high civilization, and that they not only used stone but tools of metal.

GOOD HEALTH.

The Length of Life.

Life-insurance men have made of the question of longevity almost a determined science, with an ample array of figures and rules. According to these, the average man who has reached the age of 60 has still a little less, and the average woman who has reached the age of 60 a little more, than 14 years to live. But the expectation of life does not, relatively, diminish with the advance of years, for at 80 the man's chance is somewhat less, and the woman's somewhat more, than five years and a half. According to the English standards, the persons who live longest are members of the clergy, while in other pursuits longevity ranks in the following order: Farmers, merchants, soldiers, clerks, teachers and physicians. The death-rate among the clergy of the Established Church of England is exceptionally low, being in the years of active clerical service only 10 in 1000 of population, whereas that of the English Catholic clergy is 50 per cent higher.

The figures of the insurance companies, which are ample regarding every point involved, show that, the age of 50 passed, the expectation of life is more than twice as great for the temperate as for the inebriate, the proportion being as seven to three. The proportion of the rich as compared with the poor, over 70, is about four to one, and it is generally higher among women than among men.

We suppose there is no country of the world where the science of long life, accompanied with good health, unimpaired mental faculties, good digestion and great activity, is better understood than in France, and there, of 1000 persons born, 120 reach the age of 70, and the percentage continues to be high until 85 is passed.

The nervous, exciting, restless life of most Americans is not conducive to extreme longevity, and the steadily large immigration of those who have reached the years of manhood in other lands as emigrants tends to greatly reduce the standard of longevity in this country; but the tables of American insurance companies show that it is steadily rising. Should this increase continue, it may not be many years before the rate here will compare favorably with what long experience and repeated proofs have shown to be the normal rate in other lands.—*N. Y. Sun.*

Facts About Insomnia.

Are you afflicted with insomnia? Perhaps you have too much time for sleep. Perhaps you depend too much on sleep for rest and recuperation. For sleep is not the sole rest of used-up nerves. Sociability, congeniality and the enjoyment of good company rest the body quite as much as sleep. The dreary monotony of life in many a household, involving this tumbling into bed with the mechanical regularity of a machine at 9 or 10 o'clock in the evening, does not always rest weary bodies. "Early to bed and early to rise" does not always make a man healthy, wealthy and wise. Numbers of organizations are only capable of only five or six hours of sleep at a time, and their early lying down to rest is often succeeded by an early waking up and a consequent restless tossing for hours preceding daybreak. The practicers of punctuality are often surprised after breaking their cast-iron rules, and passing two or three later hours of mirth and jollity past their usual bedtime, to find themselves even more refreshed in the morning than usual. The relaxation of sociability has rested them more than sleep would, or an attempt to sleep. But these are conditions not so easily reached in the average family.

In fashionable life we have a formal, exhausting, mechanical evening of more or less dissipation. On the other hand, the evenings of great numbers of families are a monotonous humdrum. They involve the assemblage of the same people, the same surroundings, the same paterfamilias yawning over his paper, and the same querulous mammas overladen with family cares. Fresh people, with fresh thought, fresh atmosphere, anything to stir up and agitate the pool of domestic stagnation, are sadly needed and sadly scarce. There needs to be also a constant succession of such fresh people to bring about these results.

The world is full of men and women, and in a better regulated life it would be their business after the day's work was done to entertain each other, and give each other fresh life. As it is now, hundreds if not thousands of our households are little better than cells for the incarceration of each family. Thousands are thus worn out prematurely from utter lack of domestic recreation. There might be written over the graves of hundreds of thousands, "Bored to death by the stagnation of domestic life."—*Christian at Work.*

LOCKJAW TREATED BY ABSOLUTE REST.—Prof. Renzi of Naples records several cases of tetanus successfully treated by absolute rest. The method advocated is as follows: The patient's ears are closed with wax, after which he is placed in a perfectly dark room far from any noise. He is made to understand that safety lies in perfect rest. The room is carpeted heavily in order to relieve the noise of stepping about. The nurse enters every quarter of an hour with a well-shaded lantern, using more the sense of touch than sight to find the bed. Liquid food (milk, eggs in beef tea, and water) is carefully given, so that mastication is not necessary. Constipation is not interfered with. Mild doses of belladonna or secale are given to relieve pain. This treatment does not shorten the disease, but under it the paroxysms grow milder, and finally cease. Numerous physicians attest to the value of this treatment.—*Medical Bulletin.*

DISINFECTION OF THE SICK-ROOM.—In the sick-room no disinfectant can take the place of free ventilation and cleanliness. It is an axiom in sanitary science that it is impracticable to disinfect an occupied apartment, for the reason that disease germs are not destroyed by the presence in the atmosphere of any known disinfectant in respirable quantity. Bad odors may be neutralized, but this does not constitute disinfection in the sense in which the term is here used. These bad odors are for the most part an indication of want of cleanliness or of proper ventilation; and it is better to turn contaminated air out of the window or up the chimney than to attempt to purify it by the use of volatile chemical agents, such as carbolic acid, chlorine, etc., which are all more or less offensive to the sick, and are useless so far as disinfection—properly so called—is concerned.

EXCESSIVE BEER DRINKING.—Last week saw two prominent brewers buried, and two others of the guild are near dying. None of them were, or are, over 47 years old. Kidney and heart disease were the causes of death in the case of Mr. Ringler and Mr. Schmidt. Similar ailments have marked the two gentlemen for the grave. The question arises, was it beer or champagne that caused these diseases? In this connection the statement of a physician of Bellevue Hospital once made within my hearing is not amiss. These are his words: "The worst cases of alcoholic ailments coming under our observation are those resulting from excessive beer-drinking."—*N. Y. Truth.*

A SOURCE OF INDIGESTION.—It has been proved that the stomach never performs its duty so effectually as when called to act on a variety of food, provided, of course, that the food is well cooked. The popular opinion now is that a dinner consisting of three or four varieties of solid food is more easily digested than the meal which is confined to one sort only. The old-fashioned notion of a single joint and a simply made pudding is pronounced to be a fruitful source of indigestion.

USEFUL INFORMATION.

Fly-Time.

What a world of painful memories the words bring to the mind of the housewife! What recollections of deceased insects found in the butter and the milk! What traditions of flapping towels to drive the pests from the premises and of scouring the woodwork after their departure! To the bald-headed man, fly-time is not attractive. The irreverent flies use his smooth head for a resting-place, and he smites himself heavily thereon in the vain attempt to cause a decrease in their number.

To the horse, if horses have the power of memory to that degree, the approach of fly-time must be filled with agonizing expectation, and its arrival but a realization of his fears. He is tormented by flies singly and in groups. They buzz about his ears and tickle his nostrils. Those who have been supplied by a divine Providence with the proper instruments, proceed to make a meal of his blood. He thrashes about, stamps his feet, and tries to brush them off with his tail, but, that appendage, even if his humane owner has not cut half of it off, will not occupy more than one place at a time.

How to Get Rid of the Pests.

The Louisville *Commercial* states how a prominent druggist of that city hit on a novel scheme to get rid of the troublesome insects: "Bodine, a druggist in Louisville, runs a soda-fountain, and everybody knows how the flies are attracted by the syrups, etc. The druggist was almost in despair at the swarms of these buzzing pests which made their rendezvous at his store. He dared not use the insect powder in the ordinary way, and the fly paper was too filthy to be considered. In the midst of his dilemma he accidentally discovered that the insect powder is of almost as rapid combustion as gunpowder, though the flame lives several seconds. By a further investigation he discovered that a portion of the powder thrown from the bellows through the flame of a lighted match held six inches away, produced the required flame, and was capable of destroying flies by the million. He, therefore, puts out some bait for them every morning. When they have collected in sufficient numbers, he gets his powder and match, and the work of destruction is sure and swift. No guilty fly escapes the scorching of the wings. By this means all the flies in the store can be destroyed in a few minutes, and their flayed remains are dumped into the street by the gallon."

In the same paper we are told that other soda-fountain men have adopted the idea, and they say it works like a charm.

THE PROPER WAY TO PUT DOWN A SILK HAT.—Somebody gives the following advice under the above head: It may seem a very simple matter to lay our silk hat down properly, and it is, but the following from a fashionable hatter will show that there is one simple way, which is the best: "Never place your tile so that the crown will lie flat on a table. It is quite a common thing for men to do, and then drop their gloves into the hat. Besides injuring the gloss, this method permits dust, if indeed it does not permit grease, to collect on the crown, and thus necessitates frequent ironing. Don't rest the hat on its rim erect, either. Nothing will change the shape so much as this, besides giving the tile an opportunity to flop over and possibly drop on the floor. Again, never hang up a tall hat. Nine chances to one it will get brushed off the hook or nail. Never hold a tile in your hand. If you do so you will surely put the front part of the rim out of shape. Don't hold your hat by the side of the roll, no more than you should pull your ears out from the side of your head. In either case the result is the same. Having avoided all these errors, place your hat carefully on a table so that a trifle of the roll and a trifle of the edge of the crown will support it. In this way the weight of the hat is evenly balanced, and only a little of the silk will come in contact with dust or other foreign substance."

GLOVES MADE OF HUMAN SKIN.—"Gloves which are sold as kid are often made of human skin," said Dr. Mark L. Nardyz, the Greek physician of 716 Pine street, recently. "The skin on the breast," continued the physician, "is soft and pliable, and may be used in the making of gloves. When people buy gloves they never stop to question about the material of which they are made. The shop keeper himself may be in ignorance, and the purchaser has no means of ascertaining whether the material is human skin or not. The fact is, the tanning of human skin is extensively carried on in France and Switzerland, and the product is manufactured into gloves, which are largely imported into this country. Thus, a person might unknowingly be wearing a portion of a distant relative's body upon his hands." So says the Philadelphia *Record.*

WHISKY AND MELONS.—A gentleman who has tried it vouches for this story: Taking a gallon jug of whisky, he passed a cord through its cork, which cord he dropped to the bottom of the jug. The twine was then introduced into a watermelon vine, by slitting the vine, and the vine permitted to produce only two melons. When the melons were matured they were served at a private barbecue to six gentlemen. The effect was astonishing. The gallon of whisky got in its work. Not a drop of the liquor remained in the jug when the melon was ripe.

FEEDING A DOG.—How often is it best to feed a dog? I have an English setter pup about four months old, and nearly every one I have asked about this matter of feeding gives different advice. Some say feed three times a day, some twice and some only once. *Ans.* Three times a day now, falling to twice a day when the dog is six months old. After a dog is nine or ten months old, once a day is often enough.—*Forest and Stream.*

AN AGRICULTURAL DEVICE WANTED.—The State Grange of Illinois, through its Executive Committee, headquarters at Joliet, offers $10,000 to be paid to any one who will invent a machine or device to attach to reapers that will bind wheat and oats with straw. Such a machine might be useful in the slow process of harvesting in the East, but would be useless in California.

SMALL articles of brass and copper may be whitened by boiling them in a solution of three-fourths of one pound cream of tartar, two quarts of water and one pound of grain tin or any pure tin finely divided. The tin dissolves in the cream of tartar and is again precipitated on the brass or copper.

THE EIFFEL TOWER has had a chance to prove itself of practical value. A barge having become disabled on the Seine by night, the electric light was turned on the river, and the sailors were enabled to save both themselves and the cargo.

CURIOSITIES OF RAINFALL.—An odd scene occurred the other day in two hay fields not an eighth of a mile apart at Lancaster, Pa. In one, all work was stopped for the day by a pouring rain, while in the other not a drop fell all day.

WOLVES IN RUSSIA.—The number of wolves in European Russia is estimated to be about 175,000. These wolves destroy annually 180,000 head of cattle, 500,000 sheep, 100,000 dogs, besides 150 human beings.

AMERICA publishes more papers than all the rest of the world combined. Last year its 17,107 periodicals printed the enormous number of 2,958,556,500—enough to supply every soul on earth with two newspapers.

ALUMINUM for dental purposes is said to be coming into favor. It is pronounced better than rubber and less in cost than gold. It is bright, strong, odorless, and as healthy to the gums as gold or platinum.

SET a small box of lime in the pantry and it will keep it dry and the air pure.

ENGINEERING NOTES.

NOVEL ENGINEERING.—The operations on the seawall of this city, which have been progressing for some months, preparatory to laying the concrete foundations upon which the new ferry buildings are to rest, are now approaching a definite basis. The work done heretofore has been principally the tearing down of the old superstructures, dredging out the slip and the removal of obstructions; but of actual construction work thus far but little has been accomplished. The laying of the concrete foundation will be commenced in a few days. It will extend a distance of 450 feet, from a point about 150 feet easterly from the line of East street. This wall will be built in sections of about 75 feet in length, and in order to do this a coffer dam 76 6 feet in width and 22 feet in depth is being constructed, and is now about ready for submersion. This coffer dam will be sunk to the foundation, and is water-tight. After it has been sunk the water will be pumped out and the work below the water-line will be proceeded with as if it were being done on dry land. When the first section is completed the dam will be raised, and then sunk again for the building of the next sections. In some respects the work to be done at this section is novel to our local engineers, and is therefore to a certain extent experimental.

QUEEREST OF ALL CANALS.—"The strangest canal in the world is the one I never saw mentioned in any book or newspaper," said a clergyman to a St. Louis *Globe* writer. "It is a canal sixteen miles long, between Worsley and St. Helens, in the north of England, and is underground from end to end. In Lancashire the coal mines are very extensive, half the country being undermined, and many years ago the Duke of Bridgewater's managers thought they could save money by transporting the coal underground instead of on the surface. So the canal was constructed, the mines connected and drained at the same time. Ordinary canal-boats are used, but the power is furnished by men. On the roof of the tunnel arch are cross-pieces, and the men who do the work of propulsion lie on their backs on the coal and push with their feet against the crossbars on the roof. Six or eight men draw a train of four or five boats, and as there are two divisions in the tunnel, boats pass each other without difficulty."

HARRY MEIGGS' SKY RAILROAD TO BE ABANDONED.—The telegraph announces that the Verugas bridge, recently destroyed by heavy floods in Peru, will never be rebuilt. This indicates that the Oroya railroad, one of the marvels of engineering skill, will be abandoned. It was built at an enormous cost by Henry Meiggs, who fled from California in 1854, to escape the consequences of a fraudulent career in San Francisco. He went first to Chili, gaining the confidence of the Government of that country, and made money as a railroad contractor; then went to Peru, where the Government assisted in the great work of building a railroad over the Andes. The track climbed the mountains to an altitude of 12,000 feet, and work was then temporarily abandoned. Meiggs died. It was the intention to push on into the fertile interior, but nature seems to have now put her veto on this.

THE BEAR RIVER CANAL OF UTAH.—The great Bear River Canal is to be one of the grandest irrigation projects in America. Two million dollars have been provided for its construction. To get the river along the side hill along Bear River Canyon and out on to the plain near Plymouth will necessitate moving 220,000 cubic yards of solid rock, 19,000 cubic yards of loose rock, 1,528,000 cubic yards of earth and digging 1200 feet of tunnel. This canal will irrigate 200,000 acres in Salt Lake valley, 6,000,000 on Bear river, increasing the value of the land to $50 per acre, while fencing, building and tillage will double this valuation in a few years. Bear Lake is in Southeastern Idaho. The reservoir for this canal covers 150 square miles and the canal will secure the irrigation of a territory extending to Ogden.—*Salt Lake Dispatch.*

THE HUDSON TUNNEL.—It is a singular fact that the tunnel under the Hudson, one of the biggest enterprises of modern times, is rarely mentioned in the newspapers. The tunnel is going quietly forward. There has been expended on it $1,000,000, and $2,500,000 is in hand to proceed with. The distance is 5600 feet. One of the two passages is completed a third of this length, and the other more than a tenth of it.

THE CONGO RAILROAD.—The telegraph reports that all the money needed to build and equip the Congo railroad has been subscribed. The amount raised is $5,000,000. The subscribers include leading banking-houses and capitalists in Belgium, France, Germany, England and the United States.

FRICTION ON THE HEAD.—"A great many people still firmly believe the old notion that friction on the head stimulates the intellect," said a barber the other day, as he stropped his razor with a contemplative air. "I know several lawyers who just before they are to make a plea invariably have their crowns vigorously rubbed. They say that it not only brightens up their ideas, but gives greater power of concentration upon a single thought."

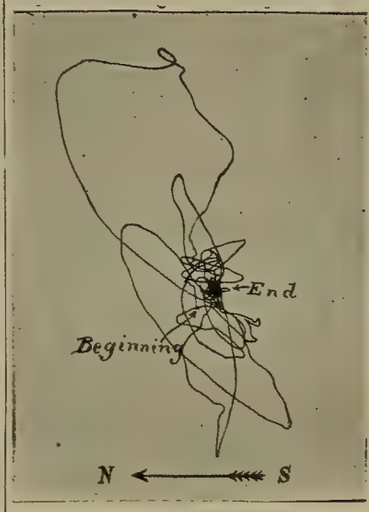
Passing Events.

The finding of a strong flow of natural gas while boring for coal at Roslyn, near Ellensburg, is a very important thing for that portion of Washington Territory. As that region is being developed by capital and increased population, its great natural wealth becomes more apparent.

The earthquake of Wednesday morning, though of short duration, was the most severe experienced here since the memorable one of 1868.



The White Lead Trust has secured the controlling interest of 96 per cent of all the United States companies. It is estimated that the capital expended in making the purchases was $60,000,000. The highest price paid for any single concern was $4,000,000 for the Atlantic White Lead Co. of Brooklyn.

The purchase of the placers in the Silver Bow basin, Alaska, is one of the most important transactions which has taken place in that Territory. The ground will now be worked on a large scale, for there is plenty of water and a good dumping-place.

The much-talked-of Newberry-Vautin process is to be put in practice in Grass Valley, an English company having been organized to operate the process there.

The Earthquake.

On Wednesday, at about 4:45 A. M., we experienced here the heaviest earthquake since the memorable one of 1868. One occurred May 19th which was quite sharp, but that of Wednesday was more severe, though it only lasted about 14 seconds. It was felt at Napa, Oakland, Benicia, San Leandro, Petaluma, Santa Cruz, Mt. Hamilton and elsewhere. No special damage was done, though a few buildings and chimneys were cracked. Prof. Geo. Davidson says: "At my residence, Hyde near California, the shock lasted 14 seconds. There was

Seismograph Tracing.

nearly at the middle of the oscillations a second shock. About 4h. 56m. there was a tremor of less than half a second's duration, up and down, and at 5h. 5m. a second tremor, slightly stronger, but of the same length.

"The main shock was east and west and gradually fell into oscillations running east-northeast and west-southwest.

"The amplitude of this earthquake shock is one-half greater than that of May 19th."

Astronomer Burckhalter of the Chabot Observatory, Oakland, in speaking of the shock said: "There is a great mistake as to the actual amount of movement of the earth in an earthquake. In the Chabot Observatory this morning the earth moved a little less than a quarter of an inch, and in East Oakland, where the shock was heavier, it moved about 5-16 of an inch. An earthquake in which the motion was a half-inch would prove very disastrous, and yet people do not hesitate to say that they saw the earth move at least a foot. This earthquake was by far the heaviest ever recorded at the Chabot Observatory. It was at least 50 per cent heavier than that of May 19th, and that had been the heaviest up to that time."

Prof. E. S. Holden, director of the Lick Observatory, says: "Mr. Keeler, in charge of the earthquake instrument, has just measured the intensity of the shock of this morning. It recorded that the shock occurred here at 4h. 46m. and 45s., and lasted for 30 seconds. The extreme motion was from north to south. It was equal to 2 100 of an inch, and the east and west motion was about the same. The vertical motion was very small. The period of the wave was about 3-10 of a second, and its intensity is estimated at five."

At the students' observatory at Berkeley the shock was registered as occurring at 4:47 o'clock in the morning and lasting 15 seconds. The vibration was from north of west to south of east. It was followed by three slight ones at short intervals. Prof. Frank Soule says that this was the most severe earthquake that he has experienced since he came to California in 1869. He classes it as sixth in the Rossi-Forel scale—that is, one that throws down chimneys and small articles.

Prof. Davidson expresses the opinion that the quake is in no way connected with the Japanese catastrophe, but is of local origin, very probably linked with the phenomena of subterranean activity at Susanville.

Mr. F. G. Blinn of Highland Park, East Oakland, has given us a tracing from his seismograph, which is reproduced herewith. The figure magnifies the motion four and eight-tenths times. According to his instrument, the actual motion of the earth was .53 of an inch—a little over half an inch. The center of the shock appears to have been near that locality; it was more severe in Fruitvale, to the eastward, where some chimneys were thrown down and glass broken. The shock was felt some seven seconds later in San Francisco than in East Oakland, and appears to have been lighter outside of the latter point.

Mr. Adley H. Cummins, a scientist, who has lectured several times before the California Academy of Sciences, was so startled by the earthquake shock that he died. Mr. Cummins had been suffering from heart disease.

Annual Expenditure on Claims.

EDITORS PRESS:—You will oblige me by publishing a statement as to whether a mining location, dated Jan. 1st, will hold one year or two without doing any assessment work required by the laws. N. D. S.

Mineral Park, Arizona.

The annual expenditure work, as far as the U. S. laws are concerned, is only necessary in the second, not the first, year. The law explicitly states: "On each claim located after May 10, 1872, and until a patent has been issued therefor, not less than $100 worth of labor shall be performed or improvements made during each year. *Provided*, That the period within which the work required to be done annually on all unpatented claims, so located, shall commence on the 1st day of January *succeeding* the date of location of such claims."

It may be remarked relative to the time when assessment work is to begin on a newly located claim that the Land Office holds that labor performed or money expended upon a mining claim *prior* to the 1st day of January *succeeding* the date of location will *not* be considered as a part of or applied upon the first annual expenditure required by law. Thus, upon a claim located at any time during 1889, the *period* within which the labor must be performed commences Jan. 1, 1890, and *during* the calendar year, 1890, the expenditure must be made, or the claim will be subject to relocation on and after Jan. 1, 1891.

The expenditures may be from surface or by tunnel. They may also be made by an agent and not the owner himself. It must be remembered, too, that a large expenditure in the past does not excuse the required *annual* expenditure.

Hoisting Cage.

The engraving on page 81 represents a modern hoisting cage, such as is used in the coal regions of the United States.

Upon two opposite sides of the pit are located the guide bars, which are usually constructed of hard wood. In order to provide against accidents in case of the rope breaking, the cage is provided with safety catches, the action of which is such that the instant the tension on the rope is released the quadrant racks shown at the side of the cage imbed themselves in the guides and the cage is arrested in its descent. This movement is effected by a series of rubber springs set in telescopic distance rings, through which the draw-head bolt passes, the whole being encased in the spring pocket shown underneath the draw beam. When the rope is in tension the draw-head bolt passes through and underneath the spring pocket and compresses the springs; but upon the release of the tension in the rope the springs push the draw-head bolt in toward the center of the cage, and thus act upon the levers connected with the quadrant catches.

Another arrangement contributing toward the safety of hoists is that known as *cage landing fans*. These consist of arms or prongs so arranged that the cage with its contents is landed upon them, where it is perfectly secure until the car is run on or off. The signal being given to lower, the fans are thrown back by means of a series of levers, and the cage is allowed to descend.

FOREST FIRES are blazing in all directions in Montana, in the mountains, and along the Missouri. The destruction to timber is immense, and it has been only through great exertions that many mills and hoisting works at the mines have been saved. Stage travel between many places is suspended.

SAN BERNARDINO COUNTY has the largest railroad mileage in the State, the assessed valuation being nearly $5,000,000.

The Stewart Mining Bill.

It will be remembered that at the last session of Congress Senator Stewart of Nevada introduced a bill amending the mining laws in several particulars. The bill passed the Senate May 24, 1888, and while pending in the House Committee on Mines and Mining it was extensively commented on by the press. In conformity with the suggestions offered, Senator Stewart re-drafted the bill, and after its examination and approval by Senator Teller he submitted it to the House Committee at a meeting held January 10, 1889. It was carefully considered by the committee, amended in one or two slight particulars, and its chairman authorized to report it to the House. The bill failed to become a law.

Among other things, provision was made that the date on which claims could be relocated, from failure to make annual expenditure, should be changed from Jan. 1st each year to Aug. 1st. each year.

Senator Stewart will re-introduce the bill the coming session, but the date referred to is to be changed to October 1st, instead of August. There are several provisions of importance in the new bill, and as Senator Stewart is desirous of obtaining practical suggestions from miners concerning them, we shall print the bill in full next week.

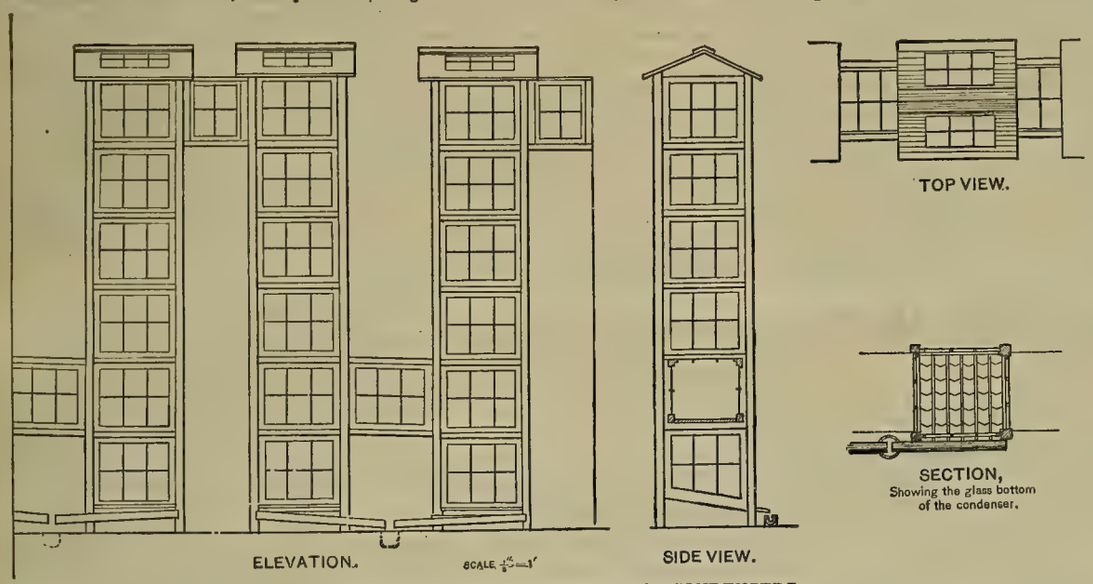
The Globe Ore Concentrator.

The principle upon which this works is that ore passed through a perfectly regulated air-blast, if presented often enough to the blast, will be concentrated; and to do this, there are used a blower, regulator, and condensing chamber. The concentrating chamber consists of a revolving cylinder which contains buckets and a spiral screw; the buckets lifting and dropping ore through the blast in a spray. The tendency of the spiral is to carry the ore up to the blast and out at that end of cylinder, but the blast, acting upon the ore, blows the lighter particles backward, and finally out of the rear end; while the heavy particles come forward in spite of the blast, and pour out of the other; thus there is a continual stream at each end of concentrations and gangue. The success of the machine lies largely with the regulator, which delivers a perfectly regulated current of air, according to adjustment. No regulation of blast has been attempted before, although there are machines which regulate the quantity, and the slightest change in speed of engine causes the air to come in puffs, which makes good work impossible. The quantity of ore which can be handled is governed entirely by difference in specific gravity between valuable matter and gangue, as with galena ores the company claims to be able to concentrate from 15 to 25 tons, and of the lightest iron sulphurets from 7 to 15 tons per day. The machine is made by a company in this city.

THE ATLAS IRON WORKS.—The Atlas Iron Company is building new works, between the Union Iron Works and the Pacific Rolling-Mills. Of the $1,000,000 capital stock, $100,000 has already been paid in. The company expects to build steam schooners, which are quite popular now on this coast.

THERE are now 40 stamps operated by steam crushing ore from south-end mines. This number will soon be increased to 50 by the addition of 10 more to the Justice mill. When the 50 are in full operation the monthly bullion yield from that part of the Comstock lode will be about $100,000.

CEMENT DEPOSIT.—John D. Spreckels is said to have offered $100,000 for the cement deposit recently discovered at Jamul, San Diego county. This cement stood a test of 459 pounds to the square inch, seven days old. It is estimated that the Jamul deposit will yield 300 barrels a day

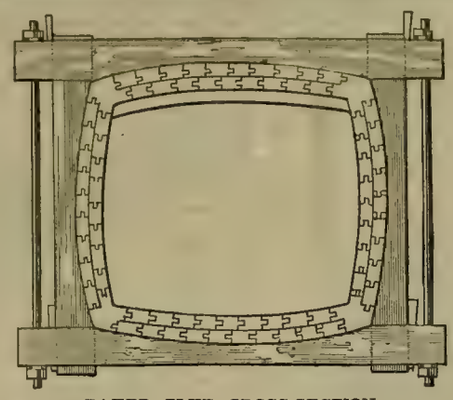


FAILURE OF THE SALT TRUST.—The North America Salt Company, erstwhile the salt trust, is unable to negotiate the $4,000,000 of bonds which it offered to the public, and the thousands expended in the formation of the trust are lost. The trust has been unable to corner salt.

ERRATA.—In the letter on Tuolumne mines, by "Argus" in the PRESS of July 20, page 42, "uniform masses of" should read "reniform" (kidney-shape). "Slating in places" should read "seating" (which is gneiss).

Quicksilver Condenser and Flues.

In his paper before the American Institute of Mining Engineers, Prof. S. B. Christy of the University of California describes the glass and wood condensers patented by Fiedler & Randol and used at the New Almaden mines. They replace heavy brick condensers in places where the temperature is low and acid waters plentiful. In their most approved form they are shown in the figure. As seen from the figures the top, bottom and sides of the condensers are constructed of sashes of ordinary window-glass set without putty. The woodwork of the structure is reduced to a minimum, and no nails or other metallic fastening are used in their construction. The bottoms, placed at a slight angle, are made of glass panes cut V-shaped at the lower ends and set like shingles on a roof; they drain all the condensed metal, water, etc., into a wooden gutter.



The general shape of the condenser as seen from the figures is that of a tall square prism (4½ feet by 4½ feet by 25 feet) surmounted by a glass roof. The condensers are connected with each other by flues of glass and wood similarly constructed. These flues join the condensers alternately at their tops and four feet above their bottoms. Consequently the fumes pass alternately up one condenser and down the next. In order that the condensed quicksilver globules may be removed as soon as possible from the action of the current, dead spaces are left at the bottom of each condenser into which such metal may settle. The condensers resist the acid waters very well and give very good results so long as they are kept in constant use, but when allowed to remain idle (during furnace stoppages) they dry and shrink, so when again used they at first leak and interfere with the draft of the furnace.

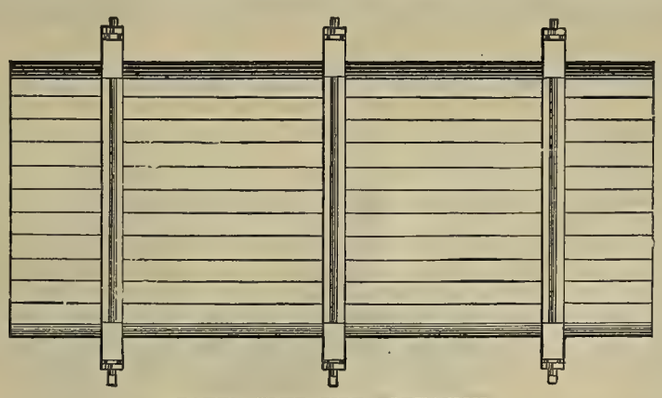
GLASS AND WOOD QUICKSILVER CONDENSERS.

After leaving the last condenser of each furnace system the fumes are conducted by wooden flues to brick towers, where they pass to flues up the hillsides. The Baker flue seems to be very successful, for it remains tight under alternate conditions of use and disuse. It is a nearly rectangular wooden tube, as shown in the cuts, though the sides are slightly cylindrical. The flue is made of two thicknesses of one-inch tongued and grooved redwood boards, laid so as to break joints, with a layer of asphaltum paper or felting between the joints. At intervals of six feet are placed square frames of 6x3-inch stuff, curved on the inside to grasp the sides of the flue, and arranged with wooden wedges for the side-frames and two tie-bolts for the top and bottom frames, so that the whole flue may be tightened by these means like a barrel.

These flues may be evidently built tight without the use of a nail, and, except the two tie-bolts which are exterior to the flue itself, without any metallic fastening whatever. They are wedged up close when they are dry, and when the moist fumes enter they swell perfectly tight. They are usually paved inside with a coat of hot asphaltum and coal-tar, and are painted outside. The two engravings show the Baker flue, except that as now built the corner timbers are left out, and the corners are made by the boards themselves, which are arranged to break joints.

BAKER FLUE—CROSS-SECTION.

Mining Statistics and the Census.



Mr. Porter, superintendent of the Eleventh Census, has placed the collection of the mining statistics in charge of Mr. David T. Day, chief of the Division of Mining Statistics and Technology, U. S. Geological Survey. No more competent or energetic man could have been selected. Mr. Day has for some years had charge of the "Mineral Resources of the United States," an annual volume issued by the Geological Survey, which is the most practical of the reports issued by the Government. It treats of all mineral and metallic substances except gold and silver, which are left to the Director of the Mint. If the statistics relating to them were also in the hands of Mr. Day, it would be better.

Mr. Day has had wide experience in the collection of statistics relating to mines and an excellent knowledge of the kind of information which is useful. He already has a small staff of assistants, but has always been hampered by lack of funds to carry out the work as he has desired. In the appointment he has just received he will no doubt be able to collect a vast amount of practical information which will be extremely valuable to all connected with the mining industry. Mr. Day visited this coast last summer, during which time the editors of the PRESS had an opportunity of forming his acquaintance. We feel assured that he will carry out his work with thoroughness and intelligence, and produce a report accurate, interesting and practical.

THE *Silver State* says: H. P. Bender has sold an antimony mine in Sacramento district, about eight miles east of Oreana, to an Eastern company. The vein is large and carries ore containing a high percentage of metal. There was estimated to be 160 tons of ore on the dump at the time of the sale.

AN injunction has been granted Herman Zadig in the District Court restraining R. F. Brodek from extracting ore from the Northern Belle No. 2 mining location in Devil's Gate District, Lyon county, Nev. Zadig claims that Brodek followed the ore vein into Northern Belle ground, and asks $5000 damages for that already extracted.

A MINING ditch at Canyon City, Trinity county, burst last week and did considerable damage to property in the neighborhood.

BAKER FLUE—SIDE ELEVATION.

To Work Low-Grade Ores.

Mining Operations in Amador County.

[Written for the PRESS by W. A. NEWCOM.]

The mining interests of California are at that point in their history which might safely be called the third era.

The first mining experience our State knew was conducted on the smallest scale by individuals whose chief mining implements were the "pan," "rocker" and "long tom." These men, in most cases, remained but a short time in a place, and after success or failure moved forward to better their fortunes, for the miners of those days were of a roving disposition, ambitious, dissatisfied, and filled with a desire to return with untold wealth to their Eastern homes, without remaining any length of time in the far West. They mined principally upon or near the surface in and around the mountain streams for auriferous gravel, and in the mountains where ledges cropped out and gold was easy and inexpensive to secure.

Later on comes the second era, during which local mining companies with limited capital were organized, and mining properties secured and developed as well as the capital and resources of the companies would allow. In many cases the mine-owners were afraid to invest extensively enough, with the result that the work was found unprofitable and abandoned to await the results of the advent of the third era.

Then comes the third era, which is marked by the diverting of idle Eastern and foreign capital, as well as local capital, from bank-vaults to the mining industries of our Golden State as a commercial enterprise. This era, where introduced, has enabled the erection of massive and substantial machinery, the sinking of deep shafts, and the cutting of extensive crosscuts and drifts, thereby opening up new and rich ledges and making it possible to work the low-grade ores which baffled smaller capital.

Our attention has recently been called to the Jackson mining district, around which clings so many memories of the pioneer and pioneer days in the first era of that great industry, which is now being developed by companies of almost unlimited capital.

The Jackson District.

The Jackson mining district in Amador county includes those mines in the immediate vicinity of Jackson. Of these mines the Zeile, Kennedy, and Amador gold mine are being worked most extensively. These mines are upon the great mother lode of California, which is known to extend about 100 miles along the western foothills of the Sierra Nevada mountains, through Mariposa, Tuolumne, Calaveras, Amador, and El Dorado counties, at an elevation of from 1000 to 2000 feet above the sea level. This formation through which this lode runs is from 400 feet to two miles wide, in which are a number of separate and distinct quartz ledges or veins dipping to the east at an angle of from 45 to 70 degrees, all of the same general character, which are mined and milled with great profit wherever worked on a large scale, or in proportion to the size of the lode. The hanging-wall is greenstone and the foot-wall, black slate. The foreign matter between the ledges or veins is generally slate, but sometimes is composed of greenstone.

The Kennedy was purchased by the present company about three years ago, in which time they have opened thoroughly a mine that had been idle for ten years, erected a 40-stamp mill, hoisting works, and other improvements, and put down the main shaft 300 feet deeper, and extended their levels. The Kennedy has paid very well while these improvements were going on, and now that everything is working very smoothly under the able management of Mr. J. F. Parks, one of the best gold-miners in California, the mine is, of course, expected to turn out large dividends.

The Zeile may be considered the "Old Reliable," as it has steadily run for about ten years, crushing with a 40-stamp mill 50,000 tons of ore yearly. They have their own chlorination works, and are able to work the ore very cheaply, and make a profit on a grade of ore that under unfavorable circumstances would have to be thrown over the dump. The superintendent of this company deserves the credit, and gets it, too, of being one of the best mining managers in the State.

The owners of most of the other mines are at present engaged in trying to secure foreign capital to develop their mining properties, or else have secured the same and are preparing to turn out the precious metal.

The Amador Gold Mine, Limited, of London.

The Amador gold mine is interesting as a mining proposition, because it represents the largest introduction of foreign capital in the district, and from the fact that the mill and hoist are among the best in California, and because it is a proposed candidate for dividend honors; for these reasons we note particularly the operations of this company.

The company owns about 90 acres of patented land all fenced and cross-fenced with five barbed wires.

This mine, which has for three years, under the management of the same superintendent,

been developing its property, recently came into the hands of men of immense financial resources whose headquarters are in London, England. They are going to continue the work so ably begun and carried on during the last three years by an American company, and will have both mill and mine at work to their greatest capacity inside of two months.

The mining structures erected upon the property are so magnificent and upon such a grand scale, so substantial in their every particular, that a description will be of interest to all quartz miners.

The Mine.

Three years ago, when the gentleman who is still superintendent and manager took hold of this property, the only improvements were a shaft 90 feet deep on the west side of the gulch, and two, one 40 feet and the other 45 feet deep, on the east side. They went to work with a determination to thoroughly explore the property and ascertain its wealth. To that end they sunk the north shaft, on the east side of the gulch, at an angle of about 71 degrees, 280 feet; at 250 feet deep a station was made, and increased the size of the south shaft to three compartments, one for the pump and two for the skips, and sunk it 583 feet, making a station at every 100 feet below the 250-foot level. The stations and chutes are large and convenient. The ore and waste is handled cheaply. The skips are loaded by ratchet chutes and discharge automatically—the waste into a bin and the ore on to grizzlies which separate the ore into fine and coarse, the fine going into the ore bin and the coarse into the 25,000-pound Gates crusher, then into the ore bin. On the 250-foot level a drift of 283 feet connects the stations at the north and south shafts, while one runs about 360 feet north from the north shaft, or shaft No. 1; from the west of this drift two rises have been carried up about 45 feet each; a crosscut is run east 100 feet, cutting a 20-foot ledge. From the drift connecting the two stations a crosscut runs west 450 feet through two ledges, one 15 feet, the other 20 feet, to and connecting with the west shaft, or shaft No. 2, thereby giving a free circulation of air throughout the entire 250-foot level; from this crosscut a drift was run 250 feet north and 150 feet south on the second west ledge. From the station at the south shaft, or shaft No. 3, a drift runs south, and several crosscuts, one of 560 feet, run to the east and middle ledges.

At the 350-foot station a crosscut has been run east 72 feet, passing through and beyond the middle ledge, which is 15 feet wide.

At the 450-foot station a crosscut runs 70 feet through the same ledge. A drift runs north 80 feet, and another south 10 feet on the same ledge. From the station west a crosscut runs 146 feet, passing through the first west ledge, which is 15 feet wide.

To perform this work, temporary hoisting apparatus with buckets were employed at each shaft. That at shaft No. 1 is still standing and in use, while that at shaft No. 3 has given way to the new hoist herein described.

This immense amount of underground work, requiring much time and thousands of money, has laid bare the quartz veins in many places, and when the great machinery of the concern is put in motion, rock will be plentiful and the bullion returns satisfactory. The mine is getting in excellent shape for handling great quantities of ore.

The Hoisting Works.

The hoisting works are a magnificent and substantial structure erected upon the east side of the ravine upon the company's property. It consists of a building 40 feet by 130 feet and 75 feet high. This building is framed with heavy timbers, well bolted, and is built upon a secure foundation of masonry consisting of four dwarf walls varying from two to four feet in thickness. It contains the air-compressors, the rock-breaker, the pump, the gallows-frame and the hoisting machinery.

The air-compressor is propelled by a four-foot Pelton wheel and is most perfect in design, having an automatic cut-off which, by its ingenious arrangement, so regulates the compressing engine that it always keeps the chamber at the pressure for which it is set. The air runs the drills and a small engine in shaft No. 2 at the 250-foot level and assists in furnishing air for the mine.

The hoisting works at shaft No. 1 gets its power from a four-foot Donnelly wheel. The hoisting gear is of the friction pattern and is good of its kind. It has done a great deal of work while the underground developments have been going on.

The Gates rock-breaker, which weighs 25,000 pounds, and has a capacity of 300 tons in ten hours, is comparatively new to this coast. It sets back of the gallows-frame and is run by a four-foot Pelton wheel. The breaker is round, with a cone inside which revolves with a wobbling motion caused by the cone being geared out of center. This gives a continuous breaking surface and reduces the rock to a size that will pass through a three-fourths of an inch ring. It is undoubtedly the largest rock-breaker in the county.

The pump, pump gear, pump bob, connecting rod, counter-shafts and other necessary machinery connected therewith make up one of as good work as was ever turned out of a foundry. The foundations for the gear, bob and counter-shaft are of solid masonry, into which they are anchored by bolts ten feet long, which, at the lower end, are eyed into heavy railroad iron, thus giving a secure foundation, which in turn will give a most steady and powerful stroke. This pump-gear is V-shaped and is capable of either a three, four, five or six foot stroke. The pump is an eight-inch Cornish plunger which is stationed at the 250-foot level. A six-inch pump raises water from the bottom of the mine to the 250-foot level.

The gallows-frame rests upon a 14 by 16 inch sill, which is bolted to the bottom of the wall of masonry upon which it stands, and is 40 feet high, 30 feet wide, and 19 feet deep on the floor, and is 10 by 19 feet at the top. It is substantially made, being composed of strong timbers 14 by 16 inches, with cross and side girths 10 by 12 inches and braces 8 by 10 inches, caps 14 by 16 inches and gallows 12 by 16 inches, all mortised and heavily bolted. In the top are fixed the two sheaves, seven feet in diameter, over which runs the 1⅛ inch steel-wire rope from the hoist to the mine. Sheaves move in their boxes as the rope winds across the face of the reel.

The hoisting machinery is of the latest pattern, V-geared, with two hoist reels each seven feet in diameter and is supplied with a Belshaw cut-off, post brakes for the reel and a foot-brake for the fly-wheel. This machine has indicators which show the position of the skips in the mine and indicators which show the opening and shutting of the six nozzles. Its capacity is 1000 tons a day.

The mine and mill are located about a half mile apart with a difference of altitude of about 250 feet, which incline of the tramway will produce momentum enough upon a loaded car going from the mine to the mill to haul the empty car back from the mill to the mine; at most, the only power required will be accomplished by two four-foot water-wheels and a single reversible reel with clutches, brakes, etc.

The Mill.

The mill belonging to this company, as has been heretofore stated, is located down the mountain half a mile at an altitude of about 250 feet less than the mine, thus making possible to practice the great economy of using the water for power that has once been used at the numerous machines at the mine. The mill is erected upon a solid foundation. A glance at its immense timbers, retaining walls, size and plan of the battery shows one its great stability and solidity. The building itself is one 108 feet long, 90 feet wide and 75 feet high, and is strongly built, the frame being made of 2 by 8 inch and 3 by 8 inch pine timbers with 2 inch packing-blocks thoroughly bolted. The truss cords are 3 by 10 inches with the rafters and purlines 3 by 8 inches all securely bolted.

On the upper side of this building is the ore-bin, over which the cars from the tramway run and automatically dump their loads. This bin is 80 feet long, 15 feet wide, and 14 feet deep, double lined with two-inch planks, and securely bolted sideways with 1½-inch iron rods. Near the bottom of this bin are doors opening into the chutes under which the Hendy feeders stand upon the upper battery floor. Upon this floor and the floor below ranging the full length, stand 12 batteries of five stamps each, or 60 stamps; each weighs 850 pounds. Each 20 stamps or four batteries run independently. These batteries are of the latest pattern and are supplied with a blind screen for convenience in repairing and cleaning. The floors of the mill are especially well built for strength and durability, yet the battery frame, to secure solidity, strength and durability, is built entirely independent of the rest of the house, and the mortar bed is made of timbers 14 feet long, 5 feet wide and two feet four inches thick, stood on end in solid rock with foundation of masonry. The single battery timbers are 12 by 24 inches, and those for the double battery are 20 by 24 inches; the knee beams, knee posts, and the guide girths are 12 by 16 inches; the battery braces are 8 by 12 inches; and the knee cords are 16 by 16 inches, all mortised and tenoned, and securely bolted with heavy and strong Norway iron bolts. The Line shaft for this machinery is six inches at the power end, and diminishes to 4½ inches, while the cam shaft has a diameter of seven inches. This battery is run by a six-foot Pelton wheel. The 24 Frue concentrators are run by a three-foot Pelton wheel.

On the lower battery floor also stand 12 aprons lined with the best copper plate. This plate is covered with quicksilver, and as the pulp passes from the stamps, the free gold is amalgamated and held there while the remainder containing the sulphurets passes through the sluices to the vanner-room on the floor below and over the 24 improved Frue concentrators by which all the valuable sulphurets are collected in tanks. We note the unusually large copper plate surface. The two driving shafts of the concentrator are two inches in diameter. The amalgam and the sulphurets, after being collected, are removed to the retort-room or to the dry-house and chlorination works as the case may be.

The Power.

The system of supplying power for the works at the mine and mill is excellent. Near the top of the hill, on the west side of Hunt's ravine, is located the first reservoir of the mine, which is supplied with water by the Amador Ditch Co. This reservoir supplies three pipelines to the mine machinery, consisting of one hoisting works at the north shaft, one hoisting works at the south shaft, one sample, one stamp-mill, one six-inch pump, one eight-inch pump, one mine-blower, two blacksmith's blowers, one Gates crusher, one compressor, and pipes to all buildings for fire purposes. An 11-inch pipe furnishes water for the four-foot Pelton wheel of the compressor and for the 10-inch wheel which runs the blower in the blacksmith shop. Another line about the same size supplies the hoisting works and pump at shaft No. 1. The main pipe-line which supplies the large Pelton wheels for the hoist, the pump and the rock-breaker is of 22-inch steel pipe strongly made and carefully laid. These pipelines are about 900 feet long and have a fall of 160 feet from the reservoir, giving plenty of power to run the machinery. After the water is used at the hoisting works it is collected in a reservoir near by and carried in a ditch of ample capacity to a large reservoir upon the hill above the mill. This ditch follows the hillside around 3500 feet, with a fall of one-quarter of an inch to the rod, to the mill reservoir, which is 10 feet deep, 100 feet wide, and 250 feet long. From the reservoir an 18-inch steel pipe-line is carried 800 feet to the mill to furnish power for the batteries, concentrators, and cleanup pans; and a branch six inch pipe to run the electric plant for lighting the mill, after which the water goes into the two 10,000 gallon tanks.

As interesting facts, it may be noted that the company has made ample precautions in case of fire. They carry over $50,000 insurance on the works. They have laid over 14,000 feet of pipe of different sizes, and have an immense stock of tools and supplies of all kinds. There is over 600,000 feet of lumber in the different works.

Sample-Mill.

One of the very important, and in fact an indispensable part of the equipment of the mine, is the sample-mill, which is located in a house 16 by 26 feet, with three floors. On the upper floor is a small Gates crusher; the next is the battery floor, where a single stamp of 750 pounds is kept at work; the lower floor is fitted up with copper plates and sample kegs for the sulphurets.

Blacksmith-Shop.

Another of the important equipments is the blacksmith-shop, 30 by 40 feet. The shop has two circular iron forges, one for the heavy work and one for the tool-sharpening. The heavy forge is supplied with a hanging crane, and the entire shop is furnished with a full assortment of necessary tools for all kinds of general work, and skip and car-building. All the ironwork used in the construction, except castings, has been made in this shop, while the mining tools, skips and cars turned out are models of perfection.

Investment and Returns.

Already a quarter of a million dollars have been invested in improving this property during the three years, and it will take $50,000 more to put it in such condition that they will be able to work both mill and mine to their fullest capacity.

The surface of this mining property is such that ample convenience is secured for building sites, lumber-yards and dumps, and the six ledges on the property are easy of access, in fact heavy teams can drive almost to the mouths of the shafts.

The character of the work all through the mine is such that the expense and delay for repairs will be very small. The almost inexhaustible supply of ore exposed, all ready to extract, insures constant employment for the 60 stamps.

This investment will yield a good return. Enough pay-rock has been uncovered to keep both mine and mill steadily at work to their fullest capacity for years. The proximity of this ore to the surface makes it comparatively cheap to take from the mine, and the economy practiced in utilizing the water for power will make it possible to reduce the ore for $2 a ton, this including every expense. This mine makes its estimates and places its dependence upon the low-grade ores, which assay about $4 to $6 a ton, though they have some ore which will run much higher. Their machinery will work up 200 tons per day. It can be readily seen that the net profit, working $5 ore, should be $216,000 a year.

ACADEMY OF SCIENCES.—The California Academy of Sciences has applied to the Superior Court for the right to mortgage its premises on Market street, near Fourth, where the new building is now being erected, for $400,000. The reason for this application is that the money is needed to complete the building, and the society cannot now get the $400,000 legacy left it by the late James Lick, because it is in litigation, and the trustees refuse to pay it over without taking a mortgage on the whole property, so as to secure themselves against any possible adverse construction of the section in Mr. Lick's will that sets forth the bequest. The Trustees of the society apologize for the necessity of the loan by saying that they had no idea when they commenced the building that there would be any doubt about getting the money as soon as needed.

REBUILDING SMELTERS.—The work of rebuilding the smelters of the Eureka Consolidated M. Co. at Eureka Nev., has commenced. The short delay since their destruction by fire was occasioned by a difficulty in arranging for the necessary quantity of building materials. This will all be shipped from San Francisco. A large shipment of silver bullion has just been made and another of lead left on Monday. This was saved with the refinery, the only building which escaped destruction at the time of the fire.

ALFRED POETT of Santa Barbara has been engaged as consulting engineer of the Nicaragua Canal.

The Northern Counties of California.

NUMBER 8.

Mineral Products of Economic Value.

[Written for the PRESS by JAMES H. CROSSMAN.]

The northern tier of counties in this State are not deficient in veins and deposits of base metal ores. Iron, copper, mercury, chrome, manganese, antimony, etc., abound, as well as nearly all of the minerals that are used in the arts. Coal, petroleum, asphaltum, coal oil, illuminating gas, building stones of many varieties, and of superior quality, lime, cement, gypsum, sodas, and alkaline earths for chemical and industrial purposes occur in different localities. There are also innumerable springs of medicated mineral waters, both hot and cold.

Mineral Springs.

The celebrated mud springs on Mud creek, a tributary of the McCloud river, in the southern portion of Siskiyou county, are rapidly acquiring a deserved reputation for their almost miraculous cures of chronic skin diseases, blood poisons, rheumatic and gouty affections. Dr. Winslow Anderson, Professor of Chemistry, recently read an able treatise on the "Natural Mineral Waters of our State," before the Medical Society of California. In closing, he said: "I do not hesitate in predicting the evolution of California into one of the world's sanitariums."

There is no portion of the American continent that contains a greater variety of mineral springs, both hot and cold, than the region under consideration. These aqueous products, manufactured in Nature's laboratory by Nature's chemist, under the all-powerful influences of subterranean dynamic forces and chemical action, contain medicinal and curative properties that alleviate, if not cure, most of the ills that human flesh is heir to. Why should our invalids, when they so much require rest, visit Europe for medical treatment when they have at our very doors medicinal springs that show by analytical tests the same mineral formulæ as those that they visit in distant lands?

For the architect and builder, this region contains unlimited quantities of all the rocky formations that are essential for the construction of our habitations, palaces, hotels, public buildings, pavements and monumental structures for both the living and the dead.

A Map Needed.

When a detailed topographical, geological and mineralogical survey and a map with an explanatory text-book shall have been made, the illimitable resources of not only this region but of all California will be better understood.

The map should show in detail the watershed, contour lines, river gradients, elevations, reservoir sites, arid, swamp and overflowed lands, timber lands, formations, stratigraphical and mineralogical features, defining the mineral belts as well as the dead-river system of Pliocene channels. The accompanying report or text-book should give accurate data as to the rivers' maximum and minimum grade and flow, depth, velocity of stream, precipitation at the several points, temperature—maximum, minimum and the mean. The soils of the several localities should be analyzed in order that the agriculturist may select that section which is best adapted to his pursuit. The waters from the several mineral springs should have careful analytical tests. The text-book should show all of this and as much more as would come within the province of the survey.

The Mining Bureau.

Our State Mineralogist, Wm. Irelan Jr., is eminently qualified to fill the position as chief of this department. His able administration of the affairs of the California State Mining Bureau during the past fiscal year; the immense amount of work accomplished by him with an insufficient appropriation and a small corps of field and laboratory assistants, was evidently realized and appreciated by our State Legislature, as at the last session a bill was introduced appropriating $100,000 to the Bureau. It was given with the distinct understanding that seven-tenths of this amount should be expended in inaugurating and prosecuting a State Geological Survey as herein outlined and presented. The bill passed both houses, was signed by the Governor and became a law; but through some technical error in its copying the money is not as yet available. Therefore this important work has not as yet been commenced.

Much has been done heretofore by both State and U. S. engineers in furtherance of this object, but for want of time and necessary funds, the main issues have been neglected. No detailed map has been completed. In fact, there has been nothing more accomplished than a topographical survey in part of our State of which portions have been triangulated from base lines to prominent points, with details of intermediate mineralogical and geological features unascertained if we can judge from a communication in a recent issue of your paper signed by Geo. F. Becker, U. S. Geologist in charge. In that he asks for information from readers, miners, school-teachers, etc., as to fossils that may enable him to complete a satisfactory map of the Gold Belt of California, which important points he should have ascertained long ere this from his assistants in the field.

Judging from the article referred to, the completion of the United States survey and map is

in the dim distant future. So far as the work has progressed, it is of no immediate practical benefit to any one.

What we require is a prompt, thorough, and careful survey of our State by our State engineers, with map and text-book. When this shall have been completed and the Oregon and California system of branches as feeders for the main trunk line shall have been extended, this hitherto isolated region will be rapidly developed and its mineral and agricultural products add largely to the general prosperity of our State and nation. It is useless to wait for the slow and red-tape movements of our United States engineers. Of the several northern counties of our State, we have valuable and accurate county maps, but nothing touching on the topography, geology, or mineralogy of the region. The map of Siskiyou county by I. M. Davidson, Deputy U. S. Mineral and County Surveyor, is especially deserving of note. Surveyor Davidson possesses a fund of information relating to the rocky formation through and over which he has run his lines. This information he cheerfully imparts, and, undoubtedly, could assist Mr. Becker in pointing out fossiliferous beds or stratigraphical features that Major Powell's engineers in the field have no knowledge of. Whenever Comptroller Dunn audits the bill of our State Mineralogist under the appropriation made by our State Legislature, the work of the survey will commence with a competent corps of both field and laboratory assistants. In the laboratory, analytical tests of waters and earths will be made, the tensile strength of building stones ascertained, and assays of ores made.

Siskiyou County Springs.

In Siskiyou county, at a point 3½ miles northeast of Dunsmuir, near the sixteenth crossing of the Oregon & California railroad, 20 miles from Mount Shasta, we enter the mineral-spring belt or region of mineral waters. I will briefly describe a few of the springs as a type of the many.

Spring No. 1—Water cold; flow 4 inches, miner's measurement; acidulated and ferruginous, containing iron and carbonic acid gas; said to be good for the kidneys and other diseases incidental to this organ, indigestion, etc. This spring issues between contacts of basaltic lava and tufa which is underlaid by trap. No analysis.

No. 2 comprises quite a number of springs of the same character, all within an area of 500 or 600 feet. Its minerals are sulphur and iron; no analysis.

No. 3 is Steamboat or Furlong's spring on Hedge creek; elevation 2700 feet; effervescent and sparkling; evolves carbonic acid gas in such quantities that it can only be inhaled for a moment, and kills insects that approach or fly over it, as well as small animals that approach the pool. It is said to be efficacious in kidney diseases and nervous affections, and takes its name from the blowing or puffing noise that is heard for a considerable distance as the gas escapes. The waters are used by the inhabitants who reside in the vicinity in place of yeast to raise their bread. No analytical test.

No. 4—Bilicky soda springs. Water effervescent and sparkling; flow light; taste pleasant, slightly acidulated. With sugar, makes a pleasant lemonade.

In Modoc county there are large areas of hot as well as cold springs, having medicinal properties. With the medicated springs of Humboldt, Mendocino and Del Norte counties I have no personal knowledge.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

LAST Saturday evening 330 men were discharged from the Southern Pacific's shops at Sacramento, 160 of whom were skilled mechanics.

THE INDIANS in the United States who can read Indian languages number 10,027, and 23,498 can read English.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

For Sale Cheap—2 Steam Engines,

Union Iron Works make, 12x24 Cylinder, Myers Cut-off, one 10x16 Cylinder, plain Slide Valve. In good condition. For Sale at the

Rates $1 $1.25 and $1.50 Per Day; Free Coach.

The above Hotel is situated in the midst of the Banking and Commercial Houses of the city, and is by far the most home-like and desirable Hotel to stop at.
CHAS. & WM. MONTGOMERY, Prop'rs.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft.; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

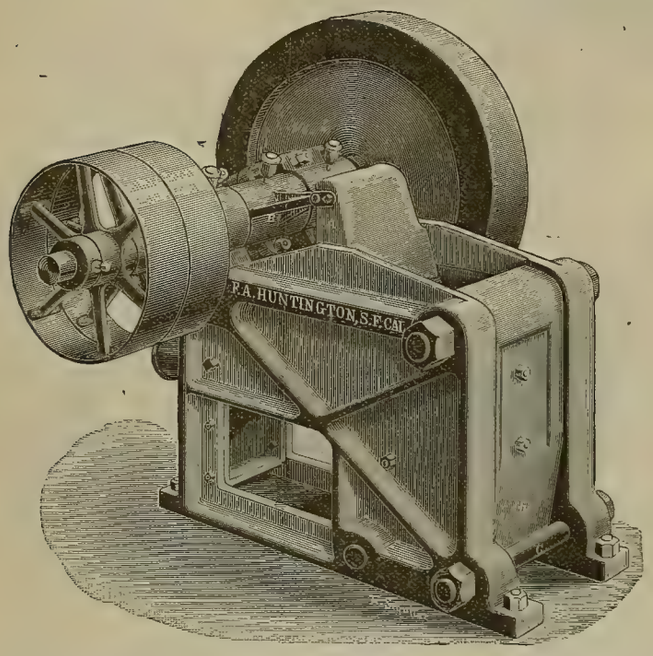
611 & 613 Front St., San Francisco, Cal.

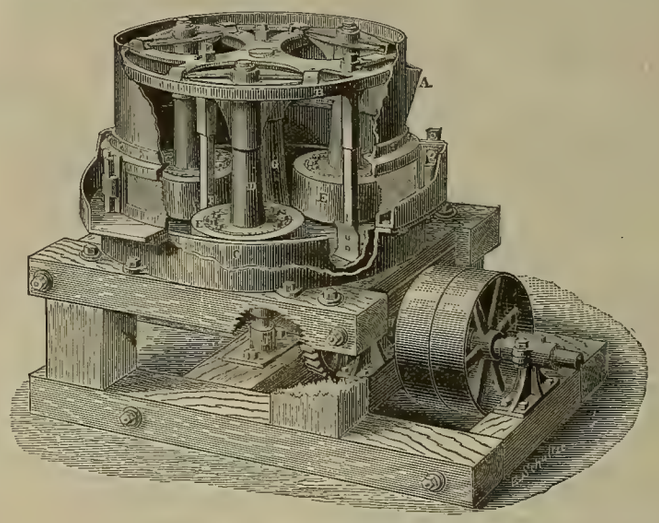


Smelter For Sale or Exchange.
One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

CITY HOTEL.

Sonora, - - - - - - Tuolumne Co., Cal.

HEADQUARTERS FOR MINING AND TRAVELING MEN.

Office of all Stage Lines leading out of Sonora. Fine Bar, Billiard, Reading and Sample Rooms. Everything first-class. Terms reasonable. C. S. FITCH, Proprietor.

Mining Personals.

C. E. Cahn, from the Columbus borax works, Nev., is visiting the city.

CAPTAIN JOHN KELLY, Supt. of the Bodie mine, is on a visit to San Francisco.

W. S. Godbe, general manager of the Pioche Con. & Yuba M. Co., Nev., is visiting Salt Lake City.

L. M. Warden, the president of the Bituminous Rock Co., at San Luis Obispo, is in San Francisco.

Phil Nichols, formerly of Colfax, is superintendent of the Fall Creek placer, San Miguel, Colorado.

John B. Davidson and George Anderson, both panmen at Pinos Altos, Mexico, have returned to California.

W. C. Price, superintendent of the North Belle Isle and Navajo mines, Tuscarora, Nev., has come "down to the bay."

J. M. Harper, one of the gentlemen from New York who are going to bond the Mountain mine, Sierra county, is in Sierra City.

Wm. Jones, formerly of Gold Run, Placer Co., is superintendent of the Great Arkansas Mining Company at Texas Creek, Colorado.

A. W. Havens, Joseph Marks and Geo. R. Wells of this city have been inspecting the new mill of the Occidental mine on the Comstock.

John German of North San Juan, Nevada county, was at Downieville, Sierra Co., last week, inspecting his valuable drift mine below the Mt. House.

E. B. C. Hambly, a mining engineer of Rockwell, N. C., has recently been examining the Cleveland mine, above Big Bar Bridge, Amador county.

J. B. Randol, the general manager of the New Almaden quicksilver mine, is one of the projectors of the proposed Twelfth-street line of cable cars in Oakland.

Mr. Madden, formerly superintendent of the Nevada Ditch and Reservoir Company, is general manager of several English companies operating on the San Miguel river, Colorado.

Mr. A. C. Dubois, the author of several interesting articles in the MINING AND SCIENTIFIC PRESS, on "Mexican Mines and Miners," is now assayer at the Pinos Altos mine, Mexico.

James Pierce, formerly underground foreman of the New Almaden quicksilver mines, lost his life at Triumpho, Lower California, July 12th, in endeavoring to rescue five miners who were cut off by fire in Argimarra silver mine.

R. P. Keating, superintendent of the Savage mine, G. Kerwin, superintendent of the Best and Belcher, J. Thomas, foreman of the Crown Point, and J. Conner, assayer of the Chollar mine, have been visiting the mines in Tuscarora district, Nev.

Col. R. F. Looney of Memphis, Tenn., and Judge R. E. Reese of St. Louis, Mo., have just left Baker City, Oregon, after having purchased the Baisley mine, about six miles west of that place. The price paid is said to have been $200,000. This is the largest mining sale Oregon has experienced.

Mr. A. E. Roberts, who has been for a year past assayer at the Pinos Altos mine, Mexico, is again in San Francisco. At one time Mr. Roberts spent a year in gold mines in China which are being worked by the Government, and unless he finds more congenial employment here may return to that country.

Mr. C. H. Aaron left this week to take charge, for an Eastern company, of the Santa Lucia mills, which is about nine miles from Tegucigalpa, Honduras. He will look into the feasibility of leaching the ore. The mill now has ten stamps, but it is in contemplation to enlarge it. This is Mr. Aaron's second visit to the mines of Honduras.

Mr. C. A. Stetefeldt, the inventor of the Stetefeldt furnace, and author of "The Lixiviation of Silver Ores with Hyposulphite Solutions," has left New York to take up his residence in San Francisco. Mr. Stetefeldt is one of our best-known mining engineers and metallurgists, and was for many years occupied on this coast. For the past few years he has been living in New York.

Mr. E. W. Peet, who 20 years ago was mining in San Diego county with one of the editors of the PRESS, was in the city this week. He is operating the Whittle gold mine at Angels camp, Calaveras county. Mr. Peet says the shaft is down 200 feet and two levels have been run. The ledge runs $10 to $12 per ton, though some rock has paid $25. The mine has paid expenses with a small Huntington mill. The ledge is widening and prospects improving.

F. C. Poisson, who was formerly with the Odessa Mining Company of this State, has recently returned to San Francisco from Johannesburg, in the Transvaal, South Africa. He states that the discoveries of gold there have caused a growth in the surrounding country equal to the old-time mining growths on the Pacific Coast. The ledges carry gold ore, and it is worked by stamps. There are 180 companies, running 450 stamps, and 1500 more stamps are in course of erection. In May last the yield for the month was $648,000. These are known as the Winwatersrandt gold-fields. It costs $7 per ton to mine and mill the ore, which will average $10, though some runs much higher.

Theophilus Masac, president of the Lower California Mining Company controlling the Masac mining concession in the Real del Castillo district, is in this city. The concession covers 115 square miles of mining lands, in which tract the company owns 30 mines, both placer and quartz. After many futile efforts to obtain white or native laborers for the mines, the company was compelled to look elsewhere than in Lower California for experienced miners. Owing to these circumstances Mr. Masac was enabled to make a contract with several Chinese firms and companies, by virtue of which the mining properties of this company are now being opened up. The name of the Chinese corporation which has taken hold of these concessions is the On Yick Co. This company has unlimited capital to prosecute both enterprises. About 600 miners will be employed.

The Astronomical Society.

The Astronomical Society of the Pacific met at the Lick Observatory, Mount Hamilton, last Saturday. It was announced that the report of the solar eclipse of last January, now being printed by order of the Regents of the University, has reached page 603, about a third of the volume. It contains reports from more than 150 persons, distributed at 25 different observing stations.

C. F. Crocker has offered to bear the expense of an expedition from the Lick Observatory to Cayenne, South America, next December, and it is expected at that time to confirm and extend some of the discoveries made at the last eclipse.

Hon. Joseph A. Donahoe of Menlo Park has offered the Astronomical Society of the Pacific to establish a medal to be given to the first discoverer of every unexpected comet, and to the first person making a precise observation of a telescopic periodic comet at any one of its expected returns. This medal is intended solely as a recognition of merit and to commemorate the discovery, and is not designed in any sense as a reward. Mr. Donohoe also offered the gift of a fund sufficient to maintain such a medal in perpetuity from and after January 1, 1890. The society has gratefully accepted the offer.

No application for the award of the medal is required. It will be given as a matter of course to the acknowledged discoverer of each new comet. It is, however, prescribed that a letter should be addressed to the director of the Lick Observatory, which communication must contain all the particulars of the first observation.

The full conditions on which the awards will be made will shortly be printed in the various scientific journals and in the publications of the Astronomical Society of the Pacific, where they can be found by those interested.

There were too many papers presented to allow all of them to be read; and accordingly, some were postponed till the next meeting. The papers read, either by title or in full, were: "The Possibility of Photographing the Corona in Full Sunshine," by Mr. Kuler; "The Orbit of Comet Barnard, June 23d," by Mr. Leuschner; "The Occultations of Jupiter to be Expected in 1889," by Mr. Hill; on "A Photograph of the Milky Way near Jupiter, Taken the 29th inst., with 1 hour and 48 Minutes Exposure," by Mr. Barnard. Another paper was: "The Real Shape of the Nebula, Which we see as a Spiral," by Mr. Holden.

The following persons were elected to active or life membership at the meeting: Ex-United States Senator James G. Fair, Mr. Robert D. Fry, Mr. Rudolph E. Voight, Mr. I. P. Belknap, Mrs. William Alvord, Mr. Alexander Montgomery, Mrs. Alexander Montgomery, Mr. John Partridge, Dr. Geo. C. Pardee, Miss Fidelia M. Jewett, Miss L. J. Martin, Mr. Lester L. Robinson, Mr. Andrew R. Forbes, Mr. John R. Spring, Judge John H. Boalt, Mr. Robert H. White, Mr. Horace L. Hill, Mr. Joseph G. Lavery, Dr. W. B. Lewitt, Dr. L. L. Dunbar, Mr. Charles Webb Howard, Mr. James Perry, Jr., Dr. W. J. Sullivan, Mr. Darius Ogden Mills, Captain Charles Goodall, Mr. Adam Grant, Mr. James D. Grant, Albert Raymond, Lawrence V. Pierson, T. W. Fenn, Rev. Robert McKenzie, Hon. James M. Getchell, J. C. L. Wadsworth, Mr. Arthur W. Foster, all of San Francisco; Hon. Alf L. Tubbs, Mr. J. W. McClymond, Mr. Charles G. Yale, Mr. George H. Strong, ex-Governor George C. Perkins, Mr. John C. Billock of Oakland, Cal., Mr. Charles R. Tisdall, Alameda, Cal., Mr. Charles W. Friend, Carson City, Nev., Mr. C. H. Clement of Livermore, Cal., United States Senator John P. Jones of Nevada, Mr. Henry V. Alvord, San Jose, Cal., J. Senor Felijee Valle, Senor Manuel G. Prieta, Director Angel Auguino, Fedona Quintino Camitto Gonzales, Francisco Rodriquez Rey of the National Observatory at Taculay, Mexico.

After the adjournment of the society the members looked at the various objects of interest shown by the astronomers of the observatory. In this society the annual dues are $5 and there is no initiation fee. A life membership is $50. The publications are sent to every member, and three of its six meetings are held in San Francisco.

COTTON-MILLS AT THE SOUTH are constantly being multiplied. It is said that the State of Georgia alone has 55 cotton-mills, and that the city of Augusta contains 13 cotton manufacturing plants, which represent $5,500,000 of capital. It is the opinion of the *Manufacturers' Record* that the present year will be the greatest thus far in the development of the industries of the South.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in DEWEY & CO.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JULY 23, 1889.

407,463.—ROTARY HARROW—Ansley & Boyd, Medical Lake, W. T.

407,511.—THRASHER ATTACHMENT—J. D. Burkhart, Dayton, W. T.

407,343.—BULLET MACHINE—L. P. Garcin, S. F.

407,542.—GRAIN SEPARATOR—A. Mecklem, Colfax, W. T.

407,559.—HOOP CLAMP—Asa G. Wells, S. F.

407,389.—CABLE R. R. SIGNAL CROSSING—R. H. Wright, S. F.

The following brief list by telegraph, for July 31st, will appear more complete on receipt of mail advices:

California.—William F. Toothaker, San Francisco, hydraulic elevator; John Rosasco, Healdsburg, assignor of half to John Cuneo, San Francisco, fruit-pitting machine; Hugo Roensch, assignor to A. Schilling, San Francisco, paper box; John Comer, assignor of three-fourths to H. Berger and E. Aldersley of Anderson, and F. H. Darin of Redding, lubricator for shaft bearings; Wm. M. Brown, Jr., Sacramento, pipe coupling; Wm. C. D. Body, Grass Valley, safety clutch for cars on inclined railway.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Results of Injunctions.

EDITORS PRESS:—At the Dutch Hill mine, Savercool Brothers showed your correspondent works said to have cost $750,000, but now in a state of ruin owing to injunctions. Forty acres have been washed and there is plenty more of pay dirt. They are separated by a canyon of three miles from the nearest point on the river and by more than 70 miles from the Sacramento valley—the nearest point where debris can do any damage. Others told of a party of 16 poor men who worked 12 years to open a hydraulic mine, a part working for wages to supply balance with mining stores. Just as they were ready to begin work they were enjoined.

Throughout this part of the country farmers are suffering for lack of the market that the mines used to furnish and join the miners in the desire that some measures may be taken by which those mines shall be worked that can be without detriment to other property, and that engineering be undertaken to find where debris can be disposed of to advantage. On returning to Oroville, a visit to Cherokee will give more reliable data concerning reports that they have solved the debris question by a levee system introduced by the superintendent, and that they have realized a handsome profit from lands bought by them for the purpose of disposing of tailings and quieting injunction suits. This seems to be a question vital to this vicinity and it appears as though the law was working great and unnecessary injury. F. S. C.

Taylorville, Plumas Co.

The State Museum.

Among recent additions to the collection of the California State Mining Bureau are the following:

Lignite, from a large vein on Yonker's ranch, Del Norte Co., Cal. R. W. Miller.

Lignite, found over several miles of country in the Hyampum valley, Trinity county, Cal. W. C. Chapin.

Iron ore; magnetite, partly loadstone or "natural magnet," from two large ledges in San Bernardino Co., Cal. H. W. Lake.

Cobalt ore, with argentite and native silver, San Gabriel, Los Angeles Co., Cal. Wm. McEwen.

Gold on quartz crystals, Keystone mine, Humbug Creek, Siskiyou Co., Cal. D. Ream.

Fossils from the basin of the Umpqua river, Oregon. D. C Stone.

Catlinite, "Indian pipestone," Pipestone Co., Minnesota. Minneapolis Academy of Sciences.

Nine specimens of gold quartz and silver ores from the Te Aroha district, New Zealand. Prof. F. D. Brown.

Sapphires from El Dorado Bar, Montana. Geo. Weitbrecht.

Native bismuth from near Salt Lake City, Utah. W. H. Schamp.

Opal in matrix, Honduras. J. Weyl.

CAREFUL WHAT HE DRINKS.—It is said that Gov. Pennoyer of Oregon is supplied with drinking-water from a spring by his milkman who brings the wholesome liquid every day in cans.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

DAVIS'S BRICKS, TILES and TERRA-COTTA.

JUST READY.

A NEW EDITION.

A Practical Treatise on the Manufacture of Bricks, Tiles, Terra Cotta, etc., including Hand-Made, Dry Clay, Tempered Clay, Soft Mud, and Stiff Clay Bricks; also Front, Hand-Pressed, Steam-Pressed, Re-Pressed, Ornamentally Shaped and Enameled Bricks, Drain Tiles, Straight and Curved Sewer and Water Pipes, Fire Clays, Fire Bricks, Glass Pots, Terra-Cotta, Roofing Tiles, Flooring Tiles, Art Tiles, Mosaic Plates, and Imitation of Intarsia or Inlaid Surfaces, comprising every Important Product of Clay employed in Architecture, Engineering, the Blast Furnace, for Retorts, etc., with a History and the Actual Processes in Handling, Disintegrating, Tempering and Moulding the Clay into the Shape, Drying Naturally and Artificially, Setting, Burning with Coal, Natural Gas and Crude Oil Fuels, Enamelling in Polychrome Colors, Composition and Application of Glazes, etc., including Full Detailed Descriptions of the Most Modern Machines, Tools, Kilns, and Kiln Roofs Used. By Charles Thomas Davis, Second Edition. Thoroughly Revised. Illustrated by 217 engravings, 501 pages. 8vo.

Price $5.00, by mail, free of postage to any address in the world.

CONTENTS.—CHAPTER I. The History of Bricks. II. General Remarks concerning Bricks, their Size, Strength, and other qualities. Ornamental Bricks, Architectural Terra-Cotta, Blue Bricks, Saltpetre Exudations upon Brick Work. III. Enamelling, Glazing, and Ornamenting Bricks and Tiles. Earthenware, etc. IV. Selecting Clays for Various Kinds of Bricks—The Different Varieties of Clay—The Characteristics, Qualities, and Localities—How to Color Bricks Red—Kaolin—Terra-Cotta Clays—Fire Clays—Exploring, Digging, and Marketing Fire Clays—Washing Clays. V. Making and Burning a Kiln of Hand-Made Bricks. VI. Manufacture of Dry Clay Bricks. VII. The Manufacture of Tempered Clay Bricks, including a description of the most Modern Machinery Employed. VIII. Kilns. IX. The Manufacture of Pressed and Ornamental Bricks. X. The Manufacture of Fire Bricks. XI. The Manufacture of Drain Tiles. XII. The Manufacture of Sewer Pipes. XIII The Manufacture of Roofing Tiles. XIV The Manufacture of Architectural Terra-Cotta. XV. Ornamental Tiles, etc. Index.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & Co., S. F.

STORAGE We have some extra room suitable for storage purposes, which we will let on very reasonable terms.

THE VICTOR CONCENTRATOR

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,
17 and 19 Fremont Street, SAN FRANCISCO.

CHAS. F. BLACKBURN,

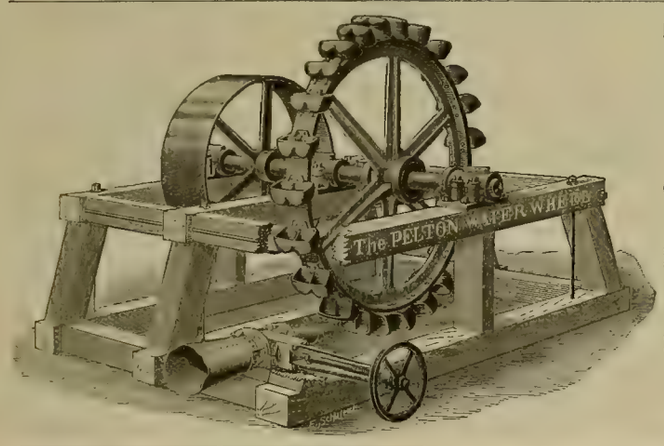
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.



Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 1, 1889.

General business continues slow, although it is reported there is a steady increase in the volume of goods going out. The principal call is still of an assortment character. The trade looks for a decided improvement in the demand toward the middle of August. This opinion is based on the known small stocks carried by interior retail dealers, and the general desire by them to stock up. The many fairs will also attract trade.

In the local market money continues easy, with only a moderate call as yet for crop purposes. It is stated that considerable money has been engaged for use later on, but not to the extent that usually obtains at this season of the year. The comparatively light call is due to more available money in the interior. Remittances continue light, but not more so than usually rules at this season of the year. Latest issue of *Money* to hand reports that gold imports at London from Melbourne had about ceased, and that arrangements had been made to send by the last of this month (August) £2,000,000 from Melbourne to this city for crop purposes. This money no doubt will be diverted here for exchange purposes in expectation of a low rate for sterling exchange on England.

The imports of treasure by sea the past week were as follows: Coin, $10,499; Mexican dollars, 32,927.

The July dividends compare as follows:

	1888.	1889.
Banks	$439,250	$470,000
Gas and Water Co's	138,300	132,600
Insurance Co's	95,500	59,000
Street R. R. Co's	26 250	17,500
Powder Co's	27,000	27,000
Mining Co's	497,920	248,500
Miscellaneous Co's	49,750	77,750
Totals	$1,273,970	$1,032,450

The falling off in the Mining Companies is due, it is said, chiefly to the stock being out on the public, and manipulators desire to buy it back at low figures. The nine savings banks of the city have paid their semi-annual dividends to depositors this month, amounting to upward of $1,000,000, thus making a disbursement of over $2,000,000 in dividends among the people this month.

Mortgages recorded last week were 81; consideration $233,120. The rate of interest was unchanged.

In the speculative markets local securities, outside of powder stocks, have been quiet. The deal in these stocks does not as yet cause much enthusiastic buying by outsiders. The sugar stocks appear to be well dealt out on the public, and consequently sugar is falling and dividends by the Hawaiian Commercial Company and the Hutchison Sugar Company are expected to be of short duration. Wheat options are still attracting attention, the attractive fluctuations bring in outside operators. Mining stocks, after dragging for some time, shrunk on an average fully 20 per cent. The decline brought out margin stock.

MEXICAN DOLLARS—There is quite a call for Mexican dollars for shipment by the steamer to leave on Saturday, August 3d. The price at which they were sold was 74¾ for new and 74¼ for old.

SILVER—The action of the market in London looks as if silver is being made more speculative. The price, after receding, strengthened some and then jumped ⅛d. The New York market has moved slightly in sympathy. With us the market is kept quite strong under moderate receipts and a good demand. The buying is for India, China and Japan. Sales were made at 92⅝@92¾, but on Tuesday 92⅞c was paid, with another advance reported to have been paid yesterday by an anxious buyer. The higher prices here in comparison with New York are naturally drawing freer shipments here, or at least it is so claimed.

London cables quote silver bullion at 42¾d; New York telegrams quote 92⅜c, and in our market sales were made to-day at 73c.

QUICKSILVER—Receipts the past week aggregate 149 flasks. The exports the past week were as follows: Auckland, 40 flasks; South America, 10. The market has continued fairly steady. The consumption on the coast, taken as a whole, shows an increase over this time last year.

BORAX—Receipts the past week aggregated 2189 ctls, and exports by sea to New York 2468 ctls, and to Chicago, 213 ctls via Victoria, B. C. The market is reported firm, with a good consumptive demand at the East.

CHROME ORE—The shipments the past week aggregated 342,330 lbs via Cape Horn.

LIME—Receipts the past week aggregated 5482 bbls, being a decided increase on preceding weeks. The home demand is reported to be increasing. It is claimed that there is some cutting in prices.

LEAD—The market is unchanged, although a better feeling is reported at the East. The consumption on this coast is claimed to be fully up to last year.

TIN—Imports the past week aggregate 8801 boxes plate, and the exports by sea, 1090 lbs to Victoria, B. C. The market is barely steady, with some shading in pig under fair offerings on spot, and for shipment, and not quite so urgent for consumptive call.

COPPER—The market is without essential change in quotations. The tone appears to be stronger.

COAL—Imports the past week are as follows: From Nanaimo, 2760 tons; Liverpool, 3142; Tacoma, 1812; Swansea, 1854; Departure Bay, 5900; Seattle, 2814; Coos Bay, 1250; total, 19,532 tons. The market for both spot and to arrive is without particular change to note. The tone does not appear to be quite so strong, and with heavy arrivals prices may shade off. For prompt shipments there is nothing new to report.

IRON—Imports the past week aggregate as follows: Foreign, 450 tons; Irondale, 110 tons. The spot market gave signs of improvement, but with free imports the tone is weak and easy. The consumption continues light. Eastern and foreign advices report strong markets. The production in the United States for the first half of 1889 was 4,107,000 tons against 3,886,004 tons for the like time in 1888. Nine years ago the total production for 12 months was not quite 4,000,000 tons, so that for the first six months this year it was greater than for the 12 months in 1880.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow, July 19, '89.	July 26, '89.	July 24, '88.

COKE—Imports the past week aggregate 1410 tons. Notwithstanding the free arrivals the market holds fairly steady, owing to all received having been placed to arrive.

Eastern Metal Markets.

By Telegraph.

NEW YORK, July 31, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 5-16	92½	$11 90	$3 87½	$19 85
Friday	42 3-16	91½	11 50	3 87½	19 60
Saturday	42 3-16	91½	11 60	3 90	19 60
Monday	42 3-16	91½	11 50	3 87½	19 65
Tuesday	42 5-16	92½	11 50	3 90	19 65
Wednesday	42 5-16@42½		11 75	3 97½	19 70

NEW YORK, July 31.—Lake copper after advancing fell back some but closed very strong at $11.75@$12 with consumers buying. Electrotype is not obtainable at less than 10⅝@10¾c. Casting brands, sales of which were made latterly at 10c, are quoted at 10¼c at the close. The London market was firmer yesterday. Cables give merchant bars at £4 15s spot, and £4 15s futures.

Dealings are light in pig lead at $3.90@3.97½. Closing firm. The London market for quicksilver is stiff. New York strong at 70c. Borax is steady; powdered, 8¾@9c; refined, 9@9¼c; concentrated, 7¾@8¼c.

Mining Share Market.

Trading the past week was more active, but at declining prices, with quite a shading in prices, averaging fully ten per cent since Monday. The decline was evidently engineered by the pool for the purpose of demoralizing the public and causing them to throw their holdings on the market. Naturally outside holders are afraid of assessments and sell for them, while they buy for dividends. Insiders buy for assessments and sell for dividends. After so great a depression and such low prices, compared with what they were a few months ago, it would seem as if prices ought to be either bottom or very nearly so. The difficulty with outside operators is, they buy more stock than they can care for, and by buying on a margin they seldom make, but lose all, and rightly so. The sinking in the values of the Comstocks took the Quijotoas and Bodies down also, but the Tuscaroras appeared to have had better support, as had Eureka Con. The air is full of bear points—assessments, no ore, and like talk. If persons who are lavish with information know so much they should be rich, instead of poor, as the large proportion are.

From the mines the news is more encouraging, so far as the Comstocks are concerned. The winze being sunk from the 1950-foot level in Con. Virginia, reported to be near the Ophir line, is down some 40 or 50 feet, and is in several feet of very rich ore. The character of this find gives hopes that it will make with depth into a large body of very rich ore. As water will interfere with sinking to any depth below the 2000-foot level, it is not at all unlikely that they will drift south from the Ophir shaft so as to intercept or run into the ore. This winze is from 1200 to 1300 feet from that sunk from the 1950-foot level in Con. Virginia near the Best and Belcher line, and about which the daily papers make so much noise. By those in position to know it is claimed that if work is not suspended they will run into ore in driving west crosscut No. 2 in Union. The nature of the work going on in several of the Gold Hill and middle mines causes experienced mining men to look for happy results before three months pass by. In the Alta group of mines more work is said to be outlined for the near future. From the Quijotoas, Silver King and Eureka Con. no new information is at hand. Several of the leading mining men on the Comstock inspected the Tuscarora mines and report favorably on them. While they apparently vouch for the ore in the mines the public, no doubt, would like vouchers for them, particularly with the stocks of the mines in which they are connected, selling at prices several times less than a few months ago. From the Bodies we have nothing new to report. Captain John Kelly is here, but so far as we can learn is non-committal. As yet our correspondent does not intimate anything worthy of publishing, although he is hopeful of favorable results from the work now going on in the mine, but this has been the outlook so long it is becoming quite stale.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Mt. Diablo, July 27, $11,275; Blue Bird, 20, $18,000; Butte and Boston, 20, $18,896; Lexington, 20, $28,256; Moulton, 20, $10,928; Lexington, 26, $13,088; Hanauer, 24, $2000; 26, $4140; Queen of the Hills, 28, $1200; Horn Silver, 30, $27,000; Hanauer, 30, $4600; Mt. Diablo, August 1, $5800.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.

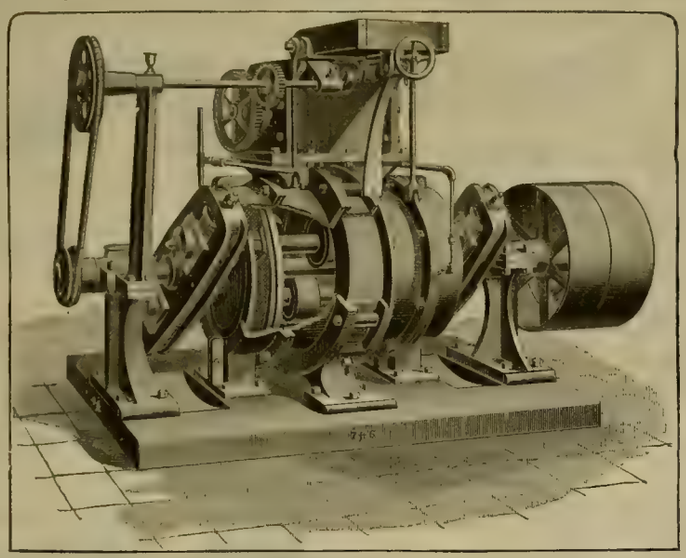
RANCHERS and fruit-growers at Tulare are preparing a petition to Congress asking that the timber-claim system be abolished in this State, as the cutting of t mber in the mountains has decreased the water-supply. Tulare lake is drying up very rapidly.



NEWSPAPER AGENTS WANTED.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 220 Market St., S. F.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

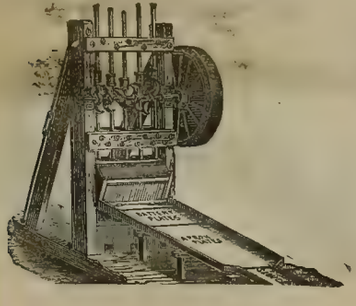
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

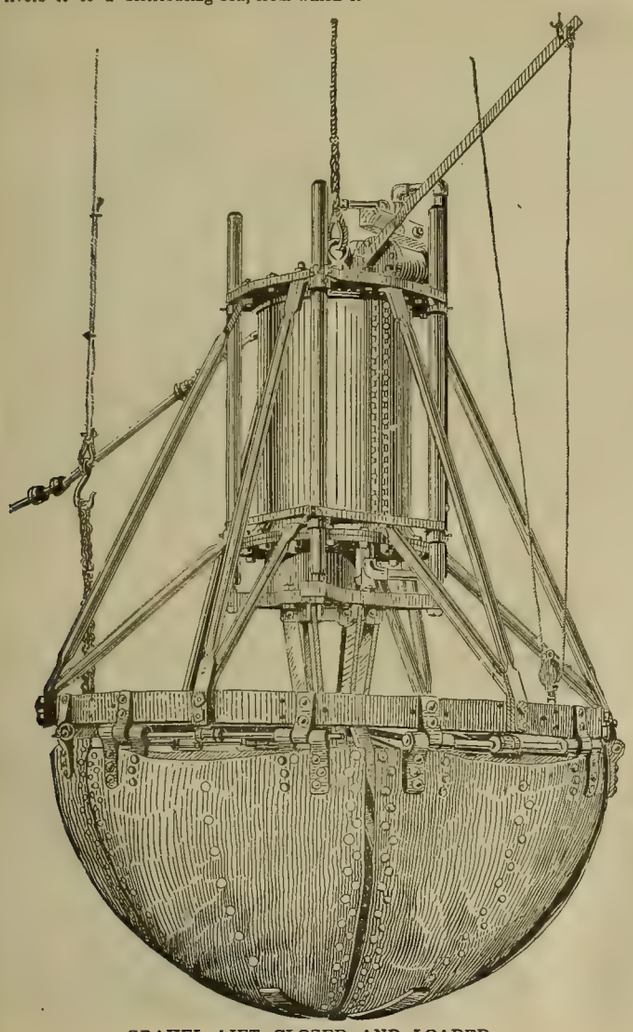
Connecting the Apron and Battery.

Mr. Tregidgo, superintendent of the Blue Bell mine, on the South Yuba river, three miles from the village of Ormonde, has invented an improvement in quartz-mills which is designed to facilitate the operation of changing and repairing screens, renewing shoes and dies, cleaning out the mortar, and such other work as requires free access to the front of the battery, usually obstructed by the apron. It is shown in the accompanying cut, which is taken from the report of the State Mineralogist:



The device consists of a semi-cylindrical iron trough, the length equal to the width of the mortar, and having a breadth of one foot and a depth of six inches. This trough is fixed under the lip of the mortar, in the place usually occupied by the apron; in the bottom of the trough are two openings two inches in diameter, in which are fixed two pieces of two-inch iron pipe, each about 18 inches long, extending vertically downward. The lower ends of these pipes are connected by elbows with horizontal pipes of equal diameter and about three feet long. The trough receives the pulp from the mortar, the pipe into which the pulp flows delivers it to a distributing-box, from which it passes through holes bored in the front on to the apron. By this contrivance the apron is removed some distance from the battery, in front of which the workman can pass without having to climb over the apron or sluice. When it becomes necessary to clean the mortar, the upper ends of the pipes are plugged, the trough forming a convenient receptacle for the rock, sand, etc., taken from the mortar. The sides of this trough are lined with curved plates of silvered and amalgamated copper, not fixed close to the side of the trough, but with a space of about three-quarters of an inch left between.

APRON ARRANGED FOR FREE ACCESS TO BATTERY.

The pulp from the mortar swashes from side to side in the trough in front of the copper plates, and a considerable portion of the gold is retained on the plates, which are secured to the trough by bolts with rubber washers placed between them, thereby preventing their contact. Mr. Tregidgo also uses a lip plate on the mortar outside of the screen. The inside back plates are five inches long by 12 inches wide; the front plates are attached to chuck-blocks as usual, the foot rail of the screen frame being about five inches high, in order to afford the necessary space. The faces of the "chuck-blocks," and consequently of the plates, are rounded in-

Mining-Law Changes.

The Stewart Bill.

The following bill to amend Chapter Six of Title Thirty-two of the Revised Statutes relating to mineral lands and mining resources will be introduced by Senator Stewart of Nevada at the next session of Congress:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section twenty-three hundred and nineteen of the Revised Statutes be amended by adding thereto the following: "But no person shall acquire by location more than fifteen hundred feet in length on the same vein, nor shall any person relocate a claim which he has previously located."

SEC. 2. That section twenty-three hundred and twenty-four of the Revised Statutes be amended so as to read:

"SEC. 2324. The miners of each mining district may make regulations, not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground by posts or monuments so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year for each one hundred feet in length along the vein until payment of the purchase money and a certificate of entry has been issued therefor; and for each twenty acres of placer claims, and for each subdivision thereof less than twenty acres, twenty-five dollars' worth of labor shall be performed or improvements made during each year until payment of the purchase money and a certificate of entry shall be issued therefor. But where several adjoining claims, not exceeding five, whether the same be lode or placer claims, are owned or held by the same person, association, or corporation, and the sum of five thousand dollars or more is expended in any one year in good faith for the development of all the claims so owned or held, not exceeding five, there shall be no requirement for separate labor or improvements to be performed or made on the several claims so owned or held during such year. The year within which the annual labor or improvements required to be performed or made by this section shall commence at 12 o'clock meridian, on the first day of October of each year: *Provided*, That upon claims located previous to the first day of March, in any year, the annual labor or improvements shall be performed or made on such claim for that year, prior to twelve o'clock meridian of the first day of October next succeeding; and upon claims located after the last day of February, and prior to twelve o'clock meridian of the first day of October in any year, the annual labor or improvements required shall be performed or made prior to twelve o'clock meridian of the first day of the next following October: *And provided further*, That only one-half of the annual labor or improvements required by this Act shall be necessary to be performed or made prior to twelve o'clock meridian of the first day of October, in the year eighteen hundred and eighty-nine, on claims upon which the annual labor or improvements were performed or made in the year eighteen hundred and eighty-eight; but after the first day of October, in the year eighteen hundred and eighty-nine, the full amount of labor or improvements required by this Act shall be performed or made upon such claims as in all other cases during each year, prior to twelve o'clock meridian of the first day of October. In case the first day of October falls on Sunday or any holiday, the following secular day shall be construed as the first day of October within the meaning of this Act. When the labor required by this Act shall have been performed, or the improvements made, an affidavit shall be filed within 30 days after the time limited for performing such labor, or making such improvements, with the recorder of the mining district in which such claims are situated, and if there be none, then with the recorder of deeds of the county in which the claim or mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with these conditions, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns, or legal representatives, do not resume work upon the claim after such failure and before such location, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvement may, at the expiration of the year, give such delinquent co-owner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days; and if at the expiration of ninety days after such notice in writing or by publication such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditures, upon recording a copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice with the recorder of the mining district in which such mining claim is situated, and if there be no such officer, then with the recorder of deeds of the county in which such mining claim is situated. When any person or company has developed and exposed a lode, and expended one hundred dollars' worth of labor thereon, said person or company may run a tunnel for the purpose of developing such lode owned by said person or company, and the money so expended in said tunnel shall be considered as expended on said lode, and such person or company shall not thereafter be required to perform labor or make improvements on the surface of said lode in order to hold the same, so long as work is continued on such tunnel."

SEC. 3. That section twenty-three hundred and twenty-five of the Revised Statutes be amended so as to read:

"SEC. 2325. A patent for any land claimed and located for valuable deposits may be obtained in the following manner: Any person, association or corporation authorized to locate a claim under this chapter, having claimed and located a piece of land for such purposes, who has, or have, complied with the terms of this chapter, may file in the proper land-office an application for a patent, under oath, showing such compliance, together with a plat and field-notes of the claim or claims in common, made by or under the direction of the United States surveyor-general, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit that such plat and notice have been duly posted, and shall also file a copy of the notice in such land-office, and shall thereupon be entitled to a patent for the land, in the manner following: The register of the land-office, upon the filing of such application, plat, field-notes, notices and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant at the time of filing this application, or at any time thereafter within the sixty days of publication, shall file with the register a certificate of the United States surveyor-general that five hundred dollars' worth of labor has been expended or improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant shall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during such period of publication. If no adverse claim shall have been filed with the register and receiver of the proper land office at the expiration of the sixty days of publication, it shall be assumed that the applicant is entitled to a patent, and that no adverse claim exists, and upon the payment to the proper officer of five dollars per acre he shall receive a certificate of entry; and thereafter no objection from third parties to the issuance of a patent shall be heard except it be shown that the applicant has failed to comply with the terms of this chapter. But no more than three thousand feet in length along the vein of claims located prior to the tenth day of May, eighteen hundred and seventy-two, and not more than the extent of one claim fifteen hundred feet in length by six hundred feet in width located after said date shall be included in the same application for a patent, and not more than eighty acres of placer ground shall be included in the same application for a patent."

SEC. 4. That section twenty-three hundred and thirty-four of the Revised Statutes be amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

SEC. 5. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in any State or Territory of the United States or in the District of Columbia, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same, shall have the same force and effect as if taken before the register and receiver of the land office. In cases of contest as to the mineral or agricultural character of land, the testimony and proofs may be taken, under such regulations as the Commissioner of the General Land Office may prescribe: *Provided*, That the presence of rock in place bearing gold, silver, cinnabar, or other valuable metal, shall be regarded as prima facie evidence that the land containing the same is mineral in character; and veins of rock in place bearing such minerals and appearing on the surface of the ground, or in excavations made thereon, shall be regarded within the meaning of section twenty-three hundred and thirty-three of the Revised Statutes as veins or lodes known to exist."

SEC. 6. Amend section twenty-three hundred and thirty-eight of the Revised Statutes so as to read:

"SEC. 2338. As a condition of sale each patent shall reserve the right of way through or over any mining claim for roads, ditches, canals, cuts, tunnels and other easements, for the purpose of working other mines. *Provided*, That any damages occasioned thereby shall be assessed and paid in the manner provided by the laws of the State or Territory in which such mine is situated for assessments and payments for land taken for public use under the right of eminent domain. And the rights and easements heretofore reserved under the provisions of this section (twenty-three hundred and thirty-eight of the Revised Statutes) in patents heretofore issued shall be regulated and made available as herein prescribed."

Meadow Lake.

In an interview with John Clarke of this place our reporter has been able to glean a number of very interesting items concerning Meadow Lake district, the place that is the rebellious ore district.

Work at Meadow Lake has been almost entirely abandoned for a number of years until lately. Our informant says that the excitement there now is caused by the finding of a process by which the gold can be saved—the Morris process. He says that this is a thorough success in his opinion, as 97 per cent has been saved by a good test. On hearing of the process, capitalists from all over have sent experts to Meadow Lake, and prospectors are crowding in thick and fast. John Mackay has had two experts examining claims there from Nevada State for the past three weeks. Some Utah parties are also there.

Meadow Lake mineral belt is about nine miles square. From one end to the other it is nothing but a solid mass of quartz ledges. About 20 years ago Meadow Lake was a town of 12,000 inhabitants, when mills and chlorination works, etc., were built on many claims. The ore was found to be rebellious, and consequently the town was deserted and the constructions were left behind to rot or be destroyed, as might be the case.

Messrs. John Clarke, Frank Cook and Victor Blodgett have located, and are at present working the tailings of the Grub Stake, formerly known as the California ledge, and the Oro Fino ledge. The tailings, which were worked years ago by arastras and only 20 per cent of the gold saved, are now being worked by the above gentlemen with a small and simple apparatus invented by Clarke, and about 85 per cent is saved. By working these tailings they have realized considerable over wages, besides being able to do their assessment work on their claims at the same time.

The average width of the Grub Stake and Oro Fino ledges ranges from eight to forty feet and they are well-defined ledges with good walls. It is the intention of Messrs. Clarke, Cook and Blodgett to put a mill on their claims this fall if possible and use Morris' canvas process. The mill which they intend to erect has four stamps and was put up a short distance from where they want it now at the time of the boom.

If the Morris process for saving the gold proves as good on a large scale as it has on a small scale, the famous Meadow Lake district will again boom, this time permanently.—*Sierra Tribune*.

THE PHILADELPHIA SMELTING PLANT at Pueblo, Col., Edward R. Holden, manager, will soon be the largest in the world. They are now treating 350 tons daily. By July 15th four additional roasting furnaces will be in operation, and by Aug. 15th four more blasting furnaces will be in working order, making the total capacity of the plant not less than 500 tons daily. Mr. Holden recently secured a contract to treat, per month, 3000 tons of ore from the Sierra Mojada mine in Old Mexico, thereby placing his Pueblo smelter in direct competition with the smelters of the Missouri valley, which have heretofore been treating Old Mexico lead ores coming into this country free of duty. If duty is at any time put on lead it will cut this supply off. But Mr. Holden is inclined to think that such will not be done. He says that there are more dry ores in Colorado than there are lead ores, and while it would be to the interest of the miners to shut out the product of Old Mexico, it would materially increase the treatment of dry ores.

IF there were but one grindstone in the world and no sandstone for making any more, the one existing grindstone would be of immense value, and would probably be secured by some flashy millionaire to wear as a shirt-stud.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Tuolumne Mines.

Claims in Rawhide District.

EDITORS PRESS:—With your permission I will give in this communication a short report on some of the mines in the Rawhide district, the nearest postoffice to which is Jamestown. This group extends from Table mountain northwest to Mormon creek. The first mine north of the mountain is Rawhide No. 2. It has been opened by a small shaft, which exposed a very large vein of fully eight feet in width and no walls yet in sight. At the time of my visit I could see free gold in the quartz, generally surrounded by azurite, with fine specks of tellurium. Certainly the rock contained sufficient free gold to pay. No doubt in the future, when developments are made, a profitable mine will be found, for the indications are very favorable.

The adjacent mine north on the same lode is the Rawhide No. 1 (patented) recently purchased by Nevills & Co. They have secured a most valuable property, for in the early days a very large amount of gold was taken out from the upper levels, near to the surface. Two shafts have been sunk upon this mine with steam machinery, etc., but the mine is now under water. There is a mill of 20 stamps which is what might be termed an old silver mill, with a series of Hepburn pans, not in any way suited to treat the class of ore here found. This ore is heavily charged in the lower levels with tellurides in the forms of native tellurium, calaverite, combining with gold and silver, as well as petzite, specimens of which I have had in my possession of great richness, assaying into the thousands. These ores of course require special treatment after having been concentrated. At the time the mine was running, the pulp was treated in the pans. The bases sickened the quicksilver (antimony being also present). The majority of the free gold was lost and washed down the creek, hence through ignorance and wastefulness, a rich and valuable mine was closed down. Of course the rich bases suffered the same ill fate and were lost, the company having no concentrators to save them. I trust to be able to report in the future of the prosperity of this, another of Tuolumne's rich mines.

Next to this mine, north, is the Rappahannock. A shaft has been sunk and I have seen some fair specimens of golden quartz taken out, but the shaft was sunk on the talcose slate to the east of the main vein; hence the richness or otherwise of this property is undetermined. It is rational to assume, however, that if opened up on the right line the same rich ore would be traced as in its neighbor, the Rawhide No. 1, for on the surface rich free placer gold was found that must have been left by time and erosion of the quartz seams and golden threads that interlace and cover the surface in this mine. It is owned by Richard Chute of San Francisco.

The next mine north is the Isabella, a patented claim owned by Mr. Jno. Faxon of Sonora. This mine is opened by several small shafts (not deeper than 20 feet), cuts and tunnels. Everywhere that the lode was tapped pay-rock was found. The rock carries the same bases as the Rawhide No. 1, but in a lesser degree, depth not having been attained to prove its richness. There is sufficient development made, however, to warrant a systematical opening up of the mine as well as giving it the value asked by its owner. Besides, I will here mention that there is an unseen value in this mine to the casual observer, which is its key to the successful working of the Rawhide and all the other mines south. From its topographical position it commands the outlet to Mormon gulch, at which point a main tunnel could be entered to drain all the mines in its course to a depth of several hundred vertical feet. A vast amount of water would be set free, which alone would be most valuable for irrigating and other uses. The water stored under Rawhide Flat is immense.

Again, to the north we find the Alameda mine, with which I am most conversant, having myself been connected with it during the tenure of former owners, now deceased, and can speak authoritatively.

I inclose a "plat" of the Alameda mine and vein, as it passes into the Isabella to the south and the Tarantula to the north. This mine is 1500x600, and is opened almost its entire length by shafts, cuts and tunnels, and is the same vein as Rawhide, being the bowlder vein of the mother lode or main vein. The Alameda enjoys equal topographical conditions that the Isabella does, having its base to Mormon Gulch, or nearly so, and a main tunnel entered jointly by all the mines in this group could be so entered as to pass through the Alameda first, thence to the Isabella and southward through the other mines, making one grand drainage system. If the expense was jointly divided this would result in a great and grand undertaking of mutual advantage—a prospective work I much desire to see consummated. The vein is large, will average, probably, 12 feet. In many places I know 20 feet or more of vein matter will be found. I have had rock from this mine worked that has paid, in mill and arastra, from $22 to $80 per ton in free gold. These are facts. There are plenty

of bases that are refractory in this mine and along the line of the group, but they can all be treated by special system, being of exceedingly high grade that will leave a magnificent margin of profit.

I find the bases in the Alameda are similar to those in the Rawhide, viz., azurite, nickel, galena, antimony, native tellurium (rich in gold), calaverite, and petzite (also very rich). I have also found an arseniate of cobalt. Truly this is a grand mine for the student of mineralogy. I know of no instance in Tuolumne county where the bases are so diversified as in this Alameda mine. Then again there are some exceptional diversifications in geological lore in this mine that are only found in rich gold-bearing formations, but to enter into the subject here would take up too much space. But they exist, which is conclusive to my mind, after nearly 35 to 40 years' study and practical mining knowledge, to be, when found, always a necessary desideratum to a successful paying property. I have traced the pay rock continuously on the Alameda for 1000 feet and have made numerous scorifications, assays, etc., with most pleasing results. As Messrs. Hayward & Hobart are doing some prospecting on the property at the present moment, I trust to their becoming the future owners, for in their hands success financially is assured, not only to themselves, but to this county. The richest rock I found was on the footwall, a stratum that is exceedingly rich in free gold. I have made careful mining surveys of the old works but will not trouble you with a section. My desire is to see Tuolumne figure as a great gold-producer, which it should be, and can be, if we get capital to unearth her mineral resources and the right class of men to operate, who possess sufficient scientific knowledge in the treatment of the ores. It is an easy matter to find plenty of good miners to extract the crude material from its resting-place, because that is simply mechanical; but to save the gold and extract it from its metallic embrace is a matter of science alone. It is a happy thing for this age of advancement and knowledge that such can be accomplished, freed from any foolish chimerical nonsense, by the result of chemical and scientific knowledge alone. The days of free-gold working by the old clumsy stamps and mortar plays a very insignificant part in the reduction of our gold rocks to-day. Pulverizing the quartz can be done in many ways, but gold saving at a profit from rebellious and refractory ores is a matter for the metallurgist to solve in a plain, simple and inexpensive method, whereby a good marginal profit is attained and everything, or metal of value, saved in the one process.

Next in order to the Alameda northwest is the Tarantula. The rock is very similar to that in the Alameda, being of course on the same vein, but frequently cross courses cut into lodes and change their character either for the better or worse, throwing into the parent vein a different metal or decreasing or increasing the gold pay. Nearly all along the line of this group quite large veins enter and come into contact with the main vein, coming through the footwall. I have found where the wall rock at the point of contact is genial—say, for instance, a dyke of intrusive or eruptive rock, being on the wall, or entering with the cross vein, will be productive every time of good results. I find in the Alameda more of this class of intrusive rock on the footwall, and coming into it, than any other mine in the group; but perhaps it is because this Alameda has been more extensively opened than any other of its neighbors—not in depth, but laterally and horizontally—giving one a chance to better examine the wall rocks.

The Tarantula is opened by a 90-foot shaft. The rock has milled from $6 to $40 per ton. It is owned by Mr. Frisbee of Sonora and is patented. Next to the Tarantula is the "O. K." mine, also the property of Mr. R. Chute, but it is to the east of the main vein and not on the same line as the group south, but rich quartz has been found in some of the strata. This is the most northerly mine of the group.

ARGUS.

ELECTRIC MOTORS are now applied on warships for hoisting ammunition, instead of using the "pony" steam engine. The new method insures more of convenience, cleanliness, economy of space and coolness of atmosphere. Is there any time and place where electricity may not efficiently supersede steam in performing ordinary labor?

The Idaho Gold Region.

EDITORS PRESS:—This Salmon river section, the famous gold portion of Idaho, is troubled with a scarcity of water this season. The placer mining is about ended for the summer except on the larger streams. The quartz mines are being worked and with very good results. The Kentuck and Grunter and Clipper-Bullion mines near Shoup are producing well this year. Other gold veins are being opened near Leesburg, Gibbonsville on Pine creek; and about 10 miles down the river below Salmon City some fine free-gold ledges are being worked. All these quartz ledges are of an exceedingly promising character and no doubt a number of rich gold mines will soon be opened up in this vicinity.

This gold field is 50 to 100 miles from the railroad, but there is a good wagon-road to the river and machinery can be gotten in cheaply to the mines below by floating it down on flat-boats. It is 200 miles down the river from Salmon City to the old Florence and Warrens diggings, and this entire mountain section is known to be good as a gold quartz country. Some very large veins outcrop, showing good pay ore to begin with, and the facilities for working them are first-class; there is plenty of wood and an abundance of water.

No doubt, a few years hence there will be a number of mills along the river (Salmon) crushing gold out of these rocks. The gold veins found in this section are mostly of free-milling ore, going from one-half to five and ten ounces of gold per ton, and it can be mined and milled very cheaply.

In the Continental divide, directly east of Salmon City, there is a mineral belt 40 miles in length that is known to be rich in gold, silver, copper and lead. Col Shoup (our present Territorial Governor) is the owner of some valuable gold and silver mines in this section.

Eventually this great gold-field will become the most productive region in the West; that is, as a gold quartz country.

Enterprising men, with means, could make a large sum of money by coming and taking hold of these properties. CHAS. F. BLACKBURN.

Salmon City, Idaho.

A Nevada Iron Deposit.

EDITORS PRESS:—Knowing that your paper is on the lookout for the interests of the miners, I wish to inform you that an immense deposit of iron ore (that carries at least 80 per cent), some 3000 feet long by 300 wide, has been discovered in Humboldt Co., Nev., by P. K. Reid. Now that the Government lets contracts for building iron vessels in San Francisco, this is a good chance for some enterprising company, as this body is so immense. It lies about 18 or 20 miles from the railroad, but even with this difficulty it can be put f. o. b. at Lovelocks, Nev., on C. P. R. cars at about a cost of probably $6 per ton. The owner, Mr. P. K. Reid, will either sell by the ton or will sell out his interest for a reasonable price. He courts correspondence on this subject; that is, if party is doing so with intention of buying. Should you know of any parties whom this would interest I wish you would let them know that it is the richest and largest deposit of iron on this coast, as it is very near as solid as the solid metal itself. P. K. REID.

Lovelocks, Nev.

Manufacture of Mica.

The Lubricant by a New Process.

Mica is a mineral that abounds in large quantities in Colorado, says the Denver *Tribune*, and is one, when properly handled, that can be put to a variety of uses. Owing to the want of proper machinery to handle it, it has been impossible heretofore to utilize it for purposes to which it is especially adapted. The principal use to which it is put at the present time is for stove doors, wall paper and some kinds of rough bronzing.

Recently a company was formed for the purpose of manufacturing a mica lubricant. The peculiarity of mica as a lubricant lies in the fact that it is absolutely anti-friction, and it is claimed that with it hot boxes or journals are simply impossible.

This new company is incorporated under the name of the Railroad Mica Lubricating Company, with a capital stock of $200,000. The officers of the company are: Senator Charles H. Abbot, president; S. W. Kimble, vice-president and general manager, and S. McClanathan, secretary and treasurer.

Yesterday a reporter of the *Republican* visited the works, which are now in operation, and was shown through by Manager Kimble, who kindly explained the various workings. The mica comes to the factory in carloads, just as it is taken from the mine.

It is fed by boys into two machines, which cut it into small fragments about half an inch in size. By a system of pneumatic tubes the mica, so cut, is delivered to the atomizing machines, which grind it into powder. These machines one must see to fully realize their peculiar action and construction. Each machine consists of two steel shafts three feet long, with a series of gun-metal spirally arranged beaters, which revolve in a closed case forming a figure "∞" When in operation these machines make from 5000 to 7000 revolutions a minute. The beaters on the revolving shafts are so arranged that the fingers on one pass between the fingers on the other shaft, so that when the material is passed through the pneumatic tubes from the feeding machine to the atomizers at a velocity of 15 000 feet a minute, the work of atomizing is instantaneous. The mica, now reduced to atoms, continues its course at the same velocity through another set of pneumatic tubes to the settling-bins. Here the current is so retarded by the peculiar mechanism that it causes the material to settle in the various compartments, of which there are six, at the same time grading the material according to its fineness. The powdered mica is now settled in the hoppers or bins, immediately over the mixing-pans. Here the several grades are drawn into the pans, which are provided with mechanical mixers, and the lubricant is made up by the use of the proper percentage of oils, mica and such other ingredients as the company uses in the manufacture of the product. Directly over the hoppers are located the oil-tanks which supply the mixers by a pipe running down on the outside of the hopper, on the end of which is a faucet.

At the south end of the bins there is located a large cylindrical machine four feet in diameter and ten feet high, that is called a dust-arrester. Any of the material that is so light and fine that will not settle is driven into this machine by air currents which thoroughly separate the mica dust from the air, where it settles in the bottom of the machine and is drawn off as needed.

All the machinery used in the factory and the system of handling the material is the invention of Mr. S. W. Kimble, the manager of the works, and is covered by patents belonging to the company.

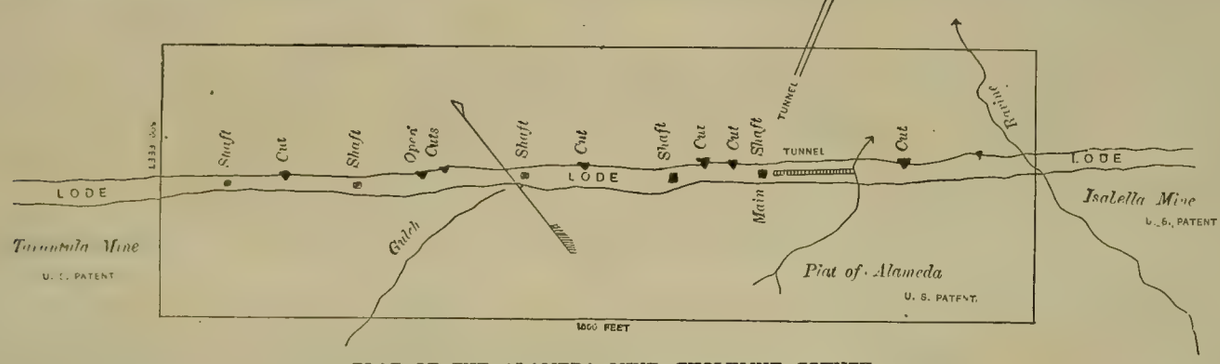
It is stated that the capacity of all machinery heretofore made for pulverizing mica has been from 300 to 400 pounds a day, and then the material has not been sufficiently fine for lubricating purposes. It is claimed for this new concern that it can pulverize about five tons a day, or in ten hours' running. The new factory will begin active operations to-day. A number of experimental runs have been made, and in every case the result has been satisfactory. A carload of mica was received yesterday and five more cars are en route to Denver.

It is the intention of this company to make a special lubricant for dynamos and other high-speed machinery—shaftings, journals, etc., in addition to the ordinary lubricants for railroads, cable lines and machinery of that character.

If the manufacture of mica lubricants proves to be a success, and there is no apparent reason why it should not, it will be a big thing for Denver and Colorado, and this modest factory will become one of the largest concerns in the country. The necessary ingredients, mica and oil, are plentiful in Colorado. It is stated that up to the present time the railroads of the country have never succeeded in getting a lubricant that would do away with hot boxes and journals. If this new lubricant will do that, and that is what its reputation is based upon, it will take several factories to supply the demand from the railroads alone.

Altitudes.

Astronomers have long been aware that the perturbations in the lower strata of the earth's atmosphere greatly hindered their getting clear views of the heavenly bodies. Consequently they have begun to favor the building of observatories at high elevations. The Lick Observatory has been built at great expense upon a mountain 4000 feet above the level of the sea. Here has been mounted the largest object glass in the world, and grouped around it a corps of able and experienced astronomers. The scientific world eagerly waits the revelations they are almost sure to make known. Here they are at work day and night in a clear, almost cloudless sky, while fog, clouds and smoke may envelop the valley. Only the other day a comet was discovered there so pale, tenuous and evanescent that it has not yet been seen by the astronomers in the more vaporous sky of the East.



Then the mountains of our country and Europe are every summer populous with the seekers after pure air and water and rare scenery. Tourists will visit Mt. Shasta or Mt. Washington to feast their eyes upon the extended, varied and wonderful landscapes spread before them from these altitudes. They will, in Europe, leave their beds at 3 o'clock in the morning to climb Mt. Rigi, in order to see the sun pour its radiance over the mighty waves of the Alps, illuminating a vast extent of country. Hotels and resting-places are built on these great elevations, and the time and money spent on these trips are never regretted.

Even our geographers begin to feel the need of going into the air. Instead of being content to triangulate the surface of the earth, they are getting into balloons and giving us maps and photographic views taken near the edge of cloudland.

Now our theosophical friends have a wonderful knack of seeing a spiritual meaning in material things. A snake with its tail in its mouth is a picture of eternity, and gophers and jack-rabbits are permitted to go scot free as representatives of the infinite life. But passing this all by, there is a moral lesson to be learned in high elevations. We have only wide views of history, society and the course of human events as we stand on great altitudes. In no other way can our horizon be enlarged.

In no other way can we see the comparative magnitudes and true relations of things. This is as true morally and intellectually as in the physical world. We are prone to look around us and into the spiritual heavens through a murky and unquiet atmosphere. The mists of ignorance envelop us and the miasms of doubt and prejudice are thick around us. The swift currents of passion, the various and fluctuating winds of time and place, sect and party so greatly perturb the air that we get a mere glimpse of the spiritual universe. Our astronomy is a peep over the chimney-tops and our geography the width of a railroad track. The fact is, we see this mighty drama of Divine Thought passing through time, with stars and planets for stage-lights, according to the color of the glasses which we wear. Surely there must be some hilltop or mountain range not far away where we can rise above the arid and commonplace, some lofty peak where we may find a clear vision and a surcease from doubt and despair.

The artist finds a temporary and blissful oblivion in his ideals; the philosopher finds a sort of nepenthe in his theories, and the litterateur finds an escape from the frets and worries of the present on the forest hights, where genius has lived and toiled. The lover of music is often so borne along on the tides of song and harmony as to forget to eat. The Christian mounts on the wings of faith into such a clear air that he can read his "title clear to mansions in the skies." Indeed there are hundreds of roads to the mountains. Elevations are accessible to all of us; we may carry little observatories in our hearts, and while busy with our daily drudgeries, take an occasional peep at the stars. We may daily and hourly live on the mountain-tops of some great hope, love, faith, useful occupation, charitable deeds and grand theory of the universe. But, after all, let us remember that while Jesus was transfigured on the Mount, it was in the wilderness He met and vanquished the tempter.

PLAT OF THE ALAMEDA MINE, TUOLUMNE COUNTY.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

STRUCK A LEDGE OF CHROME.—Livermore *Herald*, July 29: The workmen at the Douglas chrome mine on Cedar Mountain struck a fine ledge of chrome, just south of the old workings, last week. They will begin taking out ore at once and thus investigate the extent of the find. This is an entirely new ledge, the existence of which, however, was suspected a year or more ago. Some prospecting was done, a few feet too far to one side. There is also an exposed ledge in the old workings.

Amador.

ALPI.—*Ledger*, Aug. 3: At a meeting of the directors of the Alpi Development & Mining Co. held last Saturday, it was resolved to suspend all operations for the present. After extending the tunnel 60 feet further into the hill, it was found that the ore body at this point had pinched to about four or five inches in thickness. A crosscut was run 15 feet, but failed to reveal the presence of any more quartz. This fact, however, had no discouraging effect. The ledge is long enough and wide enough for all practical purposes. It was thought desirable to take out about 200 tons of ore and have the same hauled to the Moore or some other mill near by for a test crushing, so as to determine as near as possible by actual mill process whether the rock carries gold in sufficient quantities to pay. This plan could not be carried into effect, owing to the slacking up of the water supply. Under the circumstances it was concluded to bring everything to a close, and practically wind up the company's affairs.

NEW LONDON.—Everything is bustling around this mine. Fourteen men were put to work grading for the mill early this week. The steam boilers and other machinery have arrived on the ground. The lumber for the mill will be obtained from Tarr's mill, and some of it is already on the ground. Everything will be pushed right along from this time on, and it is expected the 40 stamps will be in motion in November. The mill is to be first-class in every respect.

MISCELLANEOUS.—The Dyer cannon-ball quartz-mill, erected on the Grainger mine at Pine Grove, has been running two weeks and has been doing good work. It runs by steam. The shortness of water has been a source of trouble. They have about ten tons more to finish the crushing. The Oneida mill has been idle since June. It has been running on the dump-pile, which is too poor to pay for water-power at the usual rates. When the Zeile mill is running to its full capacity the Oneida mill can get motive-power at trifling cost, as the water from the wheel is used over again in the Zeile ditch. The ten stamps at the Oneida therefore are expected to start up as soon as the 40 stamps of the Zeile get to work. The Plymouth Con. is employing only four men. The cause for this suspension is not very clear. The impression widely prevails that stock manipulation is at the bottom of it. If this is the correct explanation the prospect favors a protracted period of idleness. Some exceedingly rich ore has been struck lately in the 200-foot level of the Gover. The Zeile is taking on more miners preparatory to starting the mill to its full capacity of 40 stamps.

Butte.

A RICH STRIKE.—Oroville *Register*, July 27: In an early day in Butte the Blackleg was an important gravel mine. It is situated near Nimshew, and though known to be valuable, no work has been done upon it for many years. A tunnel about 1200 feet long was run to reach the rich pay gravel, and this tunnel was considered so dangerous after the mine had been worked a year or two that the mine was abandoned. A well-known merchant of this town, Mr. Floyd Taber, was the last man to do any work in the tunnel. He was living in that region, and believing that the old mine still contained plenty of gold, went to work in it for a short time. He took out $6000. One day while he happened to be out of the tunnel washing some gravel there was a bad cave in the mine and work was at once stopped. Recently, Mr. John Malay, an experienced miner, was employed to open the old tunnel and extend it a short distance. He put the old tunnel in as good shape as possible and then ran a short distance in search of pay gravel. He was quite successful and struck dirt that paid splendidly. The object being to develop the mine, a second tunnel was run to ascertain the width of this pay streak. It was struck in the second tunnel and richer than ever. Five carloads when washed returned $50, or $10 per car. We learn that it is contemplated running a new working or main tunnel.

Calaveras.

THE RATHGEB.—*Prospect*, Aug. 3: A new shaft is being sunk at the Rathgeb mine and is now about 35 feet deep. Work will be resumed on the old shaft the first of September so as to get out ore enough to kept the mill running next winter.

Inyo.

CERRO GORDO.—Inyo *Register*, Aug. 1: Last week 98,000 shares of the capital stock of the Union Con. M. Co. of Cerro Gordo were transferred to D. O. Mills and Archie Farrington, the consideration being 43 cents per share. The company will be reorganized at once, and mining operations resumed at the mine on a large scale. An air-compressor of a three-drill capacity will be put in when crosscutting. The massive limestone belt constituting the mineral zone, in which the lead pockets are found, will be systematically pursued. The Union pocket alone produced over $8,000,000 in lead, silver and gold, and there is every reason to suppose that by systematic exploration other pockets as large or even larger will be found. When it is considered that the Cerro Gordo lead belt, or mineralized zone, has an east and west width of about 1000 feet and a north and south length of about two miles, and that but a very small fraction of this great mineralized fissure or zone has as yet been prospected or explored, the possibilities of its future production can hardly be realized or contemplated. The new company will proceed at once to the erection of an improved Bleichert elevated tramway, with a carrying capacity of 150 tons daily. The cost of carrying down ore from Cerro Gordo to the railroad is estimated at less than 10 cents per ton. The round trip from Cerro Gordo to the railroad and return it is expected can be made in less than one hour. Special cars for carrying passengers will be constructed, when one can experience the sensation of traveling in mid-air across valleys and gorges 500 feet below. A new town will be laid out on the Eastside canal at the 30-foot fall, where 300 horse-power is obtainable. A furnace and stamp-mill will be erected, to be run by water-power, where the Cerro Gordo ores will be reduced. It is calculated that ore, slag, flue dust, etc., can be sent from Cerro Gordo to the reduction works for 50 cents per ton. With the new deal at Cerro Gordo, all join in believing that prosperity will once again return to the county. Other capital will follow and invest in and open up adjoining properties.

FOR ORE TRANSPORTATION. — *Index*, Aug. 1: That the Union mines at Cerro Gordo will pass into the hands of a syndicate and be worked on an extensive scale is a foregone conclusion. Among those mentioned as interested parties are Archie Farrington, D. O. Mills, H. M. Yerington, Frank G. Newlands, Evan Williams, D. A. Fender and others. There is much good ore yet in the Cerro Gordo hill, and a vast quantity of what is popularly termed low-grade ore. The cost of transportation from mine to railway—$3 to $3.50 a ton—has hitherto rendered the handling and working of low-grade ore unprofitable. Prominent railroad officials who have recently visited Keeler have made preliminary surveys for a branch of the C. & C. to connect with a tramway from Cerro Gordo, which, once built, would reduce the cost of transportation to comparatively nominal figures. The plan is considered entirely feasible. Parties familiar with the locality estimate that 4½ miles of railroad and 2½ miles of tramway will supply the missing link and supplant expensive teaming.

Mono.

MONO.—Bodie *Free Press*, Aug. 5: During the past week south drift, from winze from main south drift, 1000 level, was advanced 17 feet. Southwest drift, 1200 level, was advanced 17 feet. West crosscut from south drift, 1200 level, was extended 11 feet. There were employed 17 miners, 1 foreman.

THE BODIE CON.—During the past week west crosscut No. 2 from north drift, 1200 level, was advanced 16 feet. Jointly with Mono west crosscut from joint upraise from main south drift, 1200 level, was extended 27 feet.

Nevada.

PROSPECTS.—*Tidings*, Aug. 6: One of the best prospects in the Grass Valley mining district is situated between the railroad track and the Idaho gap. It comprises 3000 feet of ground and is known as the O. K. and A. B. C. Consolidated, or South Idaho. A tunnel in the hillside a distance of nearly 400 feet, shows a 30-inch ledge in its face between slate walls, with numerous stringers converging. The ore is solid, though the ledge is but 60 feet underground, carries sulphurets and other minerals and is promising in all respects. The ledge runs east and west and pitches south at about 70 degrees. Messrs. Joseph O'Keeffe and James McKenna are working miners, supporting families, and have developed their property between "shifts." Michael Hogan owns an adjoining claim termed the Parnell. In the early days this was superficially worked with big profits by Easley & Ragan. An extension of the Parnell—the Gladstone—is owned by Messrs. Hogan and O'Keeffe. All of this ground, including the O. K. and A. B. C., comprises a portion of that claimed by Henry Hanssen as agricultural and the suit involving which was justly won by the miners. A shaft 27 feet in depth, on the O. K. and A. B. C., shows a 14-inch ledge of decomposed quartz which will undoubtedly yield from $12 to $15 by mill process.

Placer.

PICK AND SHOVEL.—*Herald*, Aug. 3: The gravel in the Mayflower is richer in the last upraise in the south gangway. A. Clark has sold the Orono claim at Bath to the Mayflower Co. This mine when opened will probably be as rich as the Mayflower. Breece and Wheeler are putting on more men. G. L. Threlkel and partners are well satisfied with the prospects in the May Blossom ledge above Last Chance. The Hathaway mill now has 20 stamps, but only 15 are running, owing to the lack of water. Very rich ore has been struck in the top lead about 150 feet east of the Butt's shaft. The White boys are taking out rich rock in the old Moore ledge on Duncan hill. Their receipts for last week were $1000. The quartz at the bottom of the shaft is of a singular quality. It can be picked to pieces with the fingers. The Gray Eagle tunnel is now over 50 feet in length and in soft rock. Only four men are employed at the tunnel. The running of the tunnel will be done on contract. Anthony Clark is still prospecting the Big Channel mine.

GOLD RUN.—Cor. Placer *Republican*, Aug. 3: Everhart is drifting in his quartz mine and expects to tap the ore vein very shortly. They have taken good pay from his mine and several S. F. men have offered good money for it, but Mr. Everhart does not propose to sell at figures offered. Mr. Gayetty is still taking out ore from his rich mine. He expects some S. F. parties, who have become interested, here in a few days, and then they will look the ground over for the purpose of erecting a stamp-mill. Several prospectors are working in this vicinity on quartz ledges that show up well so far.

ECLIPSE.—Placer *Argus*, Aug. 4: The Eclipse mine near Ophir is being reopened. This mine has always paid and they expect to put up a mill shortly. The Frue concentrator at the Hathaway mine works like a charm. They will put in 10 additional stamps before long. Preparations are being made by Capt. Hubbard to resume work on the Gold Blossom. Shurtliff is at work on the old St. Patrick mine, and has had some fine cleanups lately. Col. J. W. McCullough has resumed work on the Minna Rica mine.

Plumas.

GOLD.—Plumas *National*, Aug. 3: Mr. Nelson brought in 110 ounces of dust to Thompson & Kellogg's the other day; this was made by one day's work; $2000 for a day's work is not bad. There is some hope of the Green Mountain starting up, as there is to be a detail survey made on the mine this summer. The Little Jameson claim is still in litigation, and hence nothing is being done with it. Some talk of a compromise. It would be a good thing, as it would permit a wonderfully rich mine to be opened up.

Shasta.

BEECHER.—Shasta *Courier*, Aug. 3: The shaft on the Beecher mine near town is down 40 feet and the ledge looks well. The work is not progressing very rapidly, as the force is small. If it is the desire to prospect the ledge to any great depth before the rains come to fill the shaft, more working force will have to be put on.

MILL.—It is stated that a mill will be put on the mines sold by Coleman near the old Dingee place on the Shasta and Centerville road. Considerable work has been done on these mines, and although the ore is not of high grade, it is thought that it will pay well for working.

Sierra.

STRUCK THE PAY CHIMNEY.—*Tribune*, Aug. 2: Another contract to run 100 feet farther on the ledge was let last week by the San Luis Mining Co. of this place. No sooner had the party started at work on their contract than they encountered the pay chute, which has caused all the stockholders to feel jubilant. John Rose went up to the mine Tuesday and brought down some of the rock with him. He pounded it up in a mortar in the evening and obtained very large prospects. The lower tunnel is now in 1000 feet, and this is the first time that pay ore has been discovered. They felt confident that the pay chute would be found by running the tunnel ahead, and their labors were well rewarded by encountering the well-defined pay chute as given above last Monday. The company has spent over $12,000 in developing the mine, and it now looks as though they might receive good interest on their money.

GOLD BLUFF.—*Mt. Messenger*, Aug. 3: Work at the Gold Bluff is progressing slowly. It will take two weeks more to finish the pipe, which is being made by J. W. Brown. We learn that the Happy Hollow drift mine at Port Wine is paying finely. The Riffle mine between Port Wine and St. Louis is yielding nicely. The Excelsior Drift Mining Co., near St. Louis, has a tunnel in 913 feet and will raise a shaft when the thousand-foot mark is reached. The San Luis Quartz Co. have struck the ledge in their tunnel on the south side of the river and about a mile below Sierra City. The strike has caused quite an excitement at Sierra City.

HOG CANYON ITEMS.—The Primrose mine owners, Messrs. Omsly and Pearson, have arrived here to put into shape and start up this formerly well-known mine. Mr. Omsly will be superintendent. I believe he had charge of it once before, and he is a pleasant, energetic gentleman, and after about one month's repairing will put on a force of men to thoroughly develop the property that many years back produced as much as $200,000. The owners will survey their several claims this summer and fall besides pushing the workings in the mine ahead. The Colombo mine and mill are running full force. It is reported that they have good milling rock and fine prospects. Parties from San Francisco and owners of the Buffalo mine are having the rock tested below, and if the results are satisfactory will try to get a controlling interest and pay off the debts and run the mine on a different process. All the recent workmen and practical miners have the greatest faith that the property can yet be made to pay handsomely. There are two different quartz-mills going up in the vicinity of Gold valley.

Siskiyou.

QUARTZ MINES.—Yreka *Journal*, Aug. 1: The Gold Run mine at Know Nothing creek, in this county, owned by Radelfinger & Dannenbrink, is one of the best-paying ledges in Siskiyou, but the mill is now idle from lack of water to turn the wheel. On first tapping the ledge last spring, in their tunnel, they realized $6000 from 23 tons of quartz taken out, and from 300 tons taken out since realized over $29,000. They started below last week to procure additional machinery and extras for their mill to get it in good order for winter. Bennett & Co. are running their mill on Know Nothing creek, and realize about $40 to the ton. Charley Abbott is still continuing to take out quartz from his ledge on Greenhorn creek, about two miles from Yreka, and says he intends following quartz mining hereafter, it being the only occupation he has yet made a success in. He has a good ledge. Heckathorn & Co., on Greenhorn, are also taking out very rich quartz, and have one of the finest ledges on the coast, easy to work and full of exceedingly rich streaks. We hear a report of parties considering the matter of organizing an extensive mining corporation for the purpose of tunneling the Humbug mountain range on the west side of Yreka, which is believed to contain numerous rich paying ledges of quartz, with a certainty of also being able to obtain a good supply of flowing water for running mills and for placer mining. The Warren quartz-mill on Yreka flats was shut down last Friday for a cleanup of the quartz from F. J. King's quartz ledge at Spring gulch, north of town, which, it is thought, has paid a good average yield per ton. The Empire quartz mine and mill at Empire Creek, Klamath river, near Honolulu, has been bonded to a Portland company for $10,000, and work will be started up soon in developing it. The prospect for a good ledge being found is very favorable, and the mill is one of the best water-power mills in the county, with Klamath river supply to run it.

DOING WELL.—Yreka *Union*, Aug. 1: Many miners in what may be termed the vicinity of Yreka are not only doing well, considering the peculiar dryness of the season and lack of water, but have splendid future prospects. The same encouraging reports come from many other sections of the county. The fact is there is a large amount of profitable mining to be done yet in Siskiyou. Last week a young son of G. W. Cooper, accompanied by a companion, was out a very little distance from Yreka and in prospecting around he picked up a piece of quartz that showed a large proportion of gold.

San Diego.

HELVETIA.—Julian *Sentinel*, Aug. 3: Murray & Smith are pushing things right along at the Helvetia. The tunnel is 180 feet, with pay ore in sight. Hoisting machinery and a ten-stamp mill will soon be on the ground.

WASHINGTON.—Messrs. Keener & Dilks have completed the work of cleaning out the old shaft at the Washington mine, and are now retimbering the same. It is well to state that the ledge in the bottom of the shaft is just as it has always been represented, "chuck full o' gold." Sheriff McDowell and T. J. Daley, the owners, are expected here daily, when the contract will be let for sinking the shaft 100 feet deeper.

EXTENSION.—Four men are at work trying to develop the extension of the Golden Chariot mine. They are down 40 feet with their shaft, and will soon begin to crosscut. Tommy Roland and Wm. Maher are driving their 300-foot tunnel to tap the Fraction mine. They are in 28 feet with good ground ahead of them.

HIDDEN TREASURE.—D. D. Bailey has commenced operations on the Hidden Treasure mine and says that everything looks well. Sid Wilcox, while prospecting the other day, found a quartz vein which shows considerable free gold.

THE RICHMOND MINE is pushing things lively. They are now in 15 feet with their new tunnel. The tunnel will be run night and day until finished.

THE SOUTH HUBBARD is working, with plenty of good milling ore in sight. The vein is three feet wide and shows considerable free gold.

OWENS.—The work of retimbering the old shaft at the Owens mine is completed, and the miners are now crosscutting for the ledge.

Trinity.

KNOW-NOTHING CREEK.—*Journal*, Aug. 3: Mr. D. Hansen of this place, who is largely interested in the mines in this region, returned from a visit to his property last Monday. He reports everything as progressing satisfactorily with every indication for a good camp. The Gold Run shows good ore, averaging $70 per ton, which is being extracted and put through a four-stamp mill. They are working from two levels and in a short time will open up another level. The water supply by which the mill is run has now run short, but a new ditch is being dug and it is expected that it will furnish enough water to run during the entire season of 1890. The ledge averages about 2½ feet, and the ore is free milling. The Know-Nothing mine is paying very well and the owners feel well satisfied with the outlook for one of the best mines in Northern California. A four-stamp mill is kept running day and night on this property with excellent results. The ore is being extracted on two levels, and, while it is not of the highest grade, it pays steadily, and from it the owners will reap handsome dividends. Mr. Black is an experienced miner and works everything to advantage. The Hansen mine is not fairly developed, but with R. Junkans as superintendent it is being prospected; it will no doubt soon become a paying property. Mr. Hansen informs us that the trail from New River to Know-Nothing Creek is a good one, and that the route via Weaverville, North Fork and New River is the most convenient one by which to reach the mines in the above-named section.

A GOOD CLEANUP.—The superintendent of the Trinity gold mine on Oregon gulch mountain came in from that mine last Monday with two lumps of gold fresh from the retort as fine as we ever saw. These were the result of a short run, but nevertheless it was an average of a little over $500 for each 24 hours that water was on the mine. This is a sample of what could be done with a good supply of water from Rush creek or Stewart's Fork. The owners are well satisfied with their season's work. This is one of the largest mining enterprises in the State and nothing but a limited supply of water has prevented the owners from being millionaires to-day.

THE NORTH STAR. — Arrangements have just been completed for a sale of five-sevenths of the North Star mining property, including ditches and water-right. San Francisco capitalists have taken hold of the property to the extent above mentioned, while Henry Junkans retains two-sevenths interest in the entire property. The mine will be worked under the immediate management of Mr. Junkans, and active operations will begin as soon as possible. A 10-stamp mill will be shipped immediately. Great developments are looked for in East Fork during the present season. Mr. Peterson expects to have his mill running in a few days, and it will be but a short time before the Enterprise company will have their mill running at full speed.

Tuolumne.

POCKET.—Tuolumne *Independent*, July 23: Last week a pocket was struck on J. T. Faxon's mine on Saratoga hill, and 163 ounces taken out, yielding $2934. A small pocket was found some time ago of 45 ounces, valued at $846. Mr. W. C. Oakes is running the mine, and Mr. Faxon gets one-third of the output.

MILL.—On dit, that Mr. Bryant of Boston, Mass., intends to build a mill on the Atlas mine at Jackass Hill. Two men are now prospecting, and the outlook seems to justify the proposed improvement.

SOLD.—It is rumored that the Patterson mine at Tuttletown has been sold, and that the new owners will get to work soon and sink the shaft 400 feet deeper.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Aug. 3: The upraise on the 1465 level still continues in porphyry.

HALE & NORCROSS.—On the 400 level the north raise is up 59 feet. It continues in good ore. On the 500 level an upraise has been started from the face of the east crosscut. It is up 15 feet in ore of good quality. On the 600 level the west drift is out 282 feet, where it reached the west clay wall and was discontinued. A considerable amount of repair work is being done in the mine and in the shaft above the 300 level.

SAVAGE.—The prospecting drift west from the sixth floor is out 50 feet, in porphyry and quartz that give no assays. On the 500 level the drift from the upraise is out 128 feet. The joint west crosscut on the south boundary is out 410 feet, and is nearing the west clay wall. A good deal of repair work is being done and are easing and retimbering the main shaft.

GOULD & CURRY.—West crosscut No. 2 on the 300 level is in a promising mixture of quartz, clay and porphyry. West crosscut No. 1, on the 400 level, is being advanced in a formation of quartz and porphyry that promises well.

BELCHER.—The 1200 south drift is out 240 feet in quartz, showing spots of pay, but low-grade on the average. Have stopped the 200 west crosscut and started an east crosscut from the north drift 30 feet north of the shaft.

CROWN POINT.—The raise above the 350 level is passing through low-grade quartz. The face of the south drift on the 300 level also shows quartz carrying some metal. Other work making fair progress.

CON IMPERIAL.—The north drift on the 300 level is still showing clay and quartz in the face.

The joint Confidence-Challenge and Imperial north drift on the 500 level is now in 30 feet from the Yellow Jacket shaft, 10 feet having been added during the week. The face shows quartz, giving low assays.

CONFIDENCE.—The joint Confidence-Challenge and Imperial north drift on the 500 level is now in 820 feet from the Yellow Jacket shaft, 10 feet having been added during the week. The face shows quartz giving low assays.

CON. CALIFORNIA & VIRGINIA.—The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. Are shipping the usual amount of ore to the mills.

SIERRA NEVADA.—The east drift on the 520 level is still passing through porphyry that contains numerous clay seams and some water.

SEC. BELCHER.—Are now running south on the 1100 level from crosscut to connect with the Overman works to obtain air circulation.

MEXICAN.—On the 1465 level No 1 crosscut is passing through a mixture of porphyry and quartz of a promising appearance.

POTOSI.—The 750 level south drift continues in porphyry and quartz, and the 500 level west crosscut in clay and porphyry.

OVERMAN.—A good deal of prospecting is being done in all parts of the mine, and some paying ore is being encountered.

OCCIDENTAL.—The new mill is doing good work. The usual amount of ore is being extracted from the 300 and 400 levels.

SILVER HILL.—The 800 level northwest and northeast drifts are showing no important change in formation.

UNION CON.—West crosscut No. 2 on the 1465 level is still in a favorable mixture of quartz, clay and porphyry.

NEW YORK CON.—The ore in the upraise above the 800 level is widening and showing improvement in grade.

SCORPION.—The joint Sierra Nevada east drift is out 926 feet. It shows some water at the face.

JUSTICE.—The ore-producing sections are looking well and the mill is kept in constant operation.

BEST & BELCHER.—The usual prospecting work is being done on the 455 and 1000 levels.

YELLOW JACKET.—Are shipping 100 tons of ore per day; average assay, $26 a ton.

BALTIMORE.—Usual progress is made in explorations on the 338 and 225 levels.

CHALLENGE CON.—Work here same as in Confidence and Con. Imperial.

ANDES.—The usual prospecting work is being done in the upper levels.

NORTH OCCIDENTAL.—The usual prospecting work is being done.

ALPHA.—The 500 level west crosscut is still in low-grade quartz.

UTAH.—The north drift on the 600 level is still in vein porphyry.

ALTA.—Mill running on ore from the stopes on the 925 level.

BULLION.—Still exploring the 700 level quartz belt.

BENTON.—Grading a site for a hoisting plant.

Burner District.

SHIPMENT. — Tuscarora *Times-Review*, Aug. 1: Will Strickler came in from Burner district last evening, where he is developing a mining claim. He has good ore, and will make another shipment in a short time.

Galena District.

CHEROKEE.—*Silver State*, Aug. 1: A G. Higbee, who has been prospecting the Cherokee mine at Galena, has developed quite a body of galena ore which assays $150 in silver to the ton. A tunnel has been run on the lead and is in 125 feet and the whole face of it is galena ore.

Pioche District.

THE RAYMOND PUMP.—Pioche *Record*, July 27: The twelve-inch Cornish pump at the Raymond shaft of the Pioche Con. Co.'s works was successfully started Thursday evening at about 7:30 o'clock, and began throwing water from the 1200-foot level. The event, which had been looked for for some time, created as much interest in the general public as when the pump was first operated by the old Raymond & Ely Co. Since the mine closed down under the Raymond & Ely Co. in 1880, no work has been done, and when the present company took hold last January and began vigorous work, it was seen that the shafts from top to bottom, in both compartments, must be overhauled. During the years in which the shafts lay idle heavy caves occurred, tearing out several lifts and two or three hundred feet of the pump column and rods, which, in falling, demolished things generally, and all timber in the shafts was decayed and unsound. Both compartments are now retimbered and cribbed from top to bottom. About 250,000 feet of lumber has been used.

IN THE PUMP COMPARTMENT the work has been finished off in a manner calculated to make it last for many a long year. The plunger pumps originally rested on the shaft timbers and their weight no doubt assisted the several caves which occurred. They were found about the bottom of the shaft. In replacing them they were placed on heavy timbers, set in solid rock, the ends being first tarred. A change which it is believed will materially increase the flow of water and which will undoubtedly reduce wear and tear has been made at the bottom of the shaft. Formerly the rod of the lift pump worked inside the column for 160 feet. The change substitutes a piston on the end of the pump rod, working outside the column through a stuffing-box with a valve-chamber, thus taking the weight off the bucket on the down stroke and increasing the capacity of the pump. The shaft being now open to the 12th or water level, the next step is to free this level of water, when the Black Ledge above the water line can be reached and explored. As soon as possible thereafter the machinery over the back winze will be brought out and overhauled, when the real work of battling with the water will begin and at the point where practical operations in the mine were suspended by the Raymond & Ely Company nearly 10 years ago. The most expensive portion of the work is now regarded as accomplished and thus far about $50,000 have been expended.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Aug. 2: West crosscut, 250-foot level, extended 18 feet, passing through a vein of low-grade ore three feet wide.

COMMONWEALTH.—North drift from west crosscut has been advanced 12 feet; exposing some ore. North drift from north stopes advanced 10 feet, total 45 feet, developing good ore. West drift from same point advanced 27 feet in vein porphyry, with bunches of ore mixed through it. East intermediate drift, top of No. 11 chute, has been advanced 15 feet, following a seam of high-grade ore. East crosscut from No. 14 chute advanced 10 feet. South drift from No. 3 winze advanced 11 feet, total 84 feet, all in the vein, with seams of good ore. North drift from No. 1 winze extended 14 feet; total 119 feet. The stopes throughout the mine continue to look well. Two hundred and twenty-four tons of ore have been sent to the mill, average battery assay $140.47 per ton. Bullion shipped, $12,259.53; bullion on hand, $17,000.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended east nine feet; the face is looking very favorable for ore. East crosscut from the south drift, 100-foot level, extended 16 feet; the face continues in concentrating ore with seams of high-grade mineral.

NORTH BELLE ISLE.—West crosscut from the 300-foot level station extended 27 feet; the face is in favorable-looking ground. The retimbering of the north gangway, same level, has been completed.

NEVADA QUEEN.—South drift from 150-foot level of Commonwealth has been extended nine feet. Some high-grade ore is showing in the face and is looking favorable.

DEL MONTE.—East crosscut from north drift, 100-foot level, extended 10 feet, passing through 10 inches of very high-grade ore. The face is still in low-grade ore.

GRAND PRIZE.—Pump is in position and will be started up the coming week. The reduction of the milling ore now on the surface will be commenced to-day.

NAVAJO.—Upraise from south end, 350-foot level, extended 10 feet, and continues to yield some high-grade ore.

ARIZONA.

MINERAL PARK.—Mohave *Miner*, Aug. 3: Mr. Sherman is taking out rich ore in his reserved stoping ground, and still has a nice body of ore in sight in the Queen Bee. Joe Boland and John Barkel are hard at work on the old La Porte, one-half mile southeast of town. They have large quantities of low-grade ore in sight. Messrs. Maynard, Murphy and Coon have a very flattering prospect on the Sabbath Bell mine, three-quarters of a mile easterly from town and near the Lone Star. The Keystone mill shut down last Sunday night, not for the want of ore, but for the want of mill supplies.

HACKBERRY.—Carey and Merrill have taken out three tons of rich ore from the Jeannette mine. Six men are at work sorting the dump of the Hackberry mine, and claim that they are making good wages and have now a carload about ready for shipment. Wm. Miller and H. W. Hitchcock in sinking a shaft in the Crescent mine 100 feet deep struck an eight-inch streak of ore which will make the Crescent what it was in its palmiest days. The Old Dump mine, southwest of the Old Hackberry, is a new discovery by Henry Munson and George Lockwood. They have taken out a ton of ore which goes 813 ounces.

HENSON & PARK—LESSEES QUEEN BEE.—In the face of the drift 100 feet from the 75-foot shaft they have a fine body of ore which appears to be the richest ever taken from the mine. Very soon the lessees intend putting on a night shift and running the drift in as rapidly as possible. So far the ore has improved in quality and appearance as the drift enters the mountain, and the ore body has widened out with the richer ore.

COLORADO.

TEN STAMPS.—Silverton *Miner*, July 27: Hemphill & Wyman, the leasers of the Mastodon, have ordered a plant of 10 stamps, and the batteries will be set up in the old concentrator up Mastodon gulch. They have an abundance of good milling quartz. The Pyramid this week increased its force by eight men. The water which has caused so much trouble in the shaft is now under control, so that the ore can be readily mined. The streak in the bottom is 18 inches thick. A Cameron six-inch pump has been shipped for the San Juan Chief mine at Mineral Point, and the engine and boiler will be moved from the mill to furnish the power. The mine workings, consisting of 300 feet of shafting and 130 feet of drifting, are full of water, and it is expected to get it clear within two weeks after starting the pump. Wm. Sullivan has made an important strike on the Bandora claim at the head of South Mineral creek. The discovery was made in the contact between the quartzite and lime and independent of the Bandora vein. The ore is found in paying quantities, and brittle silver is scattered plentifully through the rock. This is the first strike on the contact. The lessees of the Caribou mine are now shipping their entire dump to the Durango smelter, and have contracted for the delivery of between 1500 and 1800 tons. The rock is calculated to run $30 to the ton. Dick, Ingersoll & Co., who are located in Icelake basin, have completed their stamp-mill, and it has now been running eight days.

DAKOTA.

PYRITIC SMELTING.—Deadwood *Pioneer*, July 30: The departure of J. K. P. Miller and O. P. Ankeny for the Rapid school of mines on Sunday, revives the statement that a ten-ton stack has been ordered, will be put up at the school of mines, and that a thorough and practical test of the process will be made. A gentleman from Rapid yesterday, stated that he positively knew the stack had been ordered.

KEYSTONE CHLORINATION WORKS.—As stated in Sunday's *Pioneer*, cleanup has commenced at the Keystone chlorination works, Garden City. Col. Keith leaves for Denver in a few days to purchase the rolls of which mention was made and which will be substituted for stamps.

IRON HILL.—Everything is in readiness to begin ore treatment at the smelter. Fires were lighted and furnaces dried some days ago. Steam is up at present. Five men were at work Sunday and more went over yesterday. Though it is announced the run will be brief, probably not to exceed 10 or 12 days, the public nevertheless looks for important results in the amount of bullion produced.

IDAHO.

VREKA DISTRICT.—Wardner *News*, July 27. The addition to the concentrating-mill of the Emma & Last Chance Co. is now in course of erection, and when finished will form an extension of the main building, measuring 24x56 feet. The Pelton water wheel will be in place next week.

TYLER.—Another mine on the famous mineral belt surrounding Wardner will soon again wheel into line as a producer by furnishing its quota of ore to the mill and concentrates for transportation. The Tyler mine on which work was closed on June 24, 1888, is again the scene of active operations, and the resumption of work within its limits is but a forerunner of similar demonstrations that will soon be visible on numberless locations in a surrounding distance of several miles.

DEADWOOD GULCH.—The hoisting works at the Inez mine are now in complete running order and meeting all expectations. The plant is 80-horse power, is sufficient to hoist from a depth of 1000 feet and is the most effective and complete piece of machinery of the kind yet imported here. The work of sinking on the Inez is progressing rapidly, and a body of fine ore is exposed in the 100-foot level.

HUNTER DISTRICT.—The flume of the Morning M. Co., at Mullan, was completed on Friday, and the tramway and concentrator will be ready for work in a week or ten days.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, Aug. 5: The news from Alamo this week shows a gratifying energy in business as well as mining. Preparations are being made to move en masse to the new town site, and by the 15th of August the old camp will be deserted. Substantial buildings will be erected at once. There seems to have been some truth in the rumors of a new placer discovery 10 or 15 miles southeast of Alamo. The gold is coarse, like that of Mexican Gulch, but there is not enough of it to justify a rush. Reports come in almost daily of new finds, but no rich placer diggings will be opened until the rainy season sets in, for the scarcity of water precludes working with anything but dry washers, which at best are inexpedient. During the past few days denouncements have been made of a number of leads in the vicinity of Alamo. The work on several mines has been suspended on account of the heat, but on others the development goes right along. The mines of the International Co. will be forced to lie idle until timbers arrive. Percy Douglas is at work with a gang of men clearing the road in Los Cruces canyon. Enough money has been subscribed to pay for clearing the entire road of bad rocks, but more money is needed if grading is attempted.

THE ACCIDENT MINE AT THE REAL.—L. B. Howard, who is in charge of El Accidente mine near Real del Castillo, was here Tuesday, and returned the same day. "The mine is owned and operated by the Occidental Mining Co., composed of D. D. Dare, J. W. Collins and myself," said Mr. Howard to a *Californian* reporter. "We are organized under the laws of California as well as Mexico, and intend to work the mine for all there is in it. Three shifts of men are working night and day, and taking out about 20 tons of rock daily. We have got down 60 feet in the shaft, and have run a tunnel 175 feet besides stoping 60 feet. The men are in ore all the way, as the vein will average between four and five feet. We have leased the old Puebla stamp-mill and are running night and day on $12 to $40 ore, with a capacity of fifteen tons a day. I will be back next week on my way to San Diego with the clean-up."

MONTANA.

FLAT CREEK DISTRICT. — Phillipsburg *Mail*, Aug. 1: The road from the Iron Mountain properties is about completed and will soon be utilized in the transportation of ores and supplies. The road is 11 miles long, and the ore when the end of the road is reached is transported eight miles on a large flatboat by water to Paradise, the shipping point on the Northern Pacific railroad. A Portland company is actively engaged in Spring gulch, distant about six miles from Flat Creek, where they have some good properties. The company is called the King & Queen Mining Co., and development is under the management of Superintendent Jeldness. Quite a stir is going on, we are informed by Mr. Hall, at Trout Creek, where another Portland company is engaged in the development of some good placer ground. They are at present constructing a large bedrock flume, and expect a profitable investment.

GRANITE MOUNTAIN.—The output for the week ending August 1 was 49 bars of bullion, containing 76 288.13 ounces silver and 151.35 ounces gold. The Granite tramway is now running without making any stops for loading buckets. The output of the Drumlummon mine for the month of June was $126,200; working expenses $53,000. St. Louis parties receive about $400,000 monthly from Montana mines; and nearly $14,000,000 have been received during the past four years.

NEW MEXICO.

AN IMPORTANT STRIKE.—Silver City *Enterprise*, Aug. 2: Probably the most important strike made in this section of New Mexico in years has just been made on a claim adjoining the Pacific on the west, and which is under bond to the Pacific people. The strike was made about 100 feet north and 30 feet west of the point where the tunnel cuts the Pacific lead. The ore will average from 42 to 49 inches in width, and runs $25 in gold besides the silver and lead. This same lead crops out on the surface, but is only about 15 inches in width, upon which some surface work has been done. The importance of this strike can hardly be exaggerated, as such an immense body of high-grade ore when properly opened up, will easily produce as much ore as both of the new mills can handle. From all reports of this strike, there need no longer be a doubt as to the future of Pinos Altos camp. The Minnesota crosscut tunnel has intersected the vein of that name. The ore vein is showing well, and the ground now opened will afford an immense amount of stoping reserves which will enrich the plucky little owner and mining man, Harry Fowler. J. D. Smith and J. W. Stone, two well-known mining men, have struck very good ore on Holt creek, in the Mogollon mountains, east of Pleasanton. Paul Curtis, who has been at the Old Man mine for several years, last week sold his half interest in a lease on the property for $1500 and on Monday left for California. The Pacific has been running only a part of the time since it started up, owing to a lack of transportation facilities. The class of ore treated has been of the lowest grade. The *Enterprise* is pleased to note that the shipping of iron ore from this point has again commenced; an average of three cars from the Hanover district is loaded and shipped daily. J. R. Johnson came home on Saturday last with the returns of the ore shipped from the Old Man. The ten tons of ore shipped returned $8435, which is not only gratifying to the lessees, but also shows that a little energy, well directed, is not wasted in this country.

OREGON.

PINE CREEK DISTRICT.—Cor. Bedrock *Democrat*, Aug. 1: Bonanza basin is situated about two miles from Cornucopia in a northwesterly direction. It is a depression in the side of the mountain facing the east and is about three-fourths of a mile across. The elevation above that of Cornucopia—which is 4350 feet above sea level—is from 2000 to 3500 feet. There are at present eight well-defined ledges known to traverse this basin. Upon these eight ledges over 40 locations have been made. As we pass over the "hog back," as it is called, a short distance, we come to the Last Chance mine, a ledge of from 3 to 6 feet wide on the surface and increasing in size as it goes down. The ledge is exposed nearly the entire length of the claim and shows to be a true-fissure vein. Assays run from $90 to $350, and it will mill $150 as the quartz is taken out. There is also a parallel ledge on the same ground that shows up well. The Stella shaft is sunk 25 feet and shows a four-foot vein of $13 rock. The Queen of the West is to the north but a short distance. It is a five-foot vein and the grade of ore is high. The Belcher is to the south of the Stella and shows a ledge of from six to seven feet wide. Assays run from $12 to $60. The Red Boy lies to the north, and a shaft 80 feet deep shows up a strong vein from three to six feet wide. The grade of ore is high and the dump will mill over $100 to the ton. To the east lies the Mountain Chief. This is a bold ledge of from four to eight feet wide and an average sample assays $43.28, a large average for a ledge of this size. The Mammoth lies to the northwest and is a ledge from 10 to 16 feet wide. The pay streak lies upon the footwall and is about six feet wide and samples $29.82. The rest of the ledge being very low grade runs from $4 to $7. The Greenhorn is near the center of the basin and is a well-defined four-foot vein; an average sample assays $120.13. The Star of Texas is high up in the basin and a 20-foot shaft shows a vein 3½ to 4 feet, averaging $38.03. Silver predominates in this ledge. Some of the remaining locations that have a very promising appearance, by showing ledges from two to five feet wide and assaying from $10 to $20, are as follows: Independence, Morning Star, Yukon, Garrison, May Queen, Golden Chest, Climax, Little Joker, Centennial, etc. There is surely a great future for this vast group of ledges. What a splendid opportunity for a company to run a tunnel into the mountain and tap all of these ledges. A tunnel 2000 feet in length would cut these ledges from 2000 to 3000 feet deep.

ASSAY OF BLACK SAND.—J. H. Fisk in *Oregonian*, Aug. 3: In the *Oregonian* of to-day I notice an inquiry as to the average "Assay of gold in black sand" from the coast of Oregon. I presume you wish to know the average assay of the black sand for the gold it contains, and not the assay fineness of the gold after separation. In answer, I beg to say that I have made many assays of the black sand in the past 20 years, and it is very difficult to say what the average value of the sand is in gold, for in many places it contains no gold at all. Near the mouth of the Coquille river, and at Cape Blanco and Port Orford, when the tide is low, the black sand is found near the surf, several inches in thickness, very rich in gold and platinum. This sand will assay from $10 to $50 per ton. Again, back in the interior, up on the Mackenzie river at Mackenzie's bridge, there is about six inches of this black sand which is very rich in both gold and platinum. This sand is composed mostly of titanum or titanite of iron.

UTAH.

ORE AND BULLION.—Park City Cor. Salt Lake *Tribune*, Aug. 4: Bullion shipments: July 28, 15 bars Ontario, 8559 ounces; August 3, 15 bars Ontario, 8540 ounces; August 1, 18 bars Daly, 19,736 ounces. Received at Park City sampler for week ending August 2; 639,050 lbs. Ontario ore; 218,300 lbs. Daly ore; 38,550 lbs Jupiter ore; 227,200 lbs. Mayflower ore; 124,250 lbs. Union concentrates; 79,300 lbs. Woodside ore. The Crescent Co. shipped during the week 90,000 lbs. of concentrates. The long-delayed boring machine for the Anchor shaft arrived here this week, and is in position, and in a day or two operations will be commenced. Messrs. William H. Bennett and Cornelius Hunt sold out their interest in the Mayflower lease this week to Salt Lake parties. The price received is said to have been $8000 each.

STRIKES REPORTED.—During the past week a rich strike was reported on the Wasatch mine which is being worked on a lease. An assay made shows the ore to go 89 ounces in silver and about 10 per cent in lead. The fortunate lessees are James McCune, E. C. Williamson and John Farrish. The announcement of a big strike in the Comstock mine on Tuesday was the all-absorbing topic in mining circles during the week. A visit to the mine showed the report to be well founded. The vein is a true fissure vein between well-defined walls of porphyry and quartzite. When first struck the vein was only six inches wide, but in drifting about 25 feet the ledge has widened to 6½ feet. The pay streak is about 2 to 2½ feet, the ore being galena and carbonate. The vein was cut in the lower tunnel at a depth of about 100 feet from the surface. Preparations are being made to put the property in good shape for shipping ore.

MECHANICAL PROGRESS.

The Superiority of American Hardware.

There is probably no line of business in which American skill has been more prominently displayed than in the manufacture of hardware. It is in fact an embodiment in many ways of the genius of our people. We do not now so particularly speak of the numerous inventions, but more especially in a general way of the greater excellence of American hardware as compared with the foreign product.

In beauty of finish, in attractiveness of appearance and in enduring quality the American edge-tools are the best in the world. Retail hardware shops in London make a specialty of them, and advertise them as a means of drawing custom.

In Australia we compete successfully with England in every variety of hardware. Our cast-iron locks are fast taking the place of the heavy wrought English article, while our axes are notably the finest that are made, and the export trade is a very important consideration with Eastern ax-makers.

Our saws have gone around the world. They are to be found in Africa, India, South America and the continent of Europe. We sell shelf hardware all through France and Germany, because it is not only cheaper, but better than anything they can produce at home.

It has been about conclusively established that our machine-made files will do nearly, if not quite as much, work as the foreign hand-cut file at a cost of half as much.

The export trade on steel goods has grown to great proportions, because no other country makes anything as well adapted to the purpose for which they are required.

Augers, bits and such boring tools are models of beauty and perfection. We actually export such heavy goods as carriage and tire bolts to Africa and Old Mexico, South America and Australia, where we come in direct competition with German and English manufacturers. We might go on enumerating did space permit, but suffice it to say that almost every Eastern manufacturer of note is experiencing a constantly growing demand from abroad for his goods, because where they have been once introduced the consumer will not be content with an inferior article.—*Age of Steel.*

MORE EXPERIMENTS WITH POWDERED COAL. Erastus Wiman and others are experimenting with a new process of heating iron with powdered coal instead of natural gas. The experiments are being conducted at the Vesuvius Iron Works, Pittsburg, and are said to be satisfactory. Speaking of the test, Mr. Wiman said: "It is as yet rather limited in its scope, but eminently satisfactory in its results. One heat consumed 684 pounds of pulverized coal. The quantity of iron heated by that quantity of fuel was 4600 pounds. We are confident, from the present results, that we can heat iron at 50 cents per ton, including the cost of pulverized coal, while the existing rates for natural gas at the different mills make the cost of heating iron upward of $1 per ton. While a contrast test was not attempted, the lack of facilities necessary for the perfect operation of the new experiment rendered the test successful in only a limited degree, but sufficient to prove that we can produce the same quantity of iron with the pulverized coal process in an hour as the natural gas facilities at present afforded can produce in two hours. Of course, while the tests thus far have proven satisfactory, unforeseen difficulties may arise in the future, although we feel confident of ultimate success in a very short time." The tests will be continued in order to remove all doubts as to the success or failure of the plan.

IMPROVEMENTS IN MECHANISM.—The progress constantly made in all branches of human industry is so rapid that it is often difficult to realize how much better equipped for the struggles of life people are now than they were 25 or even 10 years ago. There are, of course, many improvements that instantly occur to every one, but the strides made in some of the minor conveniences of life have been equally wonderful. In nothing has this constant improvement in any given specimen of mechanism been more apparent than in the sewing machine. The large and universal demand for such machines and the constant rivalry which has been kept up has stimulated to the utmost the different inventors and makers in this now indispensable article of domestic use. When it is understood that no less than 8,000,000 of these machines have been made and sold, one may readily realize the important part they form in the labor of the world.

PATENT YOUR INVENTIONS.—A dispatch from Findlay, Ohio, states that on July 12th F. J. Seymour, manager of the American Aluminum Company, died suddenly of paralysis. The deceased some four years ago secured patents covering a process for manufacturing aluminum. He had little difficulty in inducing capital to take hold of the enterprise, and the American Aluminum Company was organized, with Gen. Russell A. Alger as president, Senator Palmer of Michigan vice-president, and other stockholders of wealth, including Senator McMillan of Michigan, Mr. Peters of Saginaw, Michigan, and Col. E. A. Wood of Cincinnati. Just at that time the discovery of natural gas in Ohio was attracting national attention, and in order to utilize the steady and intense heat produced by it the laboratories of the company were established at Findlay. Expensive retorts and valuable machinery were constructed, and the manufacture was begun on a large scale and proved so successful that great quantities of the metal were placed upon the market at prices that gave large profits on the investment. The process, although patented in nearly all of its points, has been kept a religious secret, and no one has ever been permitted to penetrate the mysteries surrounding it. A 15-foot picket fence surrounds the buildings, with its gates doubly padlocked, while vigilant employes constantly guard the single door to the establishment. The secret of the process has been buried with Mr. Seymour. It was his invariable custom to await the critical moment in his work and then all the employes were excluded from the room, and alone he went through the processes which he never explained. The stockholders of the company are undetermined what to do under the circumstances in which they are placed, but will probably give some of their chemists full scope to rediscover the lost secret. The Aluminum Product Company of New York had purchased a rolling-mill at Findlay and were preparing to utilize the products of the other company by manufacturing valuable alloys, but it is feared that the project will now have to be abandoned.

CHILLED SLIDE VALVES.—We learn from *L'Ingenieur-Conseil* that M. Bollinckx is casting the valves of Rider engines in a mold which chills the faces. The chill penetrates to a depth of one-sixth to one-fifth inch. As the surface cannot be cut with a tool, it is ground with emery rollers until a perfectly true and polished face is obtained. It is claimed that not only do these surfaces not wear, but that, thanks to their exceeding smoothness, they do not wear the faces on which they work. Further, the coefficient of friction is naturally very small. The administration of the State railways has sent a representative to examine the application of the mode of construction to the slide valves of locomotives. Of course there is nothing novel in the idea of chilling a slide valve face. The plan has already been tried in this country and with a considerable amount of success. It needs, however, a very long time to demonstrate the advantages of a particular construction of slide valves.

COPPER STEAM PIPE.—The manufacture of steam pipes of copper, of comparative recent development, has been attended with results not more gratifying than invaluable. Their production is by means of electro deposition from sulphate of copper solution, the pipe being formed on an iron core in the depositing bath, and the copper deposited being pressed by a moving tool during the process of deposition, thus giving a fibrous strength to the crystalline copper. The shell or pipe is subjected to hot steam which separates it from the core also expanding the shell, and rendering it a marketable commodity. The pipe is without joints and has been found capable of very high resistance. —*Industrial World.*

AN IMMENSE GLASS GLOBE OR BUBBLE.—In the French crystal department at the Paris Exposition is an enormous glass bubble perched on a stand like the world on the back of Atlas. Its diameter is 1 meter 55 centimeters, and its volume 1950 imperial quarts. It weighs 22 kilograms. For the information of the general public who prefer to understand these things from a material point of view, we are informed that it is capable of holding nine casks of wine. It is said it has never been equaled in the history of glass-blowing. The bubble is pure as crystal and without the slightest blemish.

IMPENETRABLE SHIP PLATES.—The British naval authorities believe they have secured plates absolutely impenetrable by missiles hurled by any great gun at present invented. The discoverers of the secret are said to be two well-known firms—John Brown & Co. and the Beardmore Co.—who are each casting a steel plate by the new process, 10 inches thick, for experimental purposes. They profess themselves as perfectly confident as to the ultimate result of the test, which will be of an unusually exhaustive character, and take place at Portsmouth.

WOOD PULP GASKETS.—Attention is called to the employment in France, for steam and water-pipe joints, of gaskets made of wood pulp, which are claimed to be more economical than the ordinary rubber gaskets, and are not subject to decomposition by high temperatures. Care is taken in the preparation of the pulp to select woods free from ingredients which might attack metals. The compressed pulp gaskets are boiled in linseed oil, and in practical use have given, it is said, very satisfactory results. —*Iron and Steel Trades Review.*

COST OF STEAM AND WATER-POWER.—An elaborate article on this subject, based on actual work at a woolen-mill on the Merrimac river, may be condensed into the statement that the steam-power at that locality gave a total cost per horse-power of $52.50, against $19.24 for the water-power.

WIRE-RIMMED FLY-WHEELS.—Fly-wheels with rims of steel wire are now made in Westphalia, and may be run at three times the speed of cast-iron wheels, which are limited to about 40 yards per second for the rim.

SCIENTIFIC PROGRESS.

The Influence of Sunlight on Trees.

In the latest report of the head of the Forestry Department of the United States, reference is made to the effect of light on the growth of various trees. It is well known, says Prof. Fernow, that light is necessary for the development of chlorophyll, and, therefore, for the life of all green plants, and especially for that of trees. The heat alone, which accompanies the light, is not sufficient, although the relative influence of the light and the heat on the growth is still an open question, as well as the relative requirements of light on different species of trees. In the case of forest weeds, which in forestry serve as an indication of the amount of shade which the trees exert, and with their capacity of impeding evaporation, some require full sunlight for their development, others are averse to a high degree of light. To this must be due the change in the plants of a district when its forests are removed. Then the amount of shade needed is modified by site. Where the sunlight is strong, in higher altitudes, drier climates, or where the growing season is longer, or there are more sunny days, some species will endure more shade. The flora of high altitudes in general requires light.

Trees nearly always develop best, in other words, make most wood, in the full enjoyment of light, but their capacity of developing under shade varies greatly. The yew will thrive in the densest shade, while a few years overtopping kills the larch; the beech will grow with considerable energy under partial shade, where the oak would only just keep alive, and the birch would die. When planted in moist places all species are less sensitive to the withdrawal of light. In the open, maples, elms, sycamores, and others, grow well and make good shade trees; in a dense forest they thin out and have but scanty foliage. Conifers, such as spruces and firs, which preserve the foliage of several years, have, perhaps, the greatest capacity of growing under shade and preserving their foliage in spite of the withdrawal of light.

In America sufficient data to group the forest trees according to the amount of light required by them, have not yet been collected, but rules based on experience have been formed in Germany, where the behavior of trees under different conditions of light has been carefully studied. It has been found, for instance, that on the same branch, those leaves which are developed under the full influence of sunlight are not only larger and often tougher in texture, and thicker, but that they have a larger number of stomata or breathing pores than those less exposed to light. The whole subject is one of the utmost importance in forestry, and observations and experiments are to be carried out in regard to it in the United States.—*Builder and Woodworker.*

MEN WHO ARE NOT FIREMAKERS.—There are but few, even of the most rude and savage tribes of men, who are not acquainted with some mode of producing fire. Such, however, have sometimes been met with by travelers, and Dr. Finsch has recently met with such a people in New Guinea. He says that the people in the large villages that are buried in the forests along the shores of Astrolabe bay know of no means by which they can produce fire. It is therefore a duty devolving upon every member of the community to aid in preserving fire. All their cooking is done outside their huts in the open air, but in the center of each hut is a fireplace, and it is a crime to permit the fire to go out. Dr. Finsch asked the natives if they never lost their fire. He was told that such a calamity had occurred, and that they would never have had fire again if it had not been for a very fortunate circumstance. They know a tribe in the mountains away from the sea who possess the art of making fire, which they guard as a secret. One time the people were compelled to go to these firemakers for the spark that would rekindle the dead embers in their huts. They carried the fire for many miles. They were determined never again to be reduced to this necessity, though it made them feel very comfortable to think that they knew where to get fresh fire if they lost their own. It is to be presumed that these simple-minded natives have now ceased to guard the smoldering embers in their huts with such jealous care. A white man has been among them—one of the sort who brings blessings instead of evils in his train, and they know now that even if they never see a white man and the wonderful little fire sticks he carried with him again, they can, with the aid of friction and tinder, be their own firemakers.

A CYCLONE.—Cyclones appear to be more frequent and destructive than formerly in this country; but it is probably only in appearance, as there are more people in the country and more improvements to be disturbed by them, and more newspapers to bring the facts before the people, than in former times. That probably makes the difference between then and now. No way has yet been discovered of securing immunity against these dreadful cyclones which sweep across the plains and prairies of the West with irresistible force, says a cotemporary. No structure of human hands appears to be able to withstand their onslaught. Houses and barns are swept away like stubble before them, and the path of a cyclone is marked by general ruin and devastation. No preventive measures can turn them aside from their chosen way, and no shelter is availing which presents any surface to their fierce attack. Modern meteorological science can assign general reasons for their appearance, and can explain their nature and phenomena. They are known to be storms of wind moving in immense spirals or whirls precisely like the little whirls of dust we so often see on a warm summer day. But then larger whirls sweep onward over vast areas of the earth. They are usually from 200 to 300 miles in diameter, and sometimes much more. Their central point is calm, and this moves forward at the rate of from 2 to 40 miles an hour. These storms originate outside the equatorial belt between the tropics and move toward the poles. If there can be imagined a gigantic pegtop of wind, whirling rapidly on its peg and at the same time moving forward, an idea will be gained in a rude way of a cyclone. These storms in the Northern Hemisphere revolve from right to left; in the Southern, from left to right.

A Comet Falling to Pieces.

Prof. E. S. Holden of the Lick Observatory has furnished some interesting facts in regard to the comet recently discovered by Prof. Barnard. He says that the following facts may be deduced from observations recently made: The comet, which is now a long way past its perihelion, has lost all signs of the tail which it had when nearest the sun. No doubt the effect of the sun's action upon the head of the comet has become so small at its present distance (253,000,000 miles), that the head is no longer forced to give out those streams of matter which showed to us the comet's tail. But the comet was subject to immense strains and stresses in passing through that part of its orbit nearest the sun, and it is now showing the effect of these forces in the following ways: Its body is evidently becoming disintegrated and the fragments are seen to be streaming behind the comet in the form of a tail directed, not from but toward the sun. This mass of matter was measured by Mr. Barnard July 16th, and this measurement shows its least possible length is 4,300,000 miles and least possible diameter is 144,000 miles, so that the fragments which have already broken off from this comet fill a cubic contents of at least seventy thousand millions of millions of cubic miles. That is seven followed by 16 ciphers. The comet itself, which is 165,000,000 miles from the earth, is still fairly bright, and were it not for the fragments which are seen to follow it would seem to be in a perfectly normal condition. As it is, we know it must have lost an immense quantity of its original substance. This is an interesting case to astronomers, as it shows almost palpably the effect of the enormous forces to which every comet is subjected at the time of its perihelion passage, and the whole phenomenon forms an interesting commentary on the text that comets, even the stoutest of them, must be but short-lived things.

The reader of the above will, no doubt, be reminded of the fact that the comet, but recently known as Biela's comet, was recently seen to separate into two parts, which gradually receded from each other during two of its revolutions, when it finally appeared to become disintegrated, much as Barnard's comet is now being disintegrated, until it finally disappeared and has probably been lost to view forever.

THE WORLD'S DESERTS VANISHING.—The world is fast losing its deserts. There was a day when the United States had one of no small size, when it was claimed that all the land west of the Missouri river was a barren waste. The farmers of Kansas, Nebraska and Dakota have disposed of much of the great American desert. Once upon a time large portions of the interior of Africa were believed to be arid and uncultivable. Now we learn that they are fruitful and well populated. The interior of Australia has been held up as an awful example of a howling wilderness, destitute of water and of animal or vegetable life. That illusion is now being rapidly dispelled. Recent explorers report that inner Australia is no Saharan waste, and that though uninhabited it can support a large population. There are grassy plains, large lakes, and also traces of gold and precious stones. A north-and-south railway is now building through the center of Australia, and doubtless with its completion the last trace of the desert will vanish. The iron horse is a wonderful dispeller of illusions of that kind. The truth is that there are vast regions on this continent, in Asia and Australia which are barren from the standpoint of primitive and ignorant agriculture, but which, when taken in hand by the educated farmer of today, with his modern implements, blossom like the rose.—*Chicago Tribune.*

THE ADVANTAGES OF A DARK SKIN.—A scientist has discovered the advantage of a dark skin as a veil against the heat in hot climates. The carbon layer in the skin of the negro, being opaque, like other forms of carbon, must form an effectual veil, and thus protect that most important organ below the true skin; a bodily envelope or tissue presenting a vast surface of circulating blood, which is certainly subject to brilliant illumination when only protected from sunlight by the thin translucent cuticle.

Good Health.

Death From Trichinæ.

Joseph Palmi, a laborer, died at Bellevue hospital, New York, of that fortunately rare, but extremely painful, disease, trichiniasis. This disease may be described to the non-technical reader as the propagation and infinite multiplication of minute living worms in the muscles of the entire system. It usually arises from the incautious use of raw or partially cooked pork.

According to the New York *World*, he was at first supposed to be suffering from inflammatory rheumatism when brought to the hospital, but from the description of the approach of the symptoms, the resident physician decided that it must be trichiniasis. Palmi at first denied that he had been eating pork, but finally admitted that about a week before the pains appeared he had purchased some pig's feet of a butcher on Mulberry street, near his residence. His wife and children had eaten the food with him.

The man suffered terribly, and the physician was compelled to administer opiates, both internally and hypodermically, to ease the excruciating pain caused by the myriads of worms invading every muscle of his writhing body. Though the patient was able to take slight nourishment, he continued to grow weaker day after day, until death finally put an end to his sufferings.

Said Dr. Williams yesterday: "I have no doubt that the case is one of trichiniasis. Palmi must have eaten other kinds of pork, for pig's feet contain very little muscle, being principally composed of tendons, cartilage and gelatinous matter. His wife had a slight attack of abdominal spasms, which are the first symptoms of the disease. She, however, seems to have recovered, though I should not be surprised if the woman was brought here in the same state as her husband was. Trichiniasis consists of the breeding of minute worms in the muscles, and they go on multiplying until the entire system is filled with them. Being in the muscles of the pork, which has not been submitted to a heat of 255 degrees to kill the worms, they are taken into the stomach. Here they begin increasing and produce the abdominal spasms which are the initial symptoms; then, following the intestinal track, they finally pass through the abdominal walls, and so enter the lymphatic organs. From that moment the patient is doomed, unless he is so constituted that his system can resist the trichinæ when they become incysted and die. If they are too strong for resistance they go on living in the muscles until the latter decompose and death ensues very quickly.

"When Palmi was first brought here I took a piece of muscle from his forearm and discovered that he had previously suffered from the disease, because there were incysted worms visible in it. One of the symptoms is an intense thirst and agonizing pain, both of which were present in this case. Usually trichiniasis is developed from pork which is eaten raw, and people frequently have it who are in the habit of eating raw Westphalia hams and bologna sausage. But pork is not the only meat which is capable of developing trichinæ, for they are found in the muscles of dogs and cats, rats and mice, and even moles, all of which animals eat pork. The origin of trichinæ is unknown, and they may be inherited for all we know."—*Ex.*

The Ten Health Commandments.

1. Thou shalt have no other food than at meal-time.

2. Thou shalt not make unto thee any pies, or put into pastry the likeness of anything that is in the heavens above or in the waters under the earth. Thou shalt not fall to eating it, or trying to digest it. For the dyspepsia will be visited upon the children to the third and fourth generation of them that eat pie; and long life and vigor upon those that live prudently and keep the laws of health.

3. Remember thy bread to bake it well; for he will not be kept sound that eateth his bread as dough.

4. Thou shalt not indulge sorrow or borrow anxiety in vain.

5. Six days shalt thou wash and keep thyself clean, and the seventh thou shalt take a great bath, thou and thy son, and thy daughter, and thy man-servant, and thy maid-servant, and the stranger that is within thy gates. For in six days man sweats and gathers filth and bacteria enough for disease, wherefore the Lord has blessed the bathtub and hallowed it.

6. Remember thy sitting-room and bedchamber to keep them ventilated, that thy days may be long in the land which the Lord thy God giveth thee.

7. Thou shalt not eat hot biscuit.

8. Thou shalt not eat thy meat fried.

9. Thou shalt not swallow thy food unchewed, or highly spiced, or just before hard work, or just after it.

10. Thou shalt not keep late hours in thy neighbor's house, nor with thy neighbor's cards, nor his glass, nor anything that is his. —*New England Farmer.*

Another "Cure" for Insomnia.—Dr. Theodore B. Lyman recently wrote as follows: I think I have a very valuable discovery. For nearly two years I have been suffering greatly from sleeplessness at night, and frequently have not been able to sleep more than one or two hours during the night. A little more than a fortnight ago, while staying at the house of a friend, my good hostess brought into the parlor, quite late in the evening, a bountiful supply of freshly roasted peanuts. As I am very fond of them, when they are not too much cooked, I ate quite freely of them, and soon after retired to bed. I found the next morning that I had enjoyed the best sleep that I had experienced for over a month. I attributed this at once to the peanuts, and tried them again the following evening. I also drank a glass of fresh, sweet milk, after I had finished the peanuts. That night I slept still better, and, now, for a fortnight, I have partaken of the peanuts and milk every night, and not only have slept remarkably well, but have also fully recovered from a slight attack of indigestion. I now find that peanuts, carefully roasted and not overdone, so as to be at all burnt, are a sure remedy for sleeplessness, and also for that form of indigestion which produces sleeplessness.

Fatal Snake Bites.—The editor of the Savannah *Morning News* says: "Out of a thousand people bitten by rattlesnakes I do not think a dozen recover. There is no known cure, in spite of the fact that many people have said that they were cured by whisky. You may depend on it, that when a man says he was cured of a rattlesnake bite, though not necessarily a prevaricator, he is at least laboring under a misapprehension of the facts. There is a small snake similar to the rattlesnake in appearance, whose poison is not so venomous, and negroes bitten by it place lime upon the spot or else drink enough whisky to counteract the poison. Whisky, if taken in a large quantity, goes directly into the blood and counteracts the poison of the snake. But the regular Georgia rattler, from five to seven feet in length, is a deadly customer to meet. It does not give any warning, but strikes the moment it is disturbed, and it can strike an object as far distant as it is long. A friend of mine was riding along in the saddle one day, and a big rattler lying in the road leaped at him as he passed. It closed to his bootleg, driving one of its fangs clear through the thick leather of his boot and through his trousers, just escaping the flesh. It required considerable kicking to shake that snake off, and when he was finally got rid of he started in pursuit. My friend faced bullets in the army with nonchalance, but his hair stood on end when he saw that snake coming, and he jammed spurs to his nag and didn't stop until he had gone a quarter-stretch. My plantation is full of rattlesnakes, and only last week my hands killed 26 in a field of 20 acres."

A Fatal Kiss.—Mrs. Lena Rochler of New Haven died on Saturday, July 6th, of diphtheria, which she took from her little girl, who died of the same disease a week ago. The infection is attributed to her kissing the child, contrary to the orders of the physician.—*Boston Journal, July 10th.*

Useful Information.

Something About Fleas.

There are several varieties of the flea family. There is the human flea, the cat flea, the dog flea, the chicken flea and the pigeon flea. Each has a complete outfit of mandibles, lances, etc., which completely fits them for their conditions of life. It is said that most insects are entirely destitute of physical and mental powers, but this is certainly not true of the flea, otherwise abominable and disgusting as it may be.

Ordinary observation teaches us that the flea is possessed of most remarkable physical powers, extraordinary strength and agility—such in fact as enables them to make leaps of a thousand or fifteen hundred times their own length. If a man could perform a proportional leap, he would be able to scale a high mountain with only two or three bounds. In regard to mental powers, close observation has shown us that the flea possesses at least maternal affection in a very high degree. A writer on natural history says: "Fleas have a tender and provident affection for their young. Their eggs are frequently placed in the cracks of floors or in the crevices and corners of furniture, and almost always side by side with the eggs may be found small granulations which, when examined with the microscope, are seen to be specks of desiccated blood, so that the young flea when it enters into life will find its favorite provision ready for its use."

The flea, as everybody knows, is endowed from its very birth with a most voracious appetite, hence this first stock is soon exhausted. But the mother, if spared the human thumb, is closely on the watch, and at the proper time brings to her offspring the blood with which she has gorged herself from some other living creature and feeds it out much in the same way as pigeons give beakseful of food to their little ones.

The same author as above quoted, in consideration of these facts, exclaims: "Kind fleas! honorable fleas! Nothing less than this could have made me respect them. I make my bow, and out of respect for their good feelings I pardon them for the injuries they inflict on me."

From the above it may be charitably supposed that these degraded and despised insects are not half as bad as uninstructed people generally suppose them to be. They simply prey upon man and other animals as they prey upon each other.

> "So, naturalists observe, a flea
> Has smaller fleas that on him prey;
> And these have smaller still to bite 'em
> And so proceed *ad infinitum*."

"Limited" Corporations.

It has become somewhat common now-a-days to see the word "limited," in parenthesis, after the titles of corporations, and it is safe to say that people generally do not understand the significance of the term, though, of course, business men do. An explanation of it may, therefore, be of general interest. The old principle of corporations, created by legislative Act, was that the entire property of every stockholder was liable for the whole of the company, as the whole property of every member of a general partnership is still liable for the debts of the firm. This system made every shareholder responsible for bad management, of which he might not be guilty, and deterred wealthy men from becoming interested in the shares of corporations. To remove this objection the principle of limited responsibility was introduced, and in order to notify the public that only the separate property of the corporation was liable for the debts of the corporation, the English law requires that the word "limited" shall be used in every case by the company in connection with its title.

Most American corporations are constituted on the principle of limited liability; but few, if any, of the States enjoin the companies formed under their laws to append the word "limited" to their corporate titles. The matter is so generally understood in this country by business men, however, that it is not deemed necessary, though many companies do it of their own accord. The most noteworthy exception to the general rule is the case of the national bank, but even in this instance liability is limited to an amount equal to the par value of the shares held; that is, if the national bank fails, each stockholder may not only lose what he has invested, but $100 more for each share of the stock he holds, if so much is necessary to pay the debts of the bank.

Until within a few years all the Scottish banks were organized with unlimited liability, and when, some eight or ten years ago, a Glasgow bank failed disastrously, there were cases of men who only owned a share or two, valued before the failure at not much more than $100, who were assessed thousands of pounds sterling to meet the debts of the bank. Since that time the Scottish banks have been allowed to reorganize on a limited liability basis.—*Ex.*

How Creosote Affects Chimney Flues.—Attention has more than once been called to the peculiarly corrosive, and consequently destructive, effects of the creosote of wood soot upon chimneys, owing to the fact that the creosote thus formed from the slow combustion of wood contains so large a proportion of pyroligneous vinegar or crude acetic acid; this acid being formed in large quantities when the combustion of wood is slow, many quarts, in fact, being condensed in cold weather where a large wood fire is very much checked, only a few hours being required for such condensation. The acid in question dissolves lime readily, carrying it away in solution, and in this manner the mortar is frequently entirely removed from the tops of chimneys in the country, new ones suffering in the same way as the old, instances being numerous where the top courses of bricks in chimneys only two years old have become entirely without support other than that afforded by the sand with which the lime was mixed.—*Am. Gas Light Journal.*

Terra-Cotta Works at Vallejo.—Terra-cotta and brick works have recently been established at Vallejo. The works are not complete in all the departments, but, says an exchange, the work of making the "clay shale" into building material is progressing nicely. Only two machines are working at present, the other four being in course of construction, and as soon as they are ready for operation the force of workmen will be increased. Tons of the selected "clay shale" has been gathered, and is being broken up to the required size for the crusher. In a test recently the brick stood a pressure of 16,500 pounds, and only resulted in chipping the corners, and this would not have happened had the machine been perfect. With the two machines running 50 men find employment. The making of terra-cotta has not been started on yet, the chief aim being to fill orders for building and ornamental brick.

Silk Direct from the Mulberry Leaf.—One reads and hears of a great many wonderful inventions now-a-days, and consequently is not much surprised at anything, but it is doubtful if anybody can be found who will take the following statement without some allowances: "It is reported that a process has been invented for extracting silk fiber from the mulberry leaf without the intervention of the silkworm. The quality of the silk obtained is declared to be equal to the best silkworm product. It is an American invention, and if successful, as is anticipated, will work a revolution in the production of silk."

A New Dog from Holland has a long mane, a short body, a sharp bark, a head like a pig, big ears and no tail. He has appeared at English dog shows, and is fashionable and expensive.

Electricity.

Electro-Therapeutic Spectacles.

The application of electricity is getting to be more and more recognized as beneficial, and electric apparatus of various kinds have been developed and find large sale. The latest invention in this line, and one that seems to be of great benefit, is the application of electricity through the medium of a pair of spectacles. The device is particularly applicable and advantageous in cases of nervous headache, etc.

The frame of the spectacles may be of the usual construction, except that it is preferably made of copper. The arms of the spectacles, at a point somewhat forward of the ears, are formed with vertical open enlargements, somewhat oval in outline. Within these openings are inserted corresponding zinc plates, which, when the spectacles are in position, come in contact with the face rearward from the eyes. Another delicate strip of zinc is attached under the bridge-piece so as to rest upon the nose. The copper spectacle frame may be protected against oxidation by means of a coating of lacquer, varnish, or other suitable composition, applied at any suitable points, as desired.

The operation and advantages of this invention will be readily understood by those skilled in the art to which it appertains. In use, the copper framework of the spectacles and the zinc plates at the ends of the side arms and at the nose-piece will come in contact with the face and head of the wearer, and, owing to the location of the plates at opposite sides of the head, and the relative location of the strip upon the nose-piece, the current of electricity generated by the device in the usual manner will be caused to pass through the head of the wearer.

This invention is particularly valuable, as the spectacles, while performing their usual office, will at the same time be removing the pain in the head and preventing its attack. This is a German invention. The agent in this country is Mr. Alfred Brost of Key West, Fla.

The Future of Electricity.

Thos. A. Edison said in an interview with a reporter of the Pittsburg *Dispatch:*

"You ask me about the future of electricity. It is the coming motive-power. It will be used on all the railroads some day, but the point is to get an economical engine. My theory is to have immense dynamos located all along the line of the road, and have the electricity conveyed from these stationary engines to the locomotives by wires through the rails. For example, I would put two big engines between New York and Philadelphia, and enough power could be furnished to whisk the limited at the rate of 100 miles per hour.

"But this is the point I have been working on for years—to convert heat directly into electricity without the intervention of boilers, steam and all that. What an enormous amount of expense could be saved if this could be done. Think of putting something into the heat of that natural gas fire and making electricity out of it! It can be done. I feel it in my bones, and just now I have a suspicion that I am on the right track, but it is a pesky problem—one that can be worked out only in time.

"I have been experimenting with an electric road in New Jersey. I had rails laid as they put them down on railroads, but the machine would run off the track in going around the curves. I then raised the curve to an angle of 40 degrees and the motor went around all right. It looked as if the engine would topple over, but it didn't. You know in a centrifugal machine you can make a car go clear around a circle in the air without leaving the track."

Cost of Storage-Battery Power.—The following figures are given out by the Julien Electric Traction Co. as actual results attained on the Fourth-avenue surface road, New York City, in running cars with storage batteries. A car can run in actual work 57½ miles without recharging. During 40 days that the car in question had been at work neither batteries nor motors have required attention or expense for repair or renewals. The batteries of one car that had been running since Sept. 3, 1888, were examined on the 8th ult. for the first time, and are stated to be in as good condition as when put in. The cost of motive-power is calculated at $3.10 per car per day of 60 miles. This is the cost of energy at two cents per horse-power, at which it is offered to be supplied by the electric companies, and $700 per annum for maintenance of batteries and motor.

Electrical Transmission of Power.—A large cotton-mill company, located at Manchester, N. H., is going to utilize the transmission of power by electricity as an economical movement. The corporation will use water-power, which they control, which is about one mile from the mill, and which they have been unable to use heretofore. The machinery is so constructed and operated as to light the works as well as to drive them.

The City of Berlin is far ahead of London in telephonic progress, there being 10,000 subscribers. The entire net of wires in the German capital has reached a length of 17,804 kilometers, and the average number of calls amount to 196,691 daily.

TABLE OF CONTENTS.

EDITORIALS.—Connecting the Apron and Battery; 101. Passing Events; Another Phase of the Silver Question; Jacob Price's Patents; Miscellaneous, 108. Quicksilver Condensers, 109. Assay of Coal, 110. Excavator for Auriferous Gravel, 113,
ILLUSTRATIONS.—Apron Arranged for Free Access to Battery; Gravel Lift Closed and Loaded; Gravel Lift Open to Take Load, 101. Plat of the Alameda Mine, Tuolumne Co., 103. Quicksilver Condensers and Drying-Chambers at New Almaden Mines, 109.
MISCELLANEOUS.—Mining-Law Changes; Meadow Lake, 102. Manufacture of Mica; Altitudes, 103.
CORRESPONDENCE.—Tuolumne Mines, 102. The Idaho Gold Region; A Nevada Iron Deposit, 103.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 104-5.
MECHANICAL PROGRESS.—The Superiority of American Hardware; More Experiments with Powdered Coal; Improvements in Mechanism; Patent Your Inventions; Chilled Slide Valves; Copper Steam Pipe; An Immense Glass Globe or Bubble; Impenetrable Ship Plates; Wood Pulp Gaskets; Cost of Steam and Water-Power; Wire Rimmed Fly-Wheels, 106.
SCIENTIFIC PROGRESS.—The Influence of Sunlight on Trees; Men Who are Not Firemakers; A Cyclone; A Comet Failing to Pieces; The World's Deserts Vanishing; The Advantages of a Dark Skin, 106.
GOOD HEALTH.—Death From Trichinæ; The Ten Health Commandments; Another "Cure" for Insomnia; Fatal Snake Bites; A Fatal Kiss, 107.
USEFUL INFORMATION.—Something About Fleas; "Limited" Corporations; How Creosote Affects Chimney Flues; Terra-Cotta Works at Vallejo; Silk Direct from the Mulberry Leaf, 107.
ELECTRICITY.—Electro-Therapeutic Spectacles; The Future of Electricity; Cost of Storage Battery Power; Electrical Transmission of Power, 107.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 116.

Passing Events.

The conflagration at Spokane Falls is the third within a few months in Washington Territory. Seattle, Ellensburg and Spokane Falls have all had most disastrous fires. The last one caused a loss of about $10,000,000. All the business houses, banks, hotels, depots, etc., were destroyed. The water pressure (on the Holly system) was very weak.

As was recently indicated in the PRESS, the United States Court at Carson has confirmed the sale of the Sutro Tunnel property for the sum of $1,325,000 to the Union Trust Company of New York. The sale was made on January 14th, and was made to satisfy a mortgage held by the late Hugh McCalmont, as trustee for English capitalists. The transfer of the property, it is said, will not result in any change in the present management of the tunnel property.

The medical and scientific world is just now greatly interested in Dr. Brown-Sequard's alleged discovery which he calls "elixir of life," by which the reddish fluid obtained from the tissue of sheep is injected into the veins of human beings with the effect of rejuvenation. The subject is being vigorously discussed, some believing it and others totally discrediting the whole story.

The rivers and streams of this State and Nevada are now at a very low stage. Most of the snow on the high Sierras has melted.

There is great dissatisfaction among lead miners over the inaction of the Treasury Department on the subject of duty on silver-lead ores. So much lead is coming in free of duty that it is depressing the home lead industry.

Another Phase of the Silver Question.

The more the conservative but close student of political economy examines into bi-metalism, the more fully must he be convinced that the United States made a serious mistake when it joined in the knightly crusade against silver. As shown in our editorial on the influence of silver on American wheat, the depreciation in the price of that metal since this country in 1873 demonetized it has been over 36 cents an ounce, which has carried the price of American wheat on a gold basis, within the like time, down about 40 per cent. The attitude of the United States toward silver has undoubtedly done more than all else to destroy confidence in its rehabiliment as a metallic currency. This country produces single-handed nearly one-half of the world's annual product of silver, and the fact of its taking action against the metal was sufficient to throw consternation into the camp of its friends. But then this is not all; the United States have great interests at stake in maintaining the value of silver and should not play into the hands of England by aiding in its depreciation. These interests lie in the value of the farm produce we export, which exceeds the value of the produce exports of any three nations. With these well-established facts ever uppermost, can we reasonably expect other nations to take the lead in remonetizing silver when we remain dormant with so great interests at stake? Germany's hatred of France will undoubtedly cause its rulers to make haste slowly in any move looking to the restoration of silver as a metallic currency, while England's interests lie in the direction of keeping down the price of silver. The more silver falls, the sooner will her plan for increasing the exports of wheat and cotton from India be consummated, to the great detriment of those interests in the United States. By undermining through low prices two of the leading farm industries of this country and also one of our leading mining industries, England keeps us from making far more rapid strides in which we would with these leading interests promoted by better prices; and yet our so-called statesmen are so blinded by the allurements of English logic that they do not appear to realize the true situation. If there was anything else wanting to convince the most skeptical of England's fear of this country being its rival, both financially and commercially, it is the fact that her statesmen are doing all in their power to build up Canada, which looms up along our side, by giving it subsidized steam and railroad facilities to win trade that naturally belongs to the United States. That this is no idle fear is shown by England gradually acquiring a firmer hold in the Pacific by annexing small but at present unimportant islands, which in the future can be utilized as coaling stations, or for other purposes as occasion arises.

England's rivalry is not that which is indicative of war, but that of retaining her supremacy in commerce; for in the United States the English statesman sees a rival, which, if not counteracted or forestalled, will win success through that sheer force of Yankee perseverance and undaunted will-power when once aroused to a true realization of the situation.

THE Grass Valley *Union* says: "The snow is all gone from the higher ranges of the Sierras, so that the prospects are that the rivers will yet go lower, and if navigation should fail in the Sacramento itself it will not be surprising. No rise in the streams can be looked for before October."

THE men at the Eureka foundry went on a strike last Saturday night, on account of a difficulty between the molders and the foreman. The latter, Chas. D. Greene, has resigned.

A SAWMILL is being put up at Tableta valley, 20 miles from the Alamo mining camp, Lower California, in the midst of a body of 16,000 acres of pine.

THE National Electric Light Association has adopted a resolution requesting the State of New York to repeal the Electric Execution law.

Jacob Price's Patents.

A Good Record of Important Inventions.

Jacob Price, the San Leandro manufacturer of baling presses, has devised and perfected many important inventions since he first commenced work in his special line. The vertical press, known as the Petaluma hay press, was patented as far back as Sept. 1, 1863. The first improvement devised by him was in the shape of the upper part of the press-box, which was narrowed by the inward inclination of the sides, the object being to discharge the bale readily. He also improved the catches for fastening the doors of the press-box, open or shut, and the arrangement of the levers, chains and pulleys for bringing a gradually cumulative strain on the follower as it approached the end of the stroke.

November 28, 1865, he patented a crushing and baling machine in which a reciprocating motion is imparted to the baling-chamber for the purpose of holding and pressing the sheets of material, the same being crushed by the rollers by means of racks, pinions and other mechanisms connected therewith. Loose rollers are employed for folding and compressing the material after it has passed into the baling-chamber, together with grooves in the peripheries of said rollers, through which the strings, wires, etc., may be placed in binding the bale.

On June 6, 1876, he patented an upright baling press in which he greatly simplified the working or movable parts so they could be quickly operated, and yet provided substantial devices for withstanding wear and tear.

His patent of June 11, 1878, provided a machine for baling hay in which the hay or straw can be fed continuously into one end of the machine, compressed into one single continuous bale as it passes through, and cut off into proper-sized bales at the opposite end, thus forming a continuously operating hay press.

On September 14, 1880, he patented an improvement on a hay baler whereby the hay is pressed into bale in layers by the action of a reciprocating follower operating against a solid fixed head. The patent covered the construction of the parts and certain novel combinations and arrangements.

In the upright press patented July 22, 1884, the bale is formed in a chamber at the top by a succession of charges which enter through an inclined feed-throat or hopper at the bottom of the press, into which the material to be baled is pressed and the hopper closed after each charge is received until it has been forced into the baling chamber by a vertically moving follower. This patent also covers a mechanism for operating the follower, an eccentric of variable power by which the mechanism is operated, retainers by which each charge is held in place while the follower descends for a new charge, and the means by which the horse-power lever may be disconnected from the mechanism by which the follower is moved, so that the latter may descend without stopping the horse or changing the direction of his movement.

The horizontal, double-ended press was patented Dec. 18, 1888. In this the bales are discharged from both ends alternately. This modern press is light, strong and fast. There is a peculiar mechanism by which the follower is given a comparatively rapid speed at the commencement, and the speed becomes slower and the power greater as more compression is needed. The press is now made of steel, and is a great improvement on the old styles.

Mr. Price patented on March 22, 1870, an improvement in gang plows, and Jan. 14, 1879, patented a sulky plow. In the latter the axle has one fixed crank and rigid lever. At the other end is a loose spur-wheel; also, a loose crank, on which revolves a spindle having a pinion engaging a spur-wheel. By a foot lever a brake secures the spur-wheel, when the pinion must travel around it, thus raising the plows by the onward movement of the sulky. The crank-axle and plows may also be raised and locked by the hand lever. The difference in the two cranks levels the frame when one wheel is in the furrow or both on land.

Mr. Price has invented two "carts," the first of which he patented Oct. 16, 1883. In this village cart the improvement consists of a novel construction of the body of the vehicle, and as a means for leveling the same to suit the hight of animals of different sizes which may be used. The second one was patented April 29, 1884. It consists of a frame, the side pieces of which are formed of continuous bars of flanged or angle iron, with lugs for the attachment of the seat or other parts and curved strengthening ribs at the points where bends are made.

Among miscellaneous inventions by Mr. Price is a broadcast sower, patented by himself and others Jan. 3, 1872. This is the combination of a hopper and the seeding mechanism of a broadcast sower with certain levers arranged within reach of the driver, to govern the flow of grain and the operation of the machine. Another seed sower was patented by him May 5, 1885. This patent covered details relating to the regulation of the feed to the base frame of the machine and the manner of its attachment to the wagon and to the gearing devices by which power is transmitted from the wagon to the elevator and distributor. This machine did good work both with regard to the extent of the work in a given time and to its quality with respect to an even distribution.

His excavator and dumping-cart was patented Oct. 17, 1876. It was an improvement on that class of excavating machines on which a number of buckets are formed on the periphery of one of the bearing wheels of a cart, so that the earth which is turned and deposited in the buckets by a plow attachment below the cart body will be lifted into the cart until it is filled. The improvements made the appliance more convenient, effective and ready to operate.

On May 31, 1887, Mr. Price patented his traction engine for use on ordinary roadways or fields. It consists of an engine and boiler mounted on suitable bearings and traction wheels, and an intermittently-oscillating clutch mechanism of peculiar construction by which the reciprocating motion of the engine is transmitted to the driving-wheels, so as to produce a continuous rotary motion of the same without the intervention of gearing; and it also consists in a means for adjusting the transmitted stroke and the consequent power which is applied to drive the engine. The patent also covered many details of construction of the various parts of a road engine.

We have not attempted to give any special details of these patented appliances, but this mere mention of 15 patents taken out since 1860 shows a pretty good record for one California inventor, who is still actively at work.

BULWER CONSOLIDATED SUIT.—From the official statement of the Board of Directors of the Bulwer Consolidated Mining Company regarding the suits between that company and the Standard Consolidated Mining Co., we learn that the former company was confirmed in its title to its several mining locations, viz., Stonewall, Homestake, Ralston No. 1 and Ralston No. 2. From this judgment the Standard Co. has taken an appeal. In the other suit the latter company sued the Bulwer Co. for $20,000 damages, and obtained a verdict in its favor for $3000. The damage suit was grounded on an averment that the Bulwer Co. had extracted ore from the west branch of the West Bullion vein, and also that the company had maliciously and wantonly entered upon and within the limits of its West Bullion location and had blown up and destroyed certain bulkheads and chutes therein. An application for a new trial has been made by the Bulwer Company.

DUTY ON MATTE.—The Treasury Department has modified its ruling in regard to the proper rate of duty on copper contained in the so-called nickel matte so as to provide that the fine copper contained in nickel matte shall be assessed for duty at the rate of 3½ cents per pound under the tariff provision for regulus of copper, in addition to the duty of 15 cents per pound on the nickel contained therein imposed by T. I. 191. The decision was modified upon representations that matte is not an ore, and that matte and regulus of copper are synonymous terms.

IT is stated that the powder companies of this city are about perfecting a pool, by which prices will be advanced.

THE people of St. Helena subscribed $2000 for rebuilding the foundry that was burned down last Friday.

THE output of coal from the Vancouver mine, British Columbia, in July, was 19,000 tons.

Quicksilver Condensers.

In last week's PRESS we gave illustrations of the glass condensers in use at the New Almaden mines. The complete condensation of mercurial fumes in a large way presents many practical difficulties. The quicksilver fumes furnish often less than one per cent, by volume, of the products of combustion with which they are mixed. Even the weight of the quicksilver is inconsiderable, compared with that of the gases which pass through the condensers. The plan, sections and elevation of two condensers in use at New Almaden are shown in Figs. 1, 2 and 3 of the cuts. It will be seen that each condenser is a tall, narrow structure, divided by a vertical partition-wall into two compartments. The fumes enter the condenser near the top, pass down the compartment on that side, and out through the arched passages at the bottom of the partition-wall into the other compartment, up which they pass to be discharged into the next one of the series.

The tops of the condensers are sometimes made of cast-iron plates, which are used as drying floors for damp *tierras;* in other cases they are topped over with arches of brick. The floors as shown in section *CD*, Fig. 2, have a slope of 10° from the center to either end, so as to shed the condensed metal to the drain gutters. The floors are brick, closely laid in the most careful manner, then a layer of cement. A heavy coat of asphalt is laid on this in all but the hottest condensers. Manholes, two feet square, are left in the end-walls near the floor of the condensers, so that they may be cleaned at intervals.

These brick condensers are arranged in a series so that they stand side by side, with an air space between each pair; the ends of all being in the same planes. The drain gutters pass the whole length of the series on both sides, and receive all the quicksilver that flows from the ends of the condensers.

An improved form of brick condenser and drying chamber for *tierras* is shown in Figs. 4, 5, and 6. This forms a part of the condensing system of No. 3 furnace. Here the drying-chamber is provided with shelves, resting on iron crossbars. The tierras lie upon the shelves much as they do in the roasting furnaces. The method of drawing and discharging the ore is evident from the figure. The hot fumes from the furnace pass all around these drying-chambers, thus heating their contents. The steam generated from the moisture in the ore is allowed to escape to the open air through flues built in the hollow wall of the drying-chamber.

The leakage of quicksilver fumes through the walls of the brick condensers and the permeation of the foundations by the liquid metal are practically overcome by the care taken in constructing these new condensers. The condensers are always underdrained, and inclined iron plates, protected by coal tar, are placed in the foundations. On the other hand, brick condensers can not be regarded as very effective cooling agents. The brick is among the worst conductors of heat, and it is found unsafe to build the walls thinner than nine inches. Besides, the mortar is slowly attacked by the acid fumes, gypsum and other sulphates being formed.

In spite of the numerous disadvantages of brick condensers (says Mr. S. B. Christy in his paper, from which we take these facts), nothing has yet been found to replace them as sedimentation chambers, and when they receive hot fumes still above the dew point, they suffer very little from corrosion.

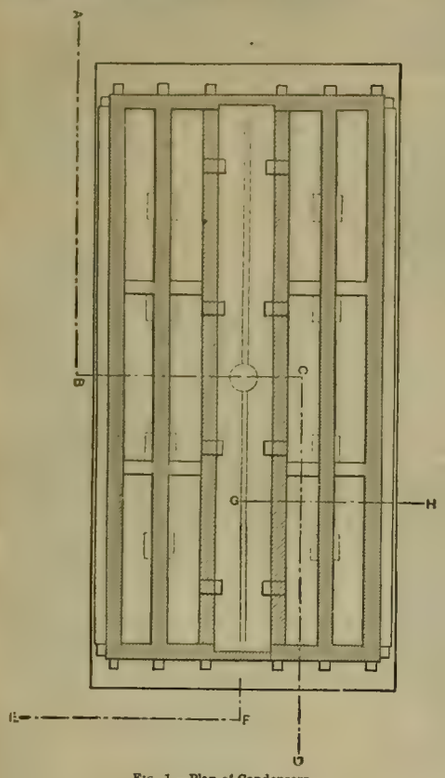

FIG. 1.—Plan of Condensers.

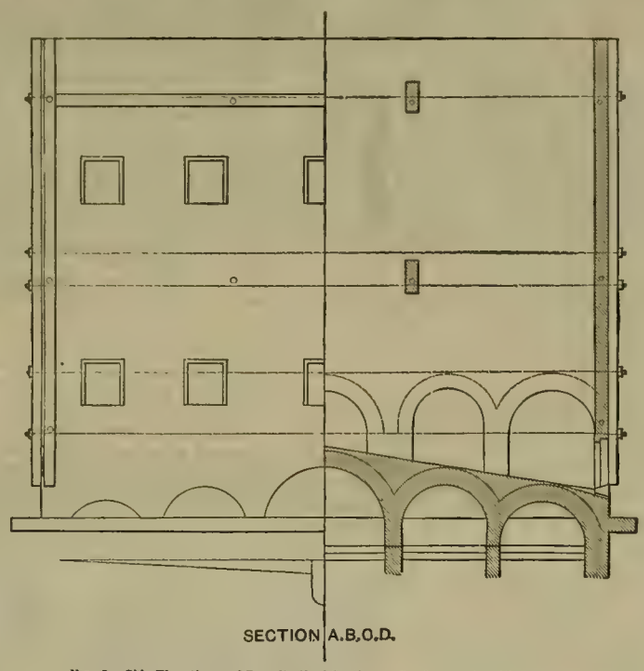

FIG. 2.—Side Elevation and Longitudinal Section Condensers (see Fig. 1).

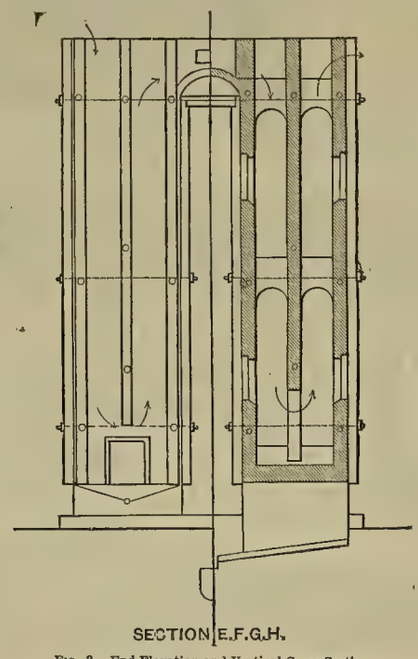

FIG. 3.—End Elevation and Vertical Cross-Section.

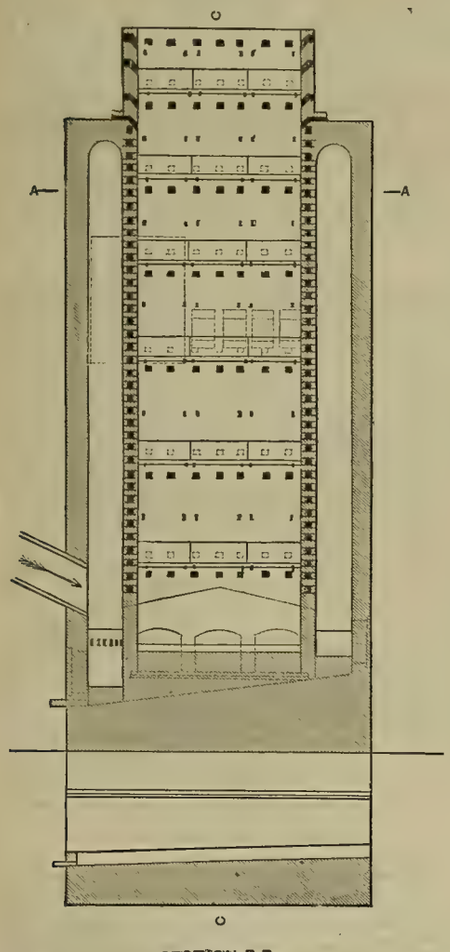

FIG. 5.—Condenser and Drying-Chamber see Figs. 4 and 6).

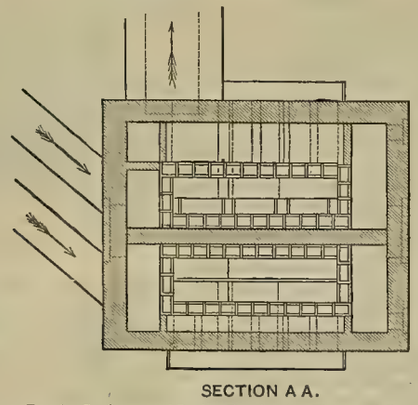

FIG. 4.—Condenser and Drying-Chamber (see Figs. 5 and 6).

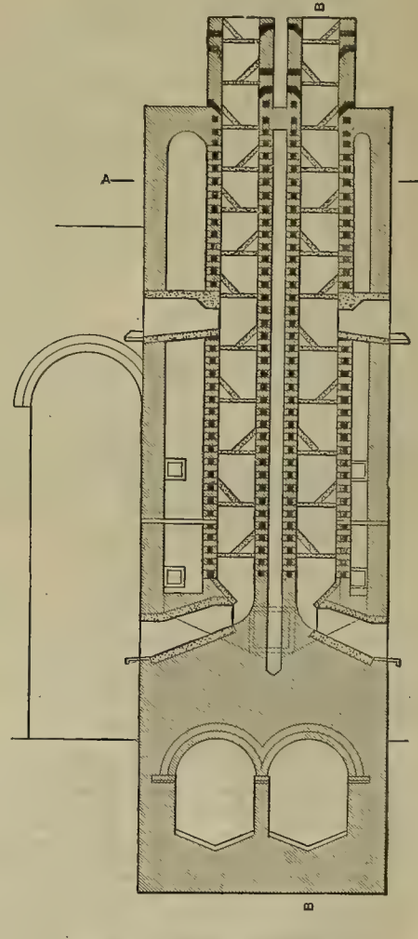

FIG. 6.—Condenser and Drying-Chamber (see Figs. 4 and 5).

QUICKSILVER CONDENSERS AND DRYING-CHAMBERS AT NEW ALMADEN MINES.

OVER 55 coke plants, comprising 9000 ovens, are now idle in Pennsylvania. In the Connellsville coke region the force of strikers has increased to 10,000 men.

JOHN EDWARDS was instantly killed Tuesday afternoon by falling 200 feet in the Washington mine at Ormonde, Nevada county.

Assay of Coal.

Those who are prospecting for coal often have difficulty in determining to what class their finds belong. The principal varieties of coal are as follows:

Anthracite or Hard Coal—Hardness, 2–2.5; specific gravity=1.32–1.70. Contains volatile matter after drying 3 to 6 per cent. Contains carbon 80 to 95 per cent. It has a high luster and burns without flame, as it contains little or no bitumen. It is totally devoid of impressions of plants, and is, geologically speaking, the oldest of all kinds of fossil charcoal, and is regarded as the last stage of carbonization. It yields from 1 to 7 per cent of ash, but 3 per cent may be called the average.

Brown coal, or lignite, much of which is found in California, contains from 57 to 70 per cent of carbon, and represents the first stage of carbonization, being a coal of comparatively recent formation. It is composed of fossil plants more or less mineralized, and when burnt evolves much smoke and affords a dull flame, generally yielding a large quantity of ash. It contains from 2 to 19 per cent ash.

Caking coal is a bituminous coal which softens and becomes pasty in the fire, and after the heat has become continued for a time, the volatile ingredients are driven off and a grayish-black fretted mass is left. The coke obtained from this coal varies from 50 to 85 per cent.

Non-caking coal resembles the above in its external character, but burns freely without softening or showing any appearance of incipient fusion.

Cannel coal is a bituminous coal which generally cakes. It is compact with little or no luster, and has a dull black or grayish-black color. On distillation it affords, after drying, 40 to 66 per cent of volatile matter. When held in the flame of a candle, it easily ignites, burning with a steady, bright flame. It is used extensively for making illuminating gas, of which it affords a better quality than any other species of coal.

It is well to know that no very extensive apparatus is required to determine many points about coal. It can be examined and its commercial properties determined by the blowpipe with great accuracy. Mr. George Attwood (eldest son of Melville Attwood of this city), in his work on "Practical Blowpipe Assaying," gives the following methods of determining the character and properties of coal, by means of the blowpipe:

The assay is divided into five heads:

1st. The moisture determination.

Select from the mass of coal to be examined a few lumps representing as nearly as possible the average quality. Crush them up in the agate mortar into small pieces about the size of a mustard seed.

Weigh out five grains, place in a small porcelain dish, and dry at a gentle heat over the spirit-lamp. Hard coals sometimes fly when heated, so it is best to cover the dish with a watch glass while heating. After about five minutes, remove the assay and weigh; then repeat the heating and again weigh. As soon as the weights agree the assay is ready to be converted into coke. Plattner states that the percentage of moisture is lowest in anthracite; in bituminous coals it is usually three to four per cent, seldom six to seven, and reaches its maximum in lignite and brown coals, which contain 20 per cent and sometimes more.

2d. Determination of the coke production.

Take the dried coal and remove to a clay or platinum crucible, and cover with a small roasting clay dish or platinum cup. Place the crucible on a triangle of platinum wire on the blowpipe stand under the flame, using alcohol, and cover it with a small sheet-iron funnel (the same that is used in roasting copper ores). The heat is continued until all the volatile gas has escaped, when the assay generally will appear to possess a fused porous appearance, and to have a metallic luster.

The coke so made is now removed and weighed. It should be weighed quickly, as coke absorbs moisture from the air rapidly. The coking takes about 10 minutes, and the crucible should not be allowed to get beyond a red heat.

3d. The estimation of the amount of ash.

After the percentage of coke has been determined, remove the assay to a small clay or platinum capsule, and, without using a cover, again heat over the lamp—this time to a bright red color—until all the carbon has been consumed. The operation is much facilitated by occasional stirring the assay with a piece of platinum wire, also by applying the blowpipe flame to the bottom of the cup when the assay is nearly finished.

If alcohol cannot be obtained, the assay for coke and ash can be conducted in the charcoal furnace by using the blowpipe flame, as in the copper assay, and if the ash amounts to more than five per cent, the value of the coal is much diminished. If the ash presents a brown, red, or gray color, sesquioxide of iron has been formed by the oxidation of the pyrites in the coal.

4th. Determination of the absolute heating-power by Berthier's process.

Take an average sample of the coal and crush it up to the finest powder. Weigh out 0 3 grain of the coal dust and mix it with 12 grains of oxychloride of lead, and after placing the mixture in the crucible, cover it with an additional 12 grains of oxychloride of lead.

Oxychloride of lead fuses more readily than litharge; therefore, owing to the large quantity of material which must be brought into a state of fusion in this determination, it is employed instead of litharge.

The assay is next covered with a little powdered glass, also with a few spoonfuls of borax glass. A clay cup is placed over the crucible, and the assay is then fused in the charcoal furnace in a similar manner to the silver assay when litharge is used.

About seven or eight minutes suffices to melt the assay, and the lead button produced by the carbon in the coal acting on the lead oxychloride will be found lying upon the bottom of the crucible when the assay is cool and the crucible is broken.

The weight of the button, when cleaned from the slag, divided by 20, gives the quantity of lead that one part of the fuel under examination can reduce; and since one part of carbon reduces 34 parts of lead, the heating-power of the fuel may be easily ascertained. The amount of lead reduced by one part of coal varies with the different pit coals between 21 and 32 parts, with the lignites between 16 and 25 parts. In making this assay the heat must be applied at first very gradually, and afterward increased to a bright redness.

Dr. Ure's experiments, published in the "Supplement to the Dictionary of Arts, Mines, and Manufactures," have appeared to be unsatisfactory in regard to the accuracy of Berthier's method. Mitchell, however, has found the method correct, and the author has found it equally so. The lead oxychloride should always be pure.

5th. Estimation of sulphur in a sample of coal.

Sulphur generally exists in coal as a sulphide of iron, and as the presence of more than two per cent of sulphur depreciates the market value of coal, owing to its destroying the iron boilers and grates under and over which the coal is consumed, it is always an important part of the examination of coal to ascertain the quantity present.

Mitchell, in his "Manual of Practical Assaying," recommends the following process:

Take one part of the finely pulverized coal and mix with seven to eight parts of niter, and 16 parts of common salt, and four parts of carbonate of potash, all of which must be perfectly pure. The mixture is then placed in a platinum crucible and gently heated at a certain temperature; the whole ignites and burns quietly. The heat is then increased until the mass is fused; the operation is finished when the mass is white. It must, when cold, be dissolved in water, the solution slightly acidulated by means of hydrochloric acid, and chloride of barium added to it as long as a white precipitate forms. This precipitate is sulphate of baryta, which must be collected on a filter, washed, dried, ignited, the filter burnt away, and the remaining sulphate of baryta weighed; every 116 parts of it indicate 16 of sulphur.

The above described methods of examining coal are all that are required for commercial purposes. The assay may be carried on still further by estimating the iron oxide contained in the ash. The ash can also be examined qualitatively for silica, lime, soda and potash.

Postage on Books.

Congress will probably be asked, at the coming session, to include books among domestic mail-matter of the second class—in other words, to make the rate of postage on books, sent in the mails, the same as that now charged on periodicals.

Edward Everett Hale points out, in a recent paper, that no reason now exists for the discrimination against books by the Postoffice Department. He says that periodicals were long ago placed at a rate which is only one-quarter of that exacted for books, in order that the people might be educated in matters of government. The distinction still exists, although the periodical is often heavier and more cumbrous than the book. But a copy of "Scribner's Magazine" will be sent by the United States to an outlying postoffice in Washington Territory at a quarter part of the price which a book of the same weight and the same size will be sent for. The result in the publishing of the country is exactly the same which might be seen if a great shoe dealer were "boycotted" by all the express companies. If the express companies said they would carry Jones & Co.'s shoes for a quarter part of the price for which they would carry Smith & Co.'s shoes, they would say just what the General Government says when it carries the magazine weighing eight ounces for a quarter part of the price of a book weighing eight ounces.

FISH in the Sacramento are being destroyed by thousands by the dumping of sawdust from a new mill recently erected about ten miles this side of Sissons.

Mining Personals.

J. H. Knuthson is secretary of the Young America mine, Sierra county.

P. P. Black is superintendent of the Knownothing mine, Trinity county.

M. L. Elliott is superintendent of the Keystone Con. mine, Amador county.

James McQuarrie is foreman of the Pacific mine, at Pinos Altos, New Mexico.

N. L. Bell, superintendent of the Peck and Occident mines, is in Prescott, A. T.

Philip Oates is superintendent of the San Carlos copper mines on the Gila river.

August Dannenbrink is superintending the Gold Run mine, Knownothing creek, Trinity county.

O. M. Loveridge is superintendent of the Trinity gold mine, on Oregon Gulch mountain, Trinity county.

Supt. Lapham is well pleased with the work done on the Aztec Mill, New Mexico, by Chas. Wilkie, the millwright.

Marcus Daly, the well-known Montana miner, has recently been examining the mines of Red Lodge district, in that Territory.

James Sutherland is superintendent of the Niagara mine, recently sold by W. T. Coleman to an English syndicate for $200,000.

The U. S. Debris Commissioners, while at Smartsville the other day, were "piloted" about by N. C. Miller of French Corral.

Mr. Joseph L. McNally of San Francisco is at present principal assayer for the celebrated Maginnis Mining Co., Maiden, Montana.

Mr. Omsly, one of the owners, is to superintend the Primrose mine, Hog Canyon, Sierra county. The mine will soon be started up.

A. S. Denaugh has charge of constructing the addition to the concentrating-mill of the Emma and Last Chance Co., Milo Gulch, Cœur d'Alene.

L. L. Myers, formerly a hydraulic mining man of this State, is in charge of gravel mines near Poto, Peru. The mines are at an elevation of 11,450 feet.

James B. Haggin sailed from New York for Europe last Saturday. He won the suit against the French Copper Trust for $200,000, and has gone to collect the money.

Mr. W. A. Clark made a very telling and important speech on the subject of "Taxation of Mines" in the Constitutional Convention of Montana. It seems strange that in that section it is necessary for some one to defend the mining interest.

A. D. Weske, the well-known mining man who has been operating for some time on the Forest Hill divide, Placer county, has bonded the George Squires drift mine, located near Alta, for one year, and will put on a sufficient force to thoroughly prospect it.

Few deputy U. S. mineral surveyors are better known in this State than Chas. Hendel, whose "stamping ground" is in Sierra and Plumas counties. And there are few of them who have tramped more miles of mountain country than he. The *Mt. Messenger* says, however, that "having amassed wealth, he now travels in a buggy."

The work of overhauling and repairing the pump and shaft of the Pioche Cons. M. Co., at Pioche, Nev., has been carried on under the direction of E. A. Shear, who has had large experience in such matters, and who came from Park City, Utah, for the purpose. A paragraph in our "Mining Summary," on another page of the PRESS, describes the work done.

Philip Deidesheimer is general manager, and L. Foss superintendent of the Young America mine, Sierra county, which has recently been bonded by Geo. M. Pinney and others. The mine is on the mountain-side, above Upper Sardine lake, and back of the great Sierra Butte. The mill is on the bank of Lower Sardine lake, and is run by a Pelton wheel, with water from the upper lake. The same water is again used by the Yuba mill of the Sierra Buttes mine, which is down on the river bank.

The Inyo *Independent* says that it is due to two men that the Cerro Gordo mines in that county have been sold. Thos. C. Boland and J. S. Gorman ventured their money in the mines when nobody else would do it, and it is owing to their courage and energy that the mines were got into such condition that capitalists were willing to buy them. The change of ownership will result in a revival of mining industry all over the county; but for this revival Boland and Gorman are the first to deserve thanks.

"Darling Delinquent."

A country editor discourses, under the above heading, in a manner which almost every editor and publisher can appreciate, as follows:

Dear, darling delinquent! Our precious subscriber in arrears, do you think we have sold out and gone west to mingle with the grasshoppers? No, no, little sugar plum, we could not get away if we wanted to. We are still at the old stand dishing out the *Democrat*, sweet promises and bright expectations. They make an excellent diet, darling, with a little encouragement, to serve as dessert. We are waiting for thee, turtle dove. We long to hear the sound of thy footsteps on the stairs and the silvery ring of thy voice within our lonely sanctum. Dear one, we feel unusually sad and lonely without thee to-day. We sigh for one glance of your eye and even half you owe us. Don't see how we can possibly live happy without you, dear. Now, little pie crust, will you come? Do we hear your answer in a voice so sweet and beguiling, "I am coming," or is it only the wailing winds that round our sanctum roar? We pause for further developments.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & CO.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JULY 30, 1889.

407,947.—SAFETY CATCH FOR CARS OF INCLINED RAILWAYS—W. C. D. Body, Grass Valley, Cal.

407,922.—PIPE COUPLING—W. M. Brown, Jr., Sacramento, Cal.

407,771.—TOOL FOR CUTTING OUT BOILER TUBES—John Comer, Redding, Cal.

407,964.—PAPER BOX—H. Roensch, S. F.

407,965.—FRUIT PITTER—Jno. Rosassco, Healdsburg, Cal.

408,149.—HYDRAULIC ELEVATOR—W. F. Toothaker, S. F.

The following brief list by telegraph, for Aug. 8th, will appear more complete on receipt of mail advices.

Arizona—August H. Elfers, Phœnix, water elevator; James Pringle, assignor of half an interest to R. Bowen, Silver King, hose coupling.

Oregon—Charles Hay, Portland, supply and water cock; Horatio F. Hicks, Ashland, oar; Lafayette W. Longhary, Monmouth, gate.

California—Henry C. Beatty, Sacramento, steam motor for pump; Charles H. Ensign, Temescal, and H. B. Wright, Berkeley, packing for stuffing-boxes; Edwin H. Fowler, National City, removing vermin or the scale from plants; William W. Hanscon, deceased, San Francisco, hose coupling; Reuben W. Hent, San Francisco, roller bearing; Benjamin Holt, Stockton, header and thrasher; Benjamin Holt and J. Draper, Stockton, traveling thrasher; John and H. Jessen, Santa Ana, mold for artificial stone fences; Peter H. Croncke, Santa Rosa, counter shelf and belt tightener; William R Lindbey, Arcata, cartridge shell; John Main, French Gulch, vehicle brake; Daniel S. Regan, San Francisco, gas engine; John Ringen, Coronado, device for utilizing tide-power William W. Slater, Oakland, automatic bell ringer; Adolphus Emmer, Berkeley, water-proof preparation; James S. Williams, Oakland, zinc electrode for galvanic batteries; John C. H. Stutt, San Francisco, cable railway for turn-tables.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAFETY CATCH FOR CARS OF INCLINED RAILWAYS.—Wm. C. D. Body, Grass Valley. No. 407,947. Dated July 30, 1889. This invention relates to that class of safety devices for use on the cars of incline railways in which a gravity hook is carried by the car and is held normally inactive, but which upon the breaking of the hoisting cable drops down to an engagement with the ties of the track or a fixed rack below. The invention consists in the novel construction and arrangement of the safety hook and its connections.

HOOP CLAMP.—Asa R. Wells, S. F. No. 407,559. Dated July 23, 1889. This invention relates generally to the class of devices adapted to be applied to the ends of hoops for tanks and other similar vessels, or cylindrical or circular bodies, for the purpose of drawing said ends together and tightening the hoop, and it relates particularly to that sub-class of these devices in which a left and right hand threaded bolt is seated in opposing heads attached to the hoop ends, and by its rotation draws the said heads together. The object of the invention is to provide a hoop clamp which is adapted to conform itself to the curvature of the hoop, so that the strain which it exerts shall be in the line of said curvature instead of tangential thereto.

FRUIT-PITTING MACHINE.—John Rosassco, Healdsburg, assignor of one-half to Joseph Cuneo, S. F. No. 407,965. Dated July 30, 1889. The invention relates to that class of machines in which the fruit rests upon a properly apertured and slitted bed, and a vertically movable spring-controlled punch provided with side-knives or cutters is brought down upon the fruit, whereby its flesh is cut and its stone or pit is driven out through the bed. The arrangement of spring devised by this inventor is simple and effective, and is less liable to get out of order than the spiral spring encircling the rod, as has heretofore been customary. The lever connection having the variable fulcrum is of advantage in providing a simple power device for imparting a perfectly vertical or perpendicular motion to the bent rod.

NEW WATER METER.—At the last meeting of the California Academy of Sciences Mr. Fr. Gutzkow gave an interesting description of an improved water meter, which will register accurately even drops of water passing through. There are two kinds of meters in use, one of which works with a small turbine-wheel, the revolutions of which are recorded, and the other works with a piston. Both are inaccurate, and while they sometimes register wrong for the company, they more than make it up against the consumer. Then they do not register when the water flows at a less rate than half a gallon per hour, and the Chinamen know this, and by letting a small stream run get their water for nothing and swindle the company. By the perfected meter this cannot be done, but it is so arranged as to protect both the water company and the consumer.

The Mining Companies' Financial Standing.

Displacing a Stamp-Mill.

The Dodge ore pulverizers, manufactured by the Parke & Lacy Co., in this city, have been doing some remarkable work of late at various mines. It is only within the past year or two that the perfected machines have been put on the market, but since they have the results have proved them very satisfactory. It will interest many to know that in some instances rotary pulverizers have displaced stamps. The following letters are self-explanatory:

GRANITE, GRANT CO., OREGON, March 6, 1889.

Messrs. Parke & Lacy, San Francisco, Cal.—GENTLEMEN: Your letter came to hand asking me about the machinery. In justice to yourselves and Mr. Dodge, I have been intending to write to you for some time. The Dodge pulverizer, so far I can truly say, is a most excellent worker. The wear has been light and it does good work in every way. As far as wet crushing is concerned, if it holds out as it is doing (and I do not doubt it), it is in my opinion far ahead of stamps. No trouble whatever, and the stoppages amount to nothing.

Yours truly,

(Signed) J. B. CABELL.

The above mill was started in October last.

TEXAS MINE, REDDING, CAL., July 20, 1889.

N. P. Sheldon, Esq.—DEAR SIR: Your letter came to hand during my absence. I hasten to reply. Ours is a No. 2 machine, three feet in diameter. Our ore is very hard quartz. It is crushing now 12 tons of sulphuretted ore a day—all we can handle on two Frue machines. We could crush more, but the Frue machines won't handle the pulp. We have run nearly six months, and our expenses on machine have been $84 to date, and will run another month before we shall want bars. We amalgamate on plates 4 feet wide and 12 feet long, and save all free gold in the ore. We took out a stamp-mill to put in the pulverizer. We saved 60 per cent with the stamps Now 90 to 93 per cent by fire assay is saved. Stamps slime our ore. The pulverizer granulates it. We are well pleased with it, and it would pay you well to come and see it work if you contemplate purchasing.

Respectfully yours,

(Signed) HART & FLEMING, per R. G. HART.

LITTLE NELLIE MINE, SHASTA, CAL., July 29, 1889.

T. E. Dunbar, Esq.—DEAR SIR: I am not prepared to give you all the particulars that you desire, but am free to say that the Dodge pulverizer is my favorite. With No. 20 screen it will pulverize 13 to 16 tons per day, and do the work nicely. From what I have seen, I would not change for any other kind of a mill—not even if the other were to be furnished me free of charge and my money paid for the Dodge to be refunded in full.

Very truly yours,

B. N. BUGBEY.

The above mills are all the small-size pulverizers. The large size has double the capacity.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address H. L. DENIO, Upper Lake.

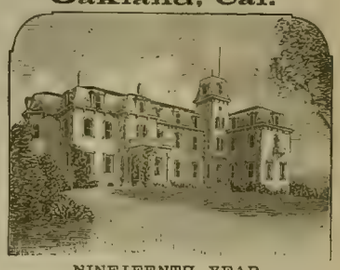
FOR SALE.
One 10x13 inch Clayton Belt Air Compressor.
One 3-inch Sergeant Drill.
One 5-ft. Double Screw Drifting Column with Arms.
One 4-ft. Single Screw Stoping Bar.
One 8½x13 ft. Air Receiver.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.
The above are in first-class condition and will be sold cheap. For price apply to the
PAYMASTER MINING CO.,
Yuma, Arizona Territory.

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.
Ships under advances to smelting works in Boston, New York, Baltimore and Liverpool.
Twenty-one years' experience in Shipping Ores and Managing Mines.
Solicits Consignments of Copper Produce and Management of Mining Matters.
All business conducted on Cash Basis.
Purchase and shipment of Mining Supplies A SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.



THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 22 ft; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

PERFECTED

DOUBLE

Economic

Quartz

Mill.

Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

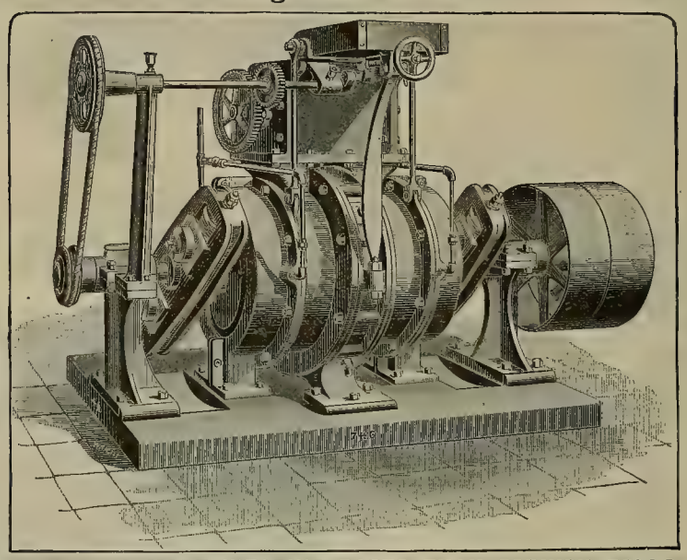
It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

TATUM & BOWEN,



34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,

AND PORTLAND, OREGON.

MANUFACTURERS OF MINING AND SAW MILL MACHINERY.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

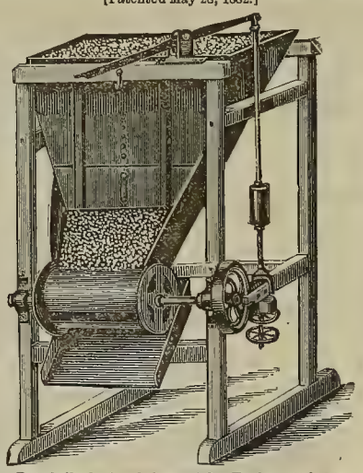
OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts. 145 Broadway, New York.

FOR SALE CHEAP.



One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron hangers for top saw. Friction feed-works, patent steel screw double-throw head-blocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,

San Francisco, Cal.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

—THE—

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.

W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

D. C. WICKHAM, Taylor Mine, Greenwood, Cal.

J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

The Cotton Trade of the World.

The world's cotton supply is constantly growing more and more interesting. Notwithstanding the rapidly increasing supply all over the world, great anxiety is always felt at the indications of a short crop anywhere, and especially in the United States. The recent crop reports of the Department of Agriculture indicate a slight increase in this year's crop, while arrivals at European ports from India and Egypt promise to be in excess of the receipts of last year. Still the world's supply is not fully up to the demands of the manufacturers, either in this country or Europe. There are at this present writing strong grounds for higher prices the coming fall. Stocks in Great Britain are thought to be in a fair position to meet ordinary demands; but continental stocks are low. If cotton would remain at present prices for American middlings, the production of the world would have to be largely increased to meet the growing demand.

Russia's Efforts in Transcaucasia.

In view of this state of facts, much interest is manifested in the efforts to extend the culture of cotton in the Eastern hemisphere. The Russians are taking an active interest just now in introducing not only its culture, but its manufacture as well, in Transcaucasia. The cotton area of this region has been very considerably extended the present season, with every probability that further additions will be made from year to year. Many Moscow firms are engaged in the cultivation of cotton in the government of Erivan, and last spring gave unusual attention to the planting of superior seeds and improved cultivation. It is reported that the planters there expect to gather from 36 pounds of seed a crop of 900 pounds of seed cotton, which will yield 360 pounds of lint. This implies high cultivation and heavy growth of staple. The American cotton gin is in use in parts of Transcaucasia. One Moscow firm has six in operation, made in Massachusetts. Some English gins are also in operation. They are spoken of as giving satisfaction. The natives are ginning their cotton and delivering to first hands, avoiding as much as possible the middlemen. The American seed is being freely distributed among the natives, and marked improvement is already noted in the yield.

The Bombay Cotton Movement.

The Bombay cotton reports for May indicate that there is a growing demand for exports, notwithstanding the demand for home consumption. The freight demand had so stiffened prices that the local mills were holding, and purchases on their behalf had not exceeded 10,000 bales. The report says: It is certain that there will shortly be a good demand from this quarter, as the stocks at the mills are low, and the monsoon requirements must shortly be filled. Attracted, no doubt, by the high prices now ruling, receipts have been on a large scale, and at present show no signs of falling off.

It is quite possible that even the highest estimates of the exports to Europe for the current six months may be exceeded, which, however, will be at the expense of the latter half-year's shipments. At the date of the report the shipments were very large and more than kept pace with the rate of receipts. Nearly 1,050,000 bales had already been exported, and the total for the current six months was expected to exceed 1,100,000 bales, which was considerably above the largest estimate.

The Egyptian Cotton Crop.

The condition of the growing Egyptian cotton crop is reported to be favorable. The following is from the Cotton Association at Alexandria, dated May 31st: The temperature in general, during May, has been favorable for the growing crop; the plants are fully developed and look well. The distribution of water continues satisfactory; cotton lands are easily irrigated and in some places even by gravitation. This condition is due to the Barrage and to the system of rotation established throughout the country. By these means the water is maintained at a relatively high level. The deficiency of water at Cairo this year is insignificant as compared with the previous three years, in spite of the large deficiency at Assouan. The area sown with cotton is equal to that of 1888. All information tends to show that the condition of the growing crop is very satisfactory. The well-grown plants have the advantage of being better able to resist adverse circumstances; but it is impossible, as yet, to appreciate what circumstances, either for good or evil, may arise.

Egyptian Cotton in Ancient Times.

In Egypt, cotton has been cultivated for many centuries past. Pliny (in the year 79) mentions it as existing in Upper Egypt. Egyptians esteemed cotton fabrics very highly, as shown by the Biblical records of the period of the Hebrew sojourn in Egypt. Joseph received as a gift a robe of cotton from the Pharaoh then reigning.

Arabs were the first to introduce cotton cultivation into Southern Europe, and to establish cotton fabrics in Spain. Abu Abdallah sent presents of cotton goods made in Spain to the Emperor Charles the Great; and under Abd-er-Rhaman, during the 10th century, the cotton industry was in a very flourishing condition.

At the time of the discovery of America, its inhabitants were familiar with cotton. It was among the presents given to Columbus by the Guanahani, and the people of Hispaniola had to furnish him with 25 pounds of cotton every three months. Large stores of cotton and cotton fabrics were found in Cuba at that time.

Excavator for Auriferous Gravel.

The accompanying cuts are views of the excavator buckets used in the mechanical movement of auriferous gravel from the Lambing or Arroyo Seco gravel mine, Amador county. By means of derricks, fitted with these buckets, excavations as deep as 60 feet have been made. The derricks can put the material up to a hight of 45 feet. The buckets are swung on a boom which describes a semi-circle in the air of 220 feet. The bucket rises from the ground, the arm of the derrick swings toward the point designated, dumps its load, and returns to refill itself, and consuming from three-quarters of a minute to two minutes on the trip, according to the hight it is raised and the distance swung. The depth of overlying gravel and loam in this claim is about 26 feet, and the pay gravel below is 4 feet.

Two derricks are employed; the weight of each, including accompanying machinery, is from 75 to 80 tons. The length of the boom, the outer end of which is elevated 58 feet, is 114 feet; it is capable of carrying a load of 7 tons, but usually lifts about 2 cubic yards of gravel. The boom is made of Oregon pine, 12 inches by 18 inches at the foot, 12 inches by 24 inches in the middle, and 12 inches by 12 inches at the outer end, where a four-foot sheave is located, which carries the hoisting cable, a flexible steel-wire rope, one inch in diameter. The machine is handled by an operator, called a lever-tender, who stands about 50 feet above the foot of the mast, in a little house, near the top of the mast, where levers are attached by gas pipe to the machinery below. All is under the management of this man, who, owing to his elevated position, has full view of the surroundings and perfect control of the entire operation.

The steam cylinder is located on top of the bucket; the steam passes through inch gas pipe of various lengths, connected with globe and socket joints for flexibility. The pipe connects the cylinder with the steam drum of the boiler of the derrick. As soon as the bucket on descending has reached the gravel, steam is turned into the cylinder by means of a five-way valve, below the piston head. This causes the piston rod to rise and draw together the clasping parts of the bucket which enfold the load; by turning the valve still further, the steam enters above the piston head, forces the rod down, and empties the bucket; turned still further, the steam escapes. Each derrick has two boilers and two engines provided with link motion.

This peculiar bucket or lift was patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by J. P. Lambing and S. N. Knight. A machine of this character is now being built at Golden, Col., under the superintendence of Mr. Lambing. It is useful wherever there is "low" ground with no facilities for dump.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

SILVER WAVE G. & S. M. CO., Aug. 5. Location, Virginia, Nevada. Capital stock, $10,000,000. Directors—T. D. McKenna, H. H. McAllister, T. K. Wilson, C. W. Kellogg and W. H. Nelson.

MOUNTAIN WOOD AND LUMBER CO., Aug. 5. Capital stock, $50,000. Directors—S. D. Smith, A. Rixon, J. Martin, A. J. Mitchell and D. M. Dysart.

PACIFIC TILE AND BRICK CO., Aug. 6. Capital stock, $100,000. Directors—J. T. Davis, M. H. Turrill, M. C. Jewell, C. B. Turrill and J. F. Davis.

DEERE IMPLEMENT CO., Aug. 6. Object, to manufacture and deal in agricultural implements and machinery. Directors—Chas. H. Deere and Stephen H. Velie of Moline, Ill.; Marcus C. Hawley of Newton, Conn.; Geo. T. Hawley and Fred W. Vaughan of Oakland, Cal.; Walter N. Hawley of Santa Barbara, and Edward A. Wheeler of San Francisco. Capital stock, $200,000.

RUSSIAN COTTON FACTORIES IN ASIA.—According to Mr. Charles Marvin, a company is erecting a large cotton-mill at Samarcand and another is to be built at Merv. Baron Alphonse Rothschild is arranging to invest a large sum in the cotton-pressing business in Bokhara, and a Russo-American syndicate is preparing to compete with him for business. Yet it is only a few years since Vamberg went through that country disguised and in fear of his life from the Tekke and Yonmat Turcomans. Now all that is changed. The Russians first conquered the wild tribes and then gave them work at railroad building; the next move was to open a system of irrigation and import cotton seed, several tons of upland cotton seed having been imported from this country. The mills follow the cotton as a matter of course in a protectionist country.

ERRATUM.—In the article on Tuolumne mines in last week's PRESS, page 83, is the following sentence: "The ditch made sufficiently large to carry the required volume of water necessary for the *wood* can be constructed at a cost not to exceed $7000." The word "wheel" should be substituted for "wood."

Connecting the Apron and Battery.

(*Continued from page 101.*)

stead of being flat, the rounded form being better adapted for saving the gold. The aprons here in use are five feet by four feet, with an inclination of 1½ inches to the foot; at their lower end is a drop of about a foot to the sluices; the pulp, however, does not drop, but flows downward on a curved plate, which catches a good share of amalgam.

Callustro

Is the name which has been given to a substance recently discovered on a farm near Calistoga, Napa Co., Cal., the property belonging to Mrs. Emma P. Eells of Oakland. Scientists and mining experts who have examined callustro agree in pronouncing it a most useful and valuable discovery, particularly for the wonderful cleansing and polishing properties which it has been found to possess.

Professor H. G. Hanks, formerly State mineralogist, gives his analysis, showing it to contain silica, alumina, magnesia and many other ingredients.

He further says: "It is entirely new to him, nothing like it ever having come to his hand before, and that in its finest powdered form, under the microscope the motes still show the keenest and sharpest cutting edges, rendering it extremely valuable as a polishing agent. The extended and critical tests to which it has been subjected has more than borne out this prediction. In powdered form, though a gray, flour-like substance, free from grit, delicate and soft to the touch and exceedingly agreeable to the skin, it polishes each of the common and precious metals in use as well as glass and all precious stones with marvelous quickness and a luster that is wonderful, and possessing the invaluable property of remaining a much greater length of time than the luster of any other known polish."

Mrs. Eells has displayed remarkable fertility and business qualifications in finding out the many valuable uses to which her mineral could be applied, viz., introducing it into several qualities of soap very effective for removing grease and stains of all kinds from cloths and the hands; also as a tooth powder, nail enamel, needle-polisher, metal polish unequaled, and not by any means least, as a remarkably fine natural paint and kalsomine.

For the purpose of placing callustro upon a commercial basis, a corporation has been formed with a capital stock of $100,000, and composed entirely of well-known ladies of Oakland, with Mrs. Emma P. Eells as president, with the following board of directors: Mrs. Susan L. Mills, Mrs. Sarah Haight Tompkins, Mrs. M. Belle Holmes, Mrs. Clara F. Hamilton, Mrs. Rebecca Knox, Mrs. Phœbe Watkins. The company are busily engaged in preparing and placing their goods, in various forms, upon the market, and judging from actual use and the numerous reliable testimonials at hand, as well as the already great demand for callustro, it is safe to pronounce the enterprise an assured success.

Fire-Proof Paint.

Messrs. C. A. Scoville & Co. 471 Ninth street, Oakland, have recently taken the Pacific Coast agency for the New York Fire-Proof Paint Co. These paints have been introduced in the Eastern and Southern States with marked success, and are being used in great quantities. They are prepared of the best materials, and in durability, spreading, covering and finishing qualities, compare favorably with any first-class paint. All colors are put up in pails and barrels, mixed and ready for the brush, requiring only to be stirred before and while in use. The Vulcan brand is adapted to the finest work on hard surfaces, the Soteria being intended for use on rough interior surfaces, such as floor beams, lath, etc. The fire-proof qualities of the paints have been subjected to most severe and critical tests in various cities, substantiating in every instance the strong claims made by the manufacturers. Many testimonials are at hand from prominent architects and insurance men throughout the country, a couple of which are herewith given:

Fire Underwriters' Association.

NEW ORLEANS, March 16, 1888.

Messrs. Giffney & Co., Agents New York Fire-Proof Paint Co., 23 Union street, New Orleans: DEAR SIRS:—I take pleasure in transmitting to you the following action in regard to your Vulcan paint and Soteria.

Resolved, That this association, after the severe test witnessed by the Fire Committee and numerous other members of the association, being convinced of the fire-resisting qualities of the Vulcan paint and Soteria, manufactured by the New York Fire-Proof Paint Company, has no hesitancy in recommending it as a protection against fire. Respectfully,

GEO. MATHER, Secretary.

Coronado Fruit-Package Co.

John McArthur, Esq., Oakland, Cal.:—DEAR SIR: In reply to yours to the Portable House Company, I have to say we have used the New York Fire-Proof paint on and in our factory, and consider it better than insurance. We feel very safe from accident by fire, and, in consequence, shall not insure. Yours truly, E. DENSMORE.

The especial attention of architects and builders on the Pacific Coast is called to C. A. Scoville & Co.'s advertisement in another column.

THE Southern Pacific Co. has in contemplation 320 miles of extension in their California roads during the next year. Orders have already been placed with Eastern manufacturers for 30,000 tons of steel rails, and it is expected that double that quantity will be required to complete the contemplated extensions.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

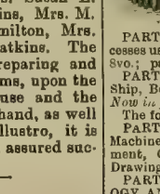
WM. WILKINSON—San Joaquin Co.
WM. H. COOK—Santa Cruz Co.
JULES BAUMANN—Arizona.
CHAS. F. BLACKBURN—Idaho.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (8, ½) from week to week and year to year.



Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

"Your 'Handy Lists' will help us out wonderfully."—*R. B. Trouslot & Co., Kansas City.*

"It is an excellent idea."—*W. H. Boardman, Railroad Gazette, New York.*

"I find your lists very useful, the title subjects of works being much full er than in other catalogues, and the numbering system is very handy for reference."—*Robt. D. Richardson, Bookseller, Winnipeg, Can.*

Handy Lists of
Technical Literature.

Reference Catalogue of Books printed in English from 1880 to 1888 inclusive; to which is added a select list of Books printed before 1880 and still kept on publishers' or jobbers' lists.

COMPILED BY
Henry E. Haferkorn
and Paul Heise.

PART I—Useful Arts in General, Products and Processes used in Manufacture, Technology and Trades; 99 p.; 8vo.; paper, $1.25; cloth, $1.50.

PART II—Military and Naval Science, Navigation, Ship, Boat and Yacht Building, Rowing, Sailing, etc. *Now in preparation.* Paper, $1.25; cloth, $1.50.

The following parts are in preparation and will contain:

PART III—Steam and Marine Engineering, Mechanics, Machinery, Railroad Building, Construction and Management, Civil Engineering, Surveying and Mechanical Drawing.

PART IV—MINES, MINING, ASSAYING MINEROLOGY AND GEOLOGY.

PART V—Fine Arts in General.

PART VI—Architecture. Carpentry, Etc.

PART VII—Reference Works, Etc.

Each part of the Catalogues is arranged in alphabetical order, according to authors, with a subject index in the same alphabetical arrangement, containing also *analytical references to parts or volumes of important works, like Cyclopædias, Reference Works, etc.* EACH PART IS SOLD SEPARATELY.

A Key, containing the names and addresses of the publishers and jobbers of each book, will be furnished ONLY TO BOOKSELLERS and Librarians at 25c extra.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore ithout quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 166 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & CO., S. F.

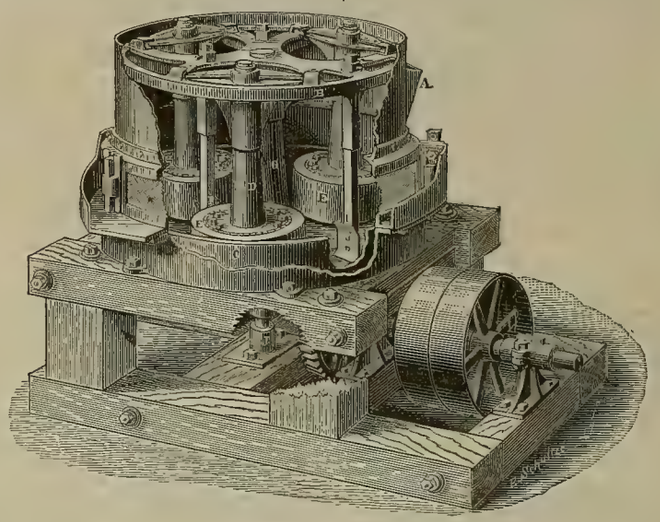
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

The Celebrated H. H. H Liniment.

The **H. H. H. Liniment** is for the treatment of the Aches and Pains of Humanity, as well as for the ailments of the beasts of the fields. Testimonials from importers and breeders of blooded stock prove its wonderful curative properties. No man has ever used it for an ache or pain and been dissatisfied.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 7, 1889.

General trade the past week was only fair. So far the summer trade has been disappointing. The large proportion of interior merchants appear to confine themselves to assortment buying, deferring stock purchases as late in the season as possible. Harvest-field work is about over, and now farmers are chiefly engaged in delivering their grain. It is generally reported that about all is going into the warehouses, owing to the prices not being high enough to induce selling. Foundrymen do not report an active business. Although there is a large increase in the number of buildings going up, yet very little iron is being used in their structure. This is due to a change in style of architecture, which requires in large business buildings stone work instead of iron.

In the local market money is reported to be easy, with all legitimate wants readily met by the banks at current rates of interest. It is claimed that less money is now tied up than at this time in 1888. In this month last year there were large quantities of wheat and wool warehoused, while now there is comparatively little. Other articles of trade, it is said, show a similar change. Mr. Rideout, a leading banker in the Sacramento valley, states that a larger proportion of the wants of farmers on warehouse receipts for grain will be met in the interior than ever before. Advices from other parts of the State are of the same tenor. While this will probably be the case, yet owing to the large crop, more money will be required than for several years past, unless prices for wheat advance so as to induce selling. Remittances from the interior are light, but not more so than usually obtains at this season of the year. Free remittances are looked for toward the close of this month.

The call for money for speculative purposes has been light. The chief inquiry comes from dealers in grain futures, as both mining stock and local securities are now not very attractive to outside operators.

The steamer Belgic, hence August 3d for China, took out the following treasure: To Hong Kong, Mexican dollars, $108,140; gold coin, $7756; silver bullion, $91,000; gold-dust, $960. To Shanghai, Mexican dollars, $66,000. To Japan, Mexican dollars, $51,000; silver bullion, $297,000.

The amount of treasure in the Sub-Treasury in this city was as follows on July 31:

United States notes	$54,933 00
National Bank notes	10,380 00
Gold coin	38,763,624 00
Standard silver dollars	18,133,807 00
Fractional silver	6,684,551 60
Gold certificates	3,280 00
Silver certificates	60,225 00
Minor coin	6,793 50
Total	$63,707,694 00

The shipments of silver from the Sub-Treasury into the interior of the State and elsewhere for the month were as follows:

Standard dollars	$264,260
Fractional silver	68,000
Total	$332,260

MEXICAN DOLLARS—The market has held fairly steady at from 74@74½c. The demand is only fair. With the Chinese returning to the city for wintering, more business is looked for. Dealers in Mexican dollars state that the number of Chinamen on this coast is steadily decreasing.

SILVER—The market eased off some the past week in sympathy with lower prices abroad. Sales were made at 92⅛c an ounce. The decline in our market is also due to sterling exchange being heavy, with the tendency to lower figures. London cables quote silver bullion to-day at 42 3-16d. New York is quoted at 92@92⅛c, and our market closes at 92¼@92½c. The latter price only obtainable under exceptional circumstances.

QUICKSILVER—Receipts at this port in last month and for the first seven months of the year compare as follows:

	For July.	Jan. 1 to July 31.
1887 flasks	1,759	13 342
1888	1,355	15,930
1889	1,278	9,483

Receipts at this port the past week aggregated 281 flasks. The market is reported quite strong in sympathy with foreign advices. The consumptive demand is only fair.

BORAX — Receipts the past week aggregated 2304 ctls. This is the heaviest weekly receipt in this year. The market is steady. There was shipped the past week 22,929 lbs. to Chicago, via C. P. R. R.

LIME—Receipts the past week aggregated 5302 barrels. The demand continues free at unchanged prices. Honolulu drew 300 barrels the past week.

TIN—The market is quiet but steady. Sales are making at quotations for spot parcels. The advance in outward freights from England is at present against forward shipments. Imports the past week were 10 boxes plate overland, and 2312 ingots from Australia. There was shipped to Victoria, B. C., 54,000 lbs. plate and 3821 lbs. pig.

LEAD—The exports by sea the past week aggregated 3552 lbs. to Victoria, B. C. The market has ruled fairly steady at firmer prices. Eastern advices report more of a speculative movement, which, with the consumptive demand, caused a strong market there.

COPPER—The market shows more strength. This, no doubt, is due to advices that negotiations between the Tharsis Company officials and the liquidator of the old Comptoir d'Escompte are likely to result satisfactorily. Some of the American companies are shutting down owing to the low prices not covering the cost of production. A meeting of the Lake companies is to be held soon so as to determine on the future course in both production and marketing the metal. The past week a shipment by sail of 12,595 lbs. of copper matte was made direct to Liverpool, England.

COAL—Imports the past week were as follows: From Comox, 4300 tons; Seattle, 2550; Tacoma, 8500; Port Townsend, 750; Departure Bay, 2127; overland, 40; Coos Bay, 700; total, 18,967 tons. In the local market the tone does not appear to be quite so confident, owing to the free output of the coast collieries and more ships heading this way from Australia. A local exchange says that Australian dates of July 1st quote coal freights as follows: Newcastle for San Francisco, 13s; to San Diego and Wilmington, 15s. Best screened coal at Newcastle was quoted at 11s. This makes coal and freight to San Francisco 24s., or $6 per ton. The duty on arrival is 75c per ton. The cost of freight coal from the Puget Sound and British Columbia mines to this port is $2.25 and $2.50 respectively. A new deposit of coal has been discovered in British Columbia, which will be known as the North Wellington. Samples show it to be a strong coal.

IRON—In the local market last week's report covers this week's advices from dealers and consumers. English advices continue to report an irregular but strong market. Eastern advices report a strong market.

The following are the latest comparative quotations f. o. b. at Glasgow:

	Aug. 1, '89.	July 26, '89.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Aug. 7, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42⅜	92¾	$11 90	$3 97½	$19 75
Friday	42⅜	92½	11 75	3 97½	19 85
Saturday	42 5-16	92½	11 75	3 97½	19 85
Monday		92½	11 70	3 90	19 80
Tuesday	42¼	92⅝	11 85	3 87½	19 85
Wednesday	42¼	92⅝	11 85	3 87½	19 85

NEW YORK, Aug. 7.—The iron markets are as firm as ever. Consumers are looking for early instead of delayed deliveries of contracts. Steel is very firm, $28 being asked for rails, with two months' business in the hands of the mill-owners. Stock speculation displays a strong undertone on the crop and traffic outlook, but there is neither interest nor activity in trading. Lake Ingot copper still quoted at 12c. Export bid about 11c. Electric and good casting grades at 10¾@10¾c. Common, 10@10¼c. The Boston *Transcript* estimates the output of Lake Superior mines at 42,000,000 lbs up to date, against 38,000,000 lbs for the corresponding period of last year. Pig lead is doing better, $3.95@4. August and September delivery 1000 tons. Borax fair; business full at recent figures. Quicksilver higher. Sales at 70@72c. Late Rothschild cable quoting at £9 15s.

D. KABEEL of Santa Cruz has petitioned the Superior Court for a writ of mandate to compel the principal of the public school to receive his son, who was excluded because he was not vaccinated. This will test the constitutionality of the law passed by the recent Legislature, making vaccination compulsory for schoolchildren.

Mining Share Market.

Trading in mining stocks the past week was quite active, with declining prices up to Tuesday, when a steadier tone set in, with a slight advance in the Comstocks at the afternoon session. This advance was maintained yesterday. The feeling was panicky for the week ending with last Tuesday, but well-distributed buying orders by the pool or their representative brokers prevented a general and disastrous break, yet values shaded off enough to clean up nearly every share of stock that was on a margin. Brokers called for money twice during the week to make margins good, and customers not responding were sold out without the least compunction of conscience. Those who were able either responded or else sold enough stock to take up their accounts. We dare say that there are fewer stocks on margin than ever before known, with prices as low as they are. The assessments falling due in this week, with more due soon and more assessments to be levied, are not the best of soothing syrups for a weak market, particularly when one broker firm suspends, a clerk in another goes off with considerable money, and last, but not least, sedulously circulated reports of other failures pending. Take it all in all, the past week witnessed more demoralized outside dealers than since the heavy break after the 1886 deal. The firm action of the north-end stocks, with Con. Virginia the leader, was the redeeming feature of the market. In outside stocks there was more trading, but at lower prices. Following the Comstocks the Tuscaroras fell off about 25 per cent, the Quijotoas 30 per cent, and Bodie 40 per cent. This latter stock, at break-neck speed, tumbled from $1.05 to 65 cents. The latter is the lowest price at which it has sold for several years past. The decline was due to an assessment levied on Mono, one on Bulwer, and a report of one to be levied before long on Bodie. This report being confirmed by the secretary of the company, caused many outside holders to let go—persons who bought a short time ago from $2.10 down to $1.40 a share on $5 points.

The market opened this (Thursday) morning weak and inactive.

From the mines our advices are still of an encouraging character, although they point to from four to eight weeks yet before actual results can be determined. While traders are watching the work going on in Con. Virginia, Best and Belcher and Ophir, well-informed miners look for better results in some of the middle and Gold Hill mines. The drift on the 500-foot level from the Yellow Jacket shaft is in Con. Imperial ground about 100 feet. It looks as if they are running for the ore deposit either toward or else in Alpha. The 1300-foot level drift from the Yellow Jacket shaft is in near the Con. Imperial line. Active and important prospecting work is going on in Yellow Jacket, Crown Point, Belcher and Overman, and also in all the middle mines. From the Tuscarora and Quijotoa districts reliable private advices are hard to secure, and in their absence we refer patrons to the official reports given elsewhere. From the Bodies our advices are still of a hopeful character. The work going on in the mines is reported to be of an active and important character.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Aug. 1, $2160; Cons. California and Virginia, 2, $90,000; Hanauer, 2, $2100; Butte and Boston, 1, $31,862; Moulton, 1, $12,128: Hanauer, 6, $2700; Bluebird, 1, $14,820.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

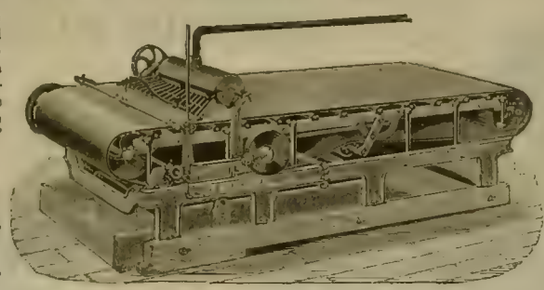
For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 41 additional Frues and more stamps have been purchased. ADAMS & CARTER.



ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, Jr.,
[Signed] Sup't North Star and Original Empire Mining Co

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PACIFIC IRON WORKS

1850. 1888.

— BUILDERS OF —

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

Hoop-Clamp for Large Tanks.

Mr. Asa R. Wells of this city has just obtained through the MINING AND SCIENTIFIC PRESS Agency a patent on a hoop-clamp which is specially adapted for use on large tanks, such as those used at railroad stations and at wine-cellars. The accompanying cuts show the device, the practical efficiency of which has been proven. *A* in Fig. 1 are the hoop ends, which are looped around the cylindrical outer ends of the heads *B*. The inner or adjacent ends of these heads are formed with hemispherical seats *b*, and in these are fitted hemispherical nuts formed with a rib fitting in a groove in their seats, whereby they are prevented from turning on that axis which is in the line of the adjustable bolt, while at liberty to move in their seats on an axis at right angles thereto. These hemispherical nuts are shown in Fig. 2 of the cuts.

Fig. 1.

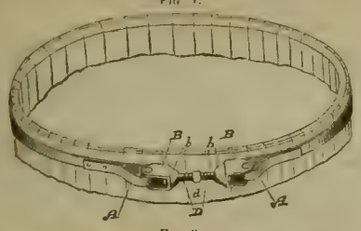

Fig. 2.

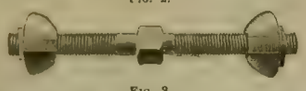

Fig. 3.

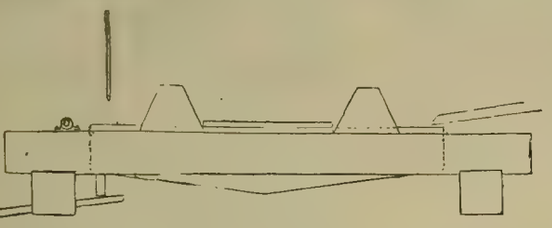
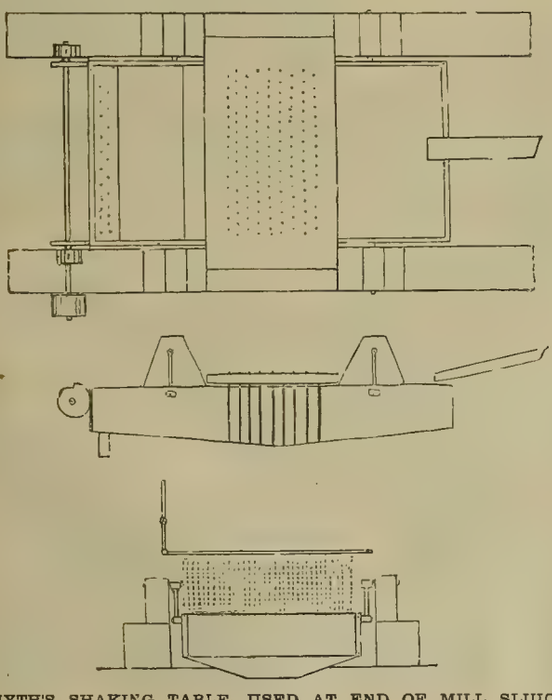
WELLS' HOOP-CLAMP FOR TANKS.



D (shown in all three figures) is the adjusting or tightening bolt of the clamp, having one end provided with a right-hand thread and the other end with a left hand thread, and at the center with a collar or wrench-hole, *d*. The threaded ends of this bolt pass freely through elongated apertures in the seats of the head and are seated in the hemispherical nuts in the sockets. An enlarged view is shown in Fig. 3.

The operation of the clamp is as follows: The ends of the hoops are looped around the heads as shown and then a wrench is applied to the central collar, *d*, of the tightening bolt. The bolt is turned, and as its reverse threaded ends work in and through their respective nuts the heads are drawn together, thereby tightening the hoop. The strain being in a curve, deflects the heads from a straight line, the hemispherical nuts through which the bolt passes turning in their hemispherical seats in the proper direction to enable the clamp to conform itself to the curvature of the hoop, thereby exerting its strength in the line of said curve instead of in a straight line tangential to it. As before mentioned, the nuts will remain steady in the direction of rotation of the bolt.



This invention supplies a great want, particularly in dry and hot climates, where shrinkage of lumber is considerable. No device heretofore in use for the purpose of tightening hoops has been satisfactory, for the reason that the draft was not straight and therefore not direct on the hoops. The advantage of a clamp hoop over a riveted hoop, particularly in heavy tank work, must be apparent to all. To tighten a riveted hoop requires tools, scaffolding and capable men. It also mars the paint and injures the iron. To tighten with a clamp, working freely, requires simply a ladder and a wrench in the hands of anybody.

Clamp bands are convenient in transportation; heavy bands for large tanks can be handled in sections without folding. Mechanically considered, the device may be described as a right-and-left draw buckle, acting on ball and socket joints. It therefore works equally free, powerfully and effectually on long or short draft and on large or small circles.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Plumas County Mines.

[From Our Own Correspondent.]

EDITORS PRESS:—Everywhere in Plumas county miners and farmers alike are speaking of the present condition of the debris question and the injunctions that rest like a pall upon their once prosperous county as thoroughly unreasonable and contrary to public policy.

With them they say it is very much as though the Sacramento valley was enjoined from plowing. Here is the little American valley, one of earth's garden spots, whose equal for hay, vegetables and certain hardy fruits can hardly be found. It was the dumping-ground for the debris for the leading hydraulic mines of the county, and yet it has done so little harm here that the farmers seem equally anxious with the miners for its continuance.

The writer has seen where great hills have been washed away and some canyons filled up, but very little good land injured. If these mines don't injure land in this valley, how can they harm the Sacramento valley, more than a hundred miles away? Yesterday one farmer said: "There is land that has paid me, many a time, more than $500 an acre for a crop of potatoes and other vegetables. Yet I told the hydraulic men to fire away with their monitors, as we had no market for the stuff and no use for the land when they were gone." In the river you can still see the same old bedrock that was bare in '49, and the same holes are there. How is it that those were not filled up if these mines have been damaging Yuba and Sutter?

The Edman Mine.

The Edman mine is situated on the Diadem lode four miles from Meadow Valley and a little more than a mile off the Quincy & Oroville road. It has a 300 foot shaft and tunnels at 45, 110 and 300-foot levels. There are 3000 feet of tunnels, besides sidings, stopes, etc. All this is timbered with heart of spruce sawed timbers 8x10 in the most substantial manner. Everything about the place is as neat as an old maid's parlor. But the main point is that several devices, apparently practical, were seen here that do not appear in use at other mines. The body of the ore is very soft and has a great deal of clay and slime mixed with it. At the mouth of the tunnel is a washing bin. Into this cars of ore are dumped and a small stream of water takes up the slime in solution and carries the ore down in sluices to the mill. This saves working not less than 50 per cent of the mass taken from the tunnel. Sulphurets predominate in much of the ore.

Huntington Mills

Of the capacity of 40 tons per day are used. For soft rock Mr. Edman thinks them far better than stamps, but they require special care, and many who make a success with stamps are not equally well pleased with the rollers. Speed should be regulated according to the rock. The harder the quartz the greater the speed. He would prefer the five-foot mill. He reports original cost of plant 30 per cent less than stamp mill of equal capacity, driving-power 25 per cent less and cost of maintenance the same. He reports cost of mining and milling, including superintendence and all items of cost, $1.90 per ton. On a large scale he estimates that cost of milling would be 80 cents per ton and cost of mining 75 cents. Maps, plans, figures, etc., indicate careful estimates. Richest rock carrying coarse gold is generally found in the footwall. Mass of milling rock averages $5 per ton. This company owns the Victor, Diadem and Red Point mines, all on the Diadem lode, and many placer claims, covering some 400 acres in all.

Greenville.

The Drury mine is working under efficient superintendence of Mr. G. Standart. They are running ten stamps and taking out fairly satisfactory rock. The writer saw several prospects taken from different parts of the tunnel and stopes, and every one showed gold.

The Indian Valley mine is soon to be started by its superintendent, S. R. Prentiss. Citizens are quite hopeful of business revival to follow the new work upon this mine.

At Crescent mills Mr. Whitney is running 16 stamps very vigorously upon hard rock brought up from a deep shaft. From these points we infer that the ore is good. The $4000 paid out monthly is certainly of great benefit to the place. A Burleigh drill goes in soon and 16 more stamps.

Green Mountain

With its splendid plant of 60 stamps lies idle a few rods up the hill from where Mr. Whitney is working so successfully. Residents report that this mine has command of a large body of ore, and that its tunnels and inclines are situated so as to enable it to work ore cheaper than any other mine in this vicinity.

It is remarked that mining superintendents are around the work in their brown duck suits more than formerly, and that mining is being carried on more like other business. When quartz mines are generally worked as carefully as a farmer must work his business to make it pay, it is thought that it will be possible to work many mines now idle. Careful, hard-working superintendents who will make rock pay that has not quite gold enough in for a bonanza fellow, are very popular here.

F. S. C.

Storage of Water.

State Board of Trade on Irrigation.

The interest taken by the State Board of Trade in the approaching visit of the Senate Committee on Arid Lands to this State has been frequently mentioned in the PRESS. A committee was appointed to prepare a comprehensive report on the condition and prospects of irrigation in California. This report has been prepared, and after revision by Mr. Estee and Gen. Chipman as a sub-committee has been given to the printers. The following is a synopsis made by the *Call* from the manuscript of the report:

The questions presented are:

What is the physical condition of California, so far as it relates to irrigation?

What amount of irrigable land is there in the State?

What amount of water can be obtained for the purpose of irrigation?

What are the advantages of irrigation?

In this connection, does irrigation pay?

What is the condition of irrigation as at present practiced in California, and what interest has the National Government in the subject of irrigation on the Pacific Coast and in relation to all that extent of country known as the "arid region," which lies west of the Missouri river?

Physical Condition and Adaptability.

California lies between the thirty-second and forty-second degrees of north latitude; it has a coast line of over 900 miles, and in width is from 150 to 200 miles, and has an area of 157,801 square miles. Two ranges of mountains extend north and south through the whole length of the State. The Coast Range, which lies just back of the ocean, parallels its shore line from one end of the State to the other. In some places this range of mountains rises in hight to from 4000 to 6000 feet, and is cut up in every direction with small but fertile valleys, fed by canyons which carry living streams of water, flowing both inland and to the sea.

The other range is the Sierra Nevadas. Its sides are covered with timber and its summits with perpetual snows. Its average hight is about 8500 feet, while Mount Shasta, in the extreme northern end of the State, rises 14,400 feet above the level of the sea; Lassen Peak, 10,577 feet; Mount Whitney, 15,000 feet; and Mount San Bernardino, 11,600 feet. Along the Coast Range the rain is excessive in winter and heavy fogs prevail during the summer months.

In the Sierra Nevada Range there has fallen as much as 80 inches of water in a single season. The depth of snow in winter averages from 8 to 20 feet.

Between these two mountain ranges is the valley of the Sacramento and the valley of the San Joaquin. They are in width from 30 to 75 miles, and their combined length is 450 miles. South of these lies another of surpassing beauty, which extends through the whole length of Los Angeles and San Bernardino counties, and in which irrigation has recently been largely and most successfully introduced.

Topographical Advantages

Will be noted when we observe that nearly every stream heading in the Sierra Nevada mountains comes from the snow belt and is supplied by the melting snows, which continue until July or August of each year.

The two great valleys before referred to are almost on a sea level. Sacramento, 89 miles from San Francisco, has an altitude of 30 feet; Bakersfield, in Kern county, distant from San Francisco 314 miles, is 282 feet above sea level. Redding, 299 miles from San Francisco, has an altitude of 556 feet. In these plains is very little rolling land, and the advantage for irrigation is great. This condition extends from Mount Shasta to Tejon Pass, a distance of 500 miles. The two valleys of the Sacramento and the San Joaquin cover an area of about 12,000,000 acres of irrigable land. The drainage is effected through the Sacramento and San Joaquin rivers.

Facilities Within the State

Is the most vital question we have to consider, because, however much irrigation may be needed in this State, if there is not an ample supply of water, it would be more than useless to attempt to carry on any extensive system of irrigation. Owing to the peculiar topographical situation of California, and the fact that for over 900 miles it borders on the Pacific ocean, the great ranges of mountains before referred to and their high altitude, there are a large number of living streams of water flowing from both these ranges of mountains into the valleys below, and which makes the water supply most abundant. Two of these streams are navigable rivers—the Sacramento for 200 miles and the San Joaquin for 100 miles. On the extreme southern boundary of the State is the Colorado.

Streams That May be Utilized.

The principal rivers that flow into the Sacramento from the east are the Feather, Yuba, Bear, American and Cosumnes rivers; there are a large number of smaller streams which head in the snow belt of the Sierra Nevada mountains, flow through the foothills across the Sacramento valley, and empty into that river. On the west side of the Sacramento valley no large rivers are tributaries, but there are a large number of creeks. Among the larger of these streams are Putah, Cache, Stony and Cottonwood creeks.

The San Joaquin valley is watered by a number of rivers. Among these are the Mokelumne, Calaveras, Stanislaus, Merced, Tuolumne, San Joaquin, Kaweah, Kings and Kern rivers. The combined water-shed of these rivers is 38,500 square miles.

The Mojave river can be successfully used for irrigation on the Mojave desert. The Mojave desert is a desert only in this sense: there is not rainfall enough to make grass and crops mature, but the soil is rich, the climate genial, and with water almost anything will grow with luxuriance. South of this is the Colorado river. It borders the Yuma desert. Wherever water has been applied on this desert the soil has proven productive. Much of this desert is below the level of the river, and some of it below sea level; and bringing water upon it would make this one of the most fertile places in the world. It is estimated that this river will successfully irrigate 1,000,000 acres of land.

The Rainfall.

The average annual rainfall at San Francisco is 23 5 inches. In the foothills of much of Northern and Central California the average rainfall exceeds 30 inches, increasing as you go north from the lower part of the San Joaquin valley, where it is about seven inches, until you reach the upper end of the Sacramento valley, where the annual rainfall is 35 inches. At San Diego it is 9.2 inches. In California fair crops can be raised from a rainfall of from 10 to 12 inches, if it comes at the right time. The annual rainfall is not uniform one year with the other.

To illustrate: At Fort Redding, one year the rainfall was 37.4 inches, the next year it was 15.9 inches. At Sacramento the rainfall one year was 27.9 inches, while the next it was but 12 inches. At Fort Tejon one year it was 34.2 inches, the next year it was 9 8 inches. Clear Lake had one year a rainfall of 66.7, and next year only 16.2 inches. Visalia one year had 10.3 inches of rain, the next year but 6.7 inches.

In the coast counties north of Monterey there has never been a failure of crops. South of Monterey, for the years 1868, 1869, 1870, and 1871, there was a noticeable drought; stock-raisers were compelled to drive their stock to the mountains or drive it north. From Tulare to San Diego in 1871 the country was almost barren of verdure. Except in favored localities there was no grass for stock; thousands of sheep, horses and cattle were lost.

Irrigable Lands.

According to survey, the area of land in California which may be readily irrigated is about 7,650,000 acres. This does not include the so-called swamp and overflow lands. But should we include these and the low foothills, there would be about 12,000,000 acres of irrigable land in the State. We should now add 1,000,000 of acres to the above estimate, which would include Mojave and Yuma deserts, Sierra and Honey Lake valleys, making 13,000,000 acres of irrigable land in California.

The area of watershed outside of the lands to be irrigated is estimated at about 3½ square miles to each square mile of land to be irrigated.

Results of Irrigation.

Los Angeles and San Bernardino counties are conspicuous illustrations of what irrigation can accomplish. The population has more than quadrupled in a single decade; lands which sold ten years ago at from $5 to $25 per acre now sell at $100 to $1000 per acre. In Placer county water has for some years been used for the irrigation of orchards and vineyards. Orchards of every variety of fruits and vineyards of every variety of grape, and nuts of all varieties, the fig and olive, all flourish in the foothills of Placer county.

The foothill country about Oroville, where water has been introduced, is no less conspicuous for its luxuriant tree growth. Within the last four years 1500 acres of orange orchards have been planted, and these trees seem to be thriving well. Fresno, once a veritable desert, is now a garden of luxuriance and beauty. Within the past few years a town has been built, which has a population of over 10,000.

Ten years ago the lands of Fresno sold at from $3 to $20 per acre; now the same land, with water on it, sells from $75 to $750 per acre, all due to irrigation. Kern county is another conspicuous landmark; more than 80,000 acres of land is being irrigated in that county.

Everywhere in California during the summer months garden vegetables are raised by irrigation. In the fall, winter and spring months in most parts of the State they require no irrigation, except such as they get from the natural rainfall. So with strawberries; this fruit is universally irrigated. In Santa Clara county alone it is claimed there are 1500 acres of land cultivated in berries, all of which are irrigated; and that there are over 500 acres cultivated in garden vegetables, which are also irrigated. Even in northern counties like Napa, where the annual rainfall is almost three times as great as in some parts of Southern California, yet strawberries, other small berries and garden vegetables during the summer months are universally irrigated.

Irrigation in Northern California.

The Sacramento valley contains large areas of bench lands, lying above the bottom lands of the river, in Shasta, Tehama, Butte, Colusa and other counties, all within reach of the water flowing down the Sacramento river and its tributaries. The creeks flowing from the Sierras are generally constant and unfailing, though diminishing in quantity through the summer.

Nature has built a reservoir in Lassen county called Eagle lake, covering an area of 35,000 acres, and in many places over 1500 feet. A tunnel 7000 feet long would tap the lake 12 feet below the surface, and by an additional open tunnel of like length the lake could be tapped 20 feet below the surface. It has a watershed of 400,000 acres in the regions of our heaviest rains and snowfall. Its elevation is 5115 feet.

Willow creek was probably once its outlet and through subterranean passages now receives its first escaping waters. This creek runs through Willow Creek valley and into Honey Lake valley.

The Susan river has a watershed separate from that of Eagle lake and about as large. It flows into Honey Lake valley; very fine storage sites are to be found near the source of this stream.

The irrigable lands of Lassen county are not far from 500,000 acres, and east of these lands in the State of Nevada is an area of like extent. The lands are rich, sandy loam, productive with water, but comparatively useless without. Here there is a region of nearly or quite 1,000,000 acres of public lands capable of sustaining a large population.

A rough calculation shows that in Eagle lake there is already stored enough water to irrigate 500,000 acres of land, and at the head of Susan river comparatively cheap reservoir sites are available to store water sufficient for a half million acres more.

North of this region lies Madelin plains, a large area of good lands if irrigated.

In Modoc county like areas are lying idle and useless, yet capable of high cultivation and sustaining a large population.

Owens Valley in Inyo County.

Inyo county is especially adapted to irrigation, particularly Owens valley. From Olancha to the head of Round valley, 100 miles, a strip of country from four to six miles in width is susceptible of irrigation. There are from 300,000 to 400,000 acres of land entirely worthless without the use of water. The Owens river carries during the summer months water enough to place at least a surface depth of 15 inches upon an area of 300,000 acres of land, without preparing catchment reservoirs. Less than 12,000 acres of land are now cultivated in Owens valley.

Los Angeles and Orange Counties.

In Los Angeles and Orange counties the length of the ditches is hundreds of miles, irrigating many varieties of soil and crops. The area of actually irrigated land in the two counties is in the vicinity of 150,000 acres. The sources of the irrigating water supply of these counties are the rivers Los Angeles and San Gabriel in Los Angeles county, the lower part of the Santa Ana in Orange county, the upper part being in San Bernardino county, and many creeks and small streams whose flow is of short duration, springs and springy lands, and hundreds of artesian wells. The rivers, except the Los Angeles, rise in the high mountains. Their waters disappear soon after debouching from the mountains, but they reappear at intervals all the way to the sea, and can be taken out at almost any point along their channels by simply running ditches into them. The average summer flow of the San Gabriel river is about 10,000 inches; that of the Los Angeles river is 3750 inches, and that of the lower Santa Ana 4000 inches. During the usual three months of the irrigating season the water is all appropriated, but much is wasted, both by seepage and evaporation, and much is allowed to run to waste. A great deal of water is obtained from springs and springy lands. The most notable instances of these sources of supply are the springs and marshy lands of Pomona, Santa Anita and San Gabriel, the marsh lands of the Rio Honda and Paso de Bartola, and those at the head of the Los Angeles river on the San Bernardino plains.

Artesian Wells.

Pomona orchards are largely supplied by them; so are those of Santa Anita and San Gabriel valleys, while the lower coast plain has hundreds of such wells. They have an average bore of six inches, depth of 150 feet and a flow of two inches. Not more than one-third of them, however, are flowing—that is, about 1500.

The Facilities for Storage.

The storage of water in the canyons may be effected by throwing dams at favorable places across the mouths of such canyons or basins as have the least wash and afford the largest capacity, and possibly of leading the water into them from adjacent streams.

Reservoirs on the bench lands may be constructed by excavating, and at much less expense than those in the canyons, and be of much safer character. There are a number of reservoirs of both kinds, of capacity varying from a few thousand to a billion gallons. One on Mormon creek is of more than the latter capacity.

The waters of the San Gabriel river would suffice to irrigate all the great valley below, coast plain beyond and the intervening range of hills to their very tops. The waters of Millard canyon and the Arroyo Seco could be made to flow over the San Rafael hills and those in and adjoining East Los Angeles. So with the San Dimas, the Santa Anita, Eaton, Tejunga, Pacoima, San Fernando, Mormon creek, Verdugo and Santiago, whose flow in the aggregate is enough to supply all the lands between them and the ocean many times over; also the Mojave, where most of the land still belongs to the Government; Big and Little

Rock creeks, Oak creek and some others, most of which show surface water only in the rainy season, if those waters are husbanded, as there are abundant facilities for doing; and in the Newhall region, the Santa Clara, the San Francisquito and the Castaic may be made to greatly increase the productiveness of the valley and the wealth of the county.

The number of acres of good land which require irrigation is, south of the mountains, 460,000. North of the Sierra Madre range, Los Angeles county shares with Kern and San Bernardino in the great Mojave desert. In these three counties, one-half of this is probably arid beyond redemption; one-half of the remainder is too rough and mountainous to be valuable for cultivation, but the remainder is mostly highly fertile soil, lying favorably for the application of water. Of this vast territory Los Angeles county possesses 250,000 acres which can be made to comfortably sustain a population of 100,000 people.

It is stated that the lowest summer flow of the Mojave river is about 5000 inches. The average flow for six months in the year, the winter and spring months, is 20,000 to 30,000 inches; during May, June and July more than 10,000, and for the rest of the season more than 5000 inches. Of this the Hesperia Land and Water Company has filed a claim of 5000 inches. The Hesperia Company irrigates about 300 acres of land, and is flooding 15,000 acres for the purpose of preparing it for cultivation with the use of less water than it would otherwise require; the remainder, properly cared for, will redeem a half million acres of now absolute desert.

Sites for Storage Reservoirs are Abundant.

The land is mostly Government land and the profits thereon would pay for enormous and elaborate works. Big and Little Rock creeks, which debouch upon the desert plain at higher elevation west of the Mojave river, are wholly within Los Angeles county. Their flow in winter is thousands of inches, and in summer is sufficient, as at present handled, to irrigate several hundred acres. Facilities for storage on these creeks are as abundant as on the Mojave. It is capable, under irrigation, of producing luxuriant and profitable crops. Artesian well-boring has proved successful in places, but the expense is great. We have an engineer's report with regard to Little Rock creek. He finds ample winter flow to furnish irrigation water, if stored, for 270,000 acres, allowing one inch to five acres. He allows for 30 inches of evaporation and finds sites and gives estimates for two reservoirs, the larger one having a capacity of 644,000,000 gallons, and to cost $125,000. There is reported from the same locality 800 acres to which water is applied; 200,000 acres irrigable, one-half of which belongs to the Government; 14 miles of ditches. Value of irrigable land, $50 per acre; non-irrigable land, $1.15 per acre; the number of artesian wells in the region, seven, with an average depth of 340 feet and average flow of 12 inches. The counties of Los Angeles and Orange have an area of 4812 square miles, or 3,079,680 acres. Their population is fully 150,000 souls, and there are nearly 90,000 acres of good land that requires no irrigation.

The land now irrigated is about 150,000 acres, and this is the basis of maintenance of 113,000 people.

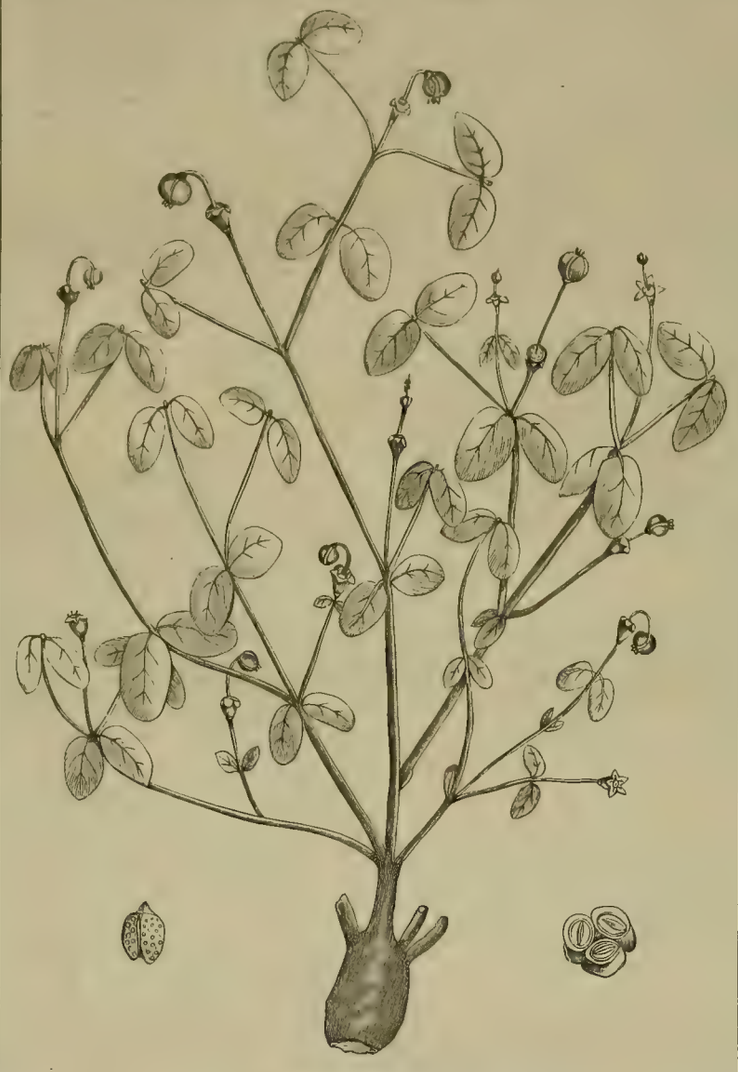
Former and Present Population.

Ten years ago the population of the counties was little over 30,000. Fifteen years ago the land on which Pasadena now stands was held at $7 per acre; in seven years it was valued and sold in large quantities at $500 to $1000 per acre. This was for orchards made possible only by a supply of moisture for the roots of the trees during the long arid season of the year. So with the great foothill region along the base of the Sierra Madre range from Tejunga and Crescenda Canada on the west through Altadena, Sierra Madre, Lamanda Park, Santa Anita, Monrovia, Duarte, Azusa, Glendora, Alosta, San Dimas, Lordsburg, Cucamonga, Rialto, Redlands and over the San Gorgonio pass into the desert at Indio, and again at Riverside and Arlington and places too numerous to mention. The region mentioned was almost worthless, and was as incapable of sustaining a population as the Mojave desert.

The remainder of the report treats of the different localities throughout the State that have been reclaimed; the manner in which the water was gathered and stored; the manner in which it was distributed and the amount required per acre in different portions of the State, taking evaporation, seeping and other losses into consideration; the value of water-rights and the division of shares; the value of storage reservoirs; artesian wells; value of irrigated lands; irrigation in certain sections a necessity; statistics showing the amount of arid lands in districts; temperatures; the interest of the National Government in irrigation—these and kindred subjects are treated in an exhaustive manner, giving information with reference to everything connected with irrigation.

PASTEUR'S METHOD IN CHICAGO.—Dr. Legario of Chicago, who spent five years at Paris as a student of Pasteur, is treating patients for hydrophobia at the county hospital according to Pasteur's method.

CENTRAL ASIA will soon boast of having the electric light, Russian engineers being busy with installations at Bokhara, by order of the Emir.



The Northern Counties of California.

NUMBER 9.

Salt Springs.

[Written for the PRESS by JAMES H. CROSSMAN.]

In these northern regions salt springs are not uncommon. Many of them contain a high percentage of saline matter (chloride of sodium) remarkably free from alkaline impurities. On several of them expensive evaporating works have been erected, and previous to the advent of the Oregon & California railroad the home market was supplied from this source. With the march of improvement, the "prairie schooners" and patient pack-mules were replaced by the "iron horse;" transportation and freight rates were reduced to so low a figure that the foreign product came strongly in competition with the domestic. These manufactories were in consequence closed, artesian wells plugged and flowing saline springs allowed to run to waste, saturating the soil and forming

AMERICAN IPECAC—Euphorbia Ipecacuanha.

what the frontiersman, trapper and hunter know as "deer licks."

In Siskiyou county the most extensive and

Largest Manufactory

Of this crystalline product was that of T. J. King, which was established in 1860. He discovered a flowing salt spring of considerable density in Shasta valley on the banks of the Shasta river, in Tp. 44, N. R. 6 W., in the vicinity of what is now known as Montague Station on the O. & C. R. R. He proceeded to utilize his find by the erection of evaporating works, using what is known as the "German system."

The plant consisted of engine, boiler and pump of sufficient capacity to raise the water of the spring high enough to distribute it over the surface of a pyramid composed of sagebrush 110 feet long by 10 feet wide at the base by 6 feet at the top by 16 feet in hight. It was built on a sloping platform 20 feet wide, which was set on a sidehill at a sufficient elevation to place a similar structure below. The natural water of the spring thus elevated and distributed, slowly trickled through the interstices of the brushy mass, while a constant circulation of the heated and rarefied air that regularly blows during the summer months in this region, caused a rapid evaporation, the saturated saline water falling on and flowing from the platform into a trough, thence to another and similar pyramid where the same process was repeated. Thence it went to a tank and from the tank was drawn off to pans, when the work was completed by artificial heat, and the commercial product ready for the market without other refining process. The demand for this product being greater than the supply in 1872, the proprietor, Mr. King, decided to increase his works by boring for a greater

Artesian Flow.

He erected the ordinary plant, using a 4½ inch bit with which he sunk through the several strata illustrated in the section presented on page 133, and at a depth of 107 feet, tubed his well. At this point the water contained one per cent of saline matter. His object in tubing was to prevent the admission of extraneous matter other than that encountered in the regular order.

At a depth of 356 feet thermal water was encountered with a jet four feet above the well-curb, showing an increase of pressure head as well as of saline matter. At 409 feet the flow increased to 143,995 gallons daily, pressure head increasing. The drill was thrown out. In the pressure-test tube the water raised 16 feet above the curbing. The flow was constant, showing increased pressure, and at a hight of 30 feet in the tube the flow was spasmodic and intermittent, demonstrating that the maximum pressure-head point had been reached and that the water had found its level. At 426 feet the drill sinks through a subterranean channel, resulting in a strong flow of both water and natural gas, with a water-jet five feet above the curb. The saline density, as shown by hydrometer, was four per cent. At a depth of 490 feet the drill enters another subterranean channel, where we reach the maximum pressure head and flow of water as well as the maximum flow of natural gas. This gas when ignited burned fiercely until extinguished by a gale of wind. The water overflow was covered with an oily scum that also took fire, covering it with a sheet of flame.

The drill then bored deeper through 118 feet of amygdaloid, the water gradually losing its saline properties. At 665 feet a bed of magnetic iron was encountered of so strong a magnetic power as to adhere to the drill; and at 696 feet the underlying or bedrock formation was reached. The daily flow of water at this point was 150,000 gallons, but pure, soft, and free from all mineral substances. Of the correctness of the above statement there can be no question. It was taken from the record-book of the work as it progressed, kept by Mr. King, the owner of the well.

This gentleman furnished the data and contributed to the California State Mining Bureau samples of the strata that were cut by the drill. The above data is of importance and of great interest to the scientist, student, farmer, merchant and manufacturer, particularly so when it is known that the western boundary or rim-rock of the Shasta valley basin, as it dips easterly under the surface, is overlaid by a sheet of carbonaceous shale five feet thick, in which seams of a good quality of lignite (coal) occur. The shale lays at an angle of from five to eight degrees, dipping into and under the basin. Strong evidences have been found of a coal measure of value on which an incline has been sunk to a depth of 45 feet, when the influx of water from want of proper machinery caused a cessation of work. The artesian well, of which we publish a section, was not bored in what was believed to be the center of the basin. What other wells might do is a problem that will be solved at some future day.

Shasta Valley

Of Siskiyou county is situated at an elevation of from 2500 to 2600 feet above the level of the sea. It is from two to five miles in width easterly and westerly, with a longitudinal extension from north to south of about 15 miles. It is bounded on the east by that lava-covered range forming the plateau known as the lava-fields, and on the west by a low mountain range which at the point where the strata dip under the valley is composed of a silicious rock (quartzite) dipping east, while the strata bounding the valley on the east dip west and into the valley, thereby forming a basin-shaped depression filled with the several strata of subsoil, sandstone, etc. Some of this is fossiliferous, containing fresh water and marine shells as illustrated in the section.

The deep subsoil has been largely formed from the decomposition of the eruptive and volcanic rocks that bound it on the east, which contain alkaline minerals that possess wonderful fertilizing properties. These, when applied on the soil, produce heavy crops of the cereals. Lands thus treated are particularly noted for their yield of succulent grasses, alfalfa, timothy, etc., affording pasturage and feed for a large number of both horses and cattle the year round. These lands are particularly adapted for dairy purposes. The butter manufactured in this valley is of a superior quality. The color is golden and the flavor aromatic and agreeable to the taste. It compares favorably with the celebrated Goshen of the Empire State. The valley is not subject to the extremes of heat and cold, and is capable of supporting a large population. On the Klamath river the

Detrick Spring

Has also been a producer. It is situated two miles from the river in a formation of blue sandstone and micaceous schist. It affords a steady flow of two miner's inches. The hydrometer shows five per cent of saline matter. The system adopted for evaporating is the "Brush" with evaporating-pans. Within a circumference of one mile, ten saline springs come to the surface. The salt manufactured at these springs is sold on the ground for one cent per pound and is extensively used for dairy purposes, being a pure chloride of sodium and free from all impurities. Siskiyou possesses other localities of lesser note where saline springs occur.

Other Resources.

Del Norte and Modoc are also well supplied with perennial saline springs, while Humboldt and Mendocino counties contain a belt of country near their shore lines, of undetermined width, in which occur not only numerous springs of saline and medicinal waters, both hot and cold, but large areas of hydrocarbonaceous fields that contain petroleum, asphaltum and natural gas, as well as sulphur and coal. These sources of mineral wealth are entirely undeveloped and their great value but little understood by the owners on whose lands they occur. Their attention is as yet almost wholly directed to the manufacture of lumber from the immense forests of redwood that occur in this region, and other industrial pursuits incidental to this business. Mining, as an industry, for gold and minerals of an economic value, is let severely alone. The mineral resources of the earth are neglected for its vegetable products. There is no portion of our State where a detailed geological and mineralogical survey is more needed and more beneficial than in this locality.

American Ipecac.

Two species of *euphorbia* share the name "wild ipecac." One of these, *E. ipecacuanha*, is shown on this page, the engraving being a reproduction from Dr. Vasey's series of medicinal plants, published by the Department of Agriculture. This latter species is most often given the distinctive appellation "American Ipecac." Both species are herbaceous perennials. The former ranges over the country east of the Rocky mountains; the latter is confined to sandy woods and shores near the sea coast from New Jersey to Florida. According to Dr. Vasey's description, the *E. ipecacuanha* sends up numerous slender stems from a thick, irregular root, which sometimes penetrates several feet in the sand in which it grows. The stems are erect or procumbent, smooth, from six inches to one foot long, and fork or divide in twos several times. The leaves are very variable in size and form, being sometimes narrowly linear, sometimes oblong or obovate, and from half an inch to an inch and a half long; they are opposite, sessile, smooth, and entire. The flowers are single, on peduncles an inch or more in length, proceeding from the forks or axils.

Like all the species of the genus *Euphorbia*, the stems abound in an acrid, milky juice.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Aug. 10: The concentrators at the additional stamps to the Wildman mine are of the Triumph make, with the Blaisdell belts, which have a corrugated surface which is thought by many to have an advantage over the smooth surface. There will be an expert put on each concentrator in a few days for a run of a month, so as to make a very thorough test. Sinking at the North Star is about finished. They have attained a total depth of over 800 feet, and have the sump to sink yet, after which drifting will be inaugurated. Most likely they will drift in an easterly direction first, and if the result does not prove satisfactory the footwall will be tried.

MINE SOLD.—*Ledger*, Aug. 10: The Mandich Bros. & Leggett sold three claims this week to Jas. Treadwell and Geo. Pickett of San Francisco, for the sum of $6000. These claims are located near each other, about six miles above Sutter Creek. One of these was bonded to S. D. R. Stewart last year, who put up a six-stamp mill and other improvements. A boulder appeared in the ledge which failed to show gold in paying quantities, and Mr. Stewart shut the whole thing down and forfeited the property at the expiration of the bond. The Mandich boys then went to work on it and after extending the tunnel a short distance, the pay ore came in again. The new purchasers examined into the property thoroughly before buying, and were fully satisfied of its value. They are both mining men. Mr. Treadwell at one time owned the famous mine on Douglas island, Alaska, now running 240 stamps, and which was named after him. They intend to develop the Mandich mines in good shape, without delay. A tunnel is to be run at a point considerably below the present tunnel, so as to tap the ledge 250 feet from the surface.

MISCELLANEOUS.—The Plymouth Con. is practically closed for the present. They are keeping the water down, and that is about all that is going on about the works. No one seems to be able to give any definite information regarding the alleged cave. There is some talk that it is the intention to take down the new part of the Pacific mill—the last addition of 40 stamps—and ship the same to Mexico. It was also reported that a winze was to be sunk in one of the lower levels of the Pacific in search for further pay ore. Altogether the affairs of this property seem to be considerably mixed, and parties interested, whether in New York or on the ground, appear to be in blissful ignorance as to the present or future operations of the company. The water for some cause or other is short at the Bunker Hill, and all the men are laid off except a few repairing the shaft. The South Spring Hill is only running 10 stamps and the Keystone 20, the water not being sufficient to run full blast. A party from San Francisco has been surveying the Kling claim for the past few days. It is understood it will be sold pretty soon.

Calaveras.

COPPEROPOLIS.—Calaveras *Prospect*, Aug. 10: At the Union copper mine 75 men are employed at present, and more hands will be put to work as soon as the shaft that caved some time ago is cleaned and retimbered. About one-third of the work of retimbering has been completed already. While the work of overhauling the machinery on the several shafts, retimbering, etc., is going on, the low-grade ore is being removed from the dumps to leaching floors, about 3000 feet from the mine. There is a noticeable revival in business in the town of Copperopolis.

Inyo.

THE OLD DOMINION.—Inyo *Index*, Aug 7: Such is the title of a well-known mining property of Beveridge district, and was formerly known as the Borago Broncho. It belongs to ex-County Clerk Hunter and Thos. McDonough, both gentlemen being Cerro Gordo miners from 'wayback in the middle 60's, and is situated just across the summit of the three highest points of the Inyos. The ledge is situated some six or seven miles south of the noted Keynot mine, and nearly the same distance north of the great argentiferous-galena deposits of Buena Vista peak or Cerro Gordo. The Borago Broncho was originally opened by an incline shaft to a depth of 70 feet, and steam arastras were put up for handling such part of the ore that contains gold free to the amalgamation process. Mr. McDonough's developments this season, at a point comparatively on the surface, are, however, the most important. It is a mass of ore and matrix full eight feet wide. A shipment to Melrose of eight tons of the ore is expected to show up $100 per ton in gold.

MAXIM.—Inyo *Independent*, Aug. 10: On Thursday Mr. McConnell and others went out to the Maxim to start the mill. When they arrived there they found Arthur Smith and Neil McLean in possession of the premises, who informed Mr. McConnell that they intended to hold the same until their wages were paid. After some dispute their claims were settled and McConnell took charge of the works. There is considerable ore on hand to work.

CERRO GORDO.—As was stated in last week's issue, the sale of the Union mine at Cerro Gordo has been effected and operations will soon be commenced there.

WATTERSON'S NEW MILL.—Inyo *Register*, Aug. 10: As mentioned heretofore, Geo. Watterson is putting up a small quartz-mill for gold ores near the lower end of Long valley on the east side. Chas. Wonacott has the work in hand, assisted by Chas. McKay and Woodworth of this place, who have just gone up for that purpose.

Mono.

MONO.—Bodie *Free Press*, Aug. 12: During the past week south drift from joint winze from south drift, 1000 level, was driven 20 feet. Southwest drift, 1200 level, was advanced 10 feet. West crosscut from south drift, same level, was extended 20 feet. There were employed 17 miners, 1 foreman.

THE BODIE CON.—Jointly with Mono west crosscut from joint upraise from the south drift, 1200 level, was advanced 20 feet.

Nevada.

QUARTZ STRIKES.—*Tidings*, Aug. 6: J. G. Hall and Paul Quick are taking out quartz from a ledge accidentally discovered in the center of the street in Badger Hill. It has been traveled over for 30 years. A crushing paid $71 per ton. The old ledge at the Banner mine has been found again by men in the employ of J. E. Brown and John Spaulding, who are the lessees of the property. Where encountered, the vein is 11 inches wide and the ore is rich in free gold, sulphurets and galena. Extensive developments will follow.

Plumas.

THE ALTONA.—Greenville *Bulletin*, Aug. 8: The Altona mine, owned by T. F. Emmons, is situated between the Cherokee and Green Mountain mines. It runs into the main hill. Judge Emmons has pushed the tunnel ahead 60 feet since he began work on the vein this year. This drift has been cut on the hanging-wall side of the ledge. A crosscut is now being made toward the footwall. The miners have gone six feet but the wall has not yet been reached. It is thought that the vein here is about 15 feet wide. The quartz is generally dark colored and easy of extraction. Mr. Emmons says it prospects well. This report is confirmed by experieaced miners who have prospected the quartz.

TO MAKE A TEST.—More & Owens have concluded to make a test of the quartz taken from their claim in the vicinity of Rush creek. They have secured five pack animals and the necessary equipments, and will pack about 100 tons to the Hoffner mill on Rush creek, about 1½ miles from the mine. They expect to deliver 2½ tons daily. They have a very large body of ore in the vein, and it is expected to yield $15 a ton. The work of pumping out the shaft in the Indian Valley mine was begun last week and will be prosecuted with vigor by Mr. Prentiss, the superintendent. The work of driving the tunnel ahead continues.

Shasta.

A RICH STRIKE.—Redding *Democrat*, Aug. 14: Last Wednesday we saw a sample of gold ore that was glittering with the yellow metal, about 40 pounds of which was brought to town by Whit George. For three years or more he has owned a half interest in a location—the first extension east of Senator J. P. Jones' mine on Clear creek, half a mile south of old Muletown. John Jollie, another old prospector, once owned the other half, but a year or so ago sold out his interest for a nominal sum. Last summer A. S. J. McCoy went in with Whit on the prospect and sunk about 30 feet, and it failing to pan out, McCoy abandoned his interest. But Whit felt confident he could find a good ore chute on the claim, so six weeks or more ago he got his uncle, Dr. Rohm, and Sheriff Hopping to take an interest with him, and started a new shaft about 50 feet south of the first prospect hole. A week ago yesterday, at a depth of 34 feet, he encountered 30 inches of very rich ore, samples of which he brought to town which would mill at least $2500 to the ton. The vein is well defined, but how long this rich ore will hold out remains to be proven.

OLD DIGGINGS DISTRICT.—Redding *Free Press*, Aug. 10: F. P. Satterlee started up the Central mill on Monday. Hart and Fleming have struck very fine rock in their lower level. The road from Star gulch to Walker Brothers' new mill-site on the bank of the Sacramento river is finished. The Mammoth mine is working day and night on their lower tunnel, which is showing signs of improvement all the time. It is rumored that some parties are negotiating for the Reid mine, also the Garfield, which is an extension of the Mammoth.

Sierra.

TUNNEL.—*Mountain Messenger*, Aug. 10: French Co., Howland Flat, are pushing ahead their bedrock tunnel, two shifts, three men on each; and work progresses favorably.

KANAKA RAVINE.—The persons prospecting for quartz on Kanaka Ravine found some very good quartz in the tunnel they are running, last week. They think they have the old Kanaka ledge sure. Henry Binning was here from Alleghany last Wednesday, and reported that the ore at the West End ledge, Kanaka creek, owned by W. G. Montgomery of Ohio, prospects very well in free gold. Only one wall has been found, and the other will probably be reached next week, a width of 20 feet.

GRAVEL.—Riffle Co., Grass Flat, are employing 25 men, and taking out good paying gravel—about seven dollars a load.

San Diego.

JULIAN AND BANNER.—*Sentinel*, Aug. 9: D. D. Bailey is extracting very good ore from the Hidden Treasure mine. J. O. Bailey is shoving the lower level of the Ready Relief in, making slow but sure progress. The dump of the Warlock mine looks like a lumber yard. Timbering of the mine will soon begin. The lower level of the Ready Relief mine is now in over 500 feet and shows splendid ore at its face. If the tunnel work on the Don't Bother Me mine was all put in one big tunnel it would be over 1000 feet long. Colonel Gardner is in 100 feet with his tunnel. This leaves 75 feet more for him to go and then Julian will have another big mine. The Richmond tunnel is in 30 feet. The boys have hard iron rock to contend with, but this does not discourage them, as they are miners and not afraid of hard work. The first contract on the Washington mine is completed and T. J. Daly, one of the owners, who is here, informs us that another contract will be let to sink it 100 feet deeper, work to commence at once. W. L. Fredericks was up from Banner Wednesday, and placed in our cabinet a specimen of gold quartz from the Cincinnati Belle weighing about four pounds that will attract the attention of all comers.

STONEWALL.—Governor Waterman was in town yesterday, but could only remain a few minutes. He reports things humming at the Stonewall. He will soon have his new mill up and pounding out the precious dust in endless quantities. He informed us that they struck richer rock on Wednesday than ever before, and plenty of it.

Tuolumne.

BONANZA.—Tuolumne *Independent*, Aug. 10: The Bonanza mining company are making preparations for the sinking of a shaft on the Bonanza mine. The shaft will be 150 feet deep, and will greatly facilitate the working of the mine at reduced expense. The contract for sinking the shaft has been given to the following gentlemen: Messrs. Jas. and Ed. Fitzgerald, Lafayette Carr, Jas. Daley, Fred. Greiner and Frank Du Pratt.

MARY ELLEN MINE.—Sonora *Democrat*, Aug. 10: The new stamp-mill on this mine on the Tuolumne river is rapidly approaching completion, and will soon require to be enlarged. The vein is large and well defined, the grade of the ore, in free gold, high, and that of the sulphurets unusually so—higher than found in any other mine in this section of the State—assays showing results of nearly $2000 per ton. Another chute of rich ore has just been found.

NEW ALBANY.—The reports from this mine are very satisfactory, the body of ore lately developed on the north end of the mine holding out well. The grade of the ore in free gold is generally good and some parts of the ore body show exceedingly rich, giving an average value in the mill that is gratifying to the owner, Dr. John Walker of Sonora, and his numerous friends. The ore of this mine is very peculiar in structure, having a laminated character built up of plates or flakes of quartz bound together by a silicious or quartz paste. The sulphurets from this mine show considerable galena with the iron and copper, and also a marked percentage of silver sulphurets. The assays made by Mr. Louis Blanding of Sonora and also in S. F. show the sulphurets to be a valuable and profitable addition to the free gold of the mine. The fine ten-stamp water-mill with free water in abundant supply for any number of stamps is in steady operation.

RIBBON ROCK.—The fine water-power mill on this mine, situated near Columbia, has been completed and is now in operation—the work having been done in an unusually short time. The management deserves credit for the rapid yet solid work of construction. The mine promises well for early and satisfactory profits. The ore is of good quality and the vein large and lasting, and an addition to the mill will soon be needed to handle the large output of ore.

SULPHURETS WORKS.—Operations on the ten-stamp mill and sulphuret reduction works of the Golden Gate mine, and also on the Maltman Sulphurets Works situated near town, are being steadily and rapidly pushed to completion. Such works have long been needed and will be an important addition to the industries of the county.

EAGLE.—This mine, situated in the northern part of the county, is looking well under the superintendence of Dr. Tibbetts, and the new steam mill now being erected will be completed at an early day and add another to the bullion-producers of the county.

ELECTRICITY.—There is a move on foot to replace the steam-power of the Buchanan mine and mill with electricity.

NEVADA.

Washoe District.

BEST & BELCHER.—Virginia *Enterprise*, Aug. 10: The northwest drift on the 455 level is in vein porphyry, in which are seen numerous streaks of quartz. The northwest drift on the 1000 level is in a formation the predominant materials in which are porphyry and clay.

CON. CAL. & VA.—The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. Some good ore is being developed on the 1650 level in the upraise north of the winze. The shipments to the mills are of about the usual quantity and quality of ore. Following is the official statement of the July ore and bullion product: Total ore worked, 10,941 tons; total bullion produced, gold, $111,426.70; silver, $134,381.67; total, $245,808.37; average yield in bullion per ton, gold, $10.18; silver, $12.28; total, $22.46; average assay value of the ore per ton, $30.54.

BELCHER.—Have stoped the 1100 and 1200 south drifts and have resumed work in the old 1300 raise to connect with the 1200 drift. Are also sinking in the 1200 drift to meet it. The 200 east crosscut is out 32 feet. Are just entering the ledge, which so far assays from $4 to $14 per ton.

MEXICAN.—West crosscut No. 1, from the main north drift, 1465 level, is still being advanced into a mixture of clay, quartz and porphyry. The face of the crosscut is wet, which in connection with the quartz disclosed, is a favorable indication.

CHALLENGE CON.—The joint Confidence, Challenge and Imperial north drift on the 500-foot level is now in 841 feet from the Yellow Jacket shaft, 21 feet having been added during the week. The face shows quartz giving low assays.

YELLOW JACKET.—Continue shipping 100 tons of ore daily, showing an assay value of $25 per ton. A good deal of exploring work is being done at various points and some fair milling ore is being found.

SIERRA NEVADA.—The main east drift (joint with the Scorpion) on the 520 level is out nearly 1000 feet. The face continues to disclose numerous clay seams from which there is a slight flow of water.

BALTIMORE.—The usual progress is making in the drifts and crosscuts on the 338 and 225 levels. At several points on these levels deposits of good milling ore have been developed.

HALE & NORCROSS.—On the 500 level the upraise from the face of the east crosscut was advanced 13 feet, making its total hight 25 feet. The top of this upraise is in good ore.

CONFIDENCE.—The progress of the joint Challenge, Confidence and Imperial north drift on the 500 level is described in the letters of the Challenge and Con. Imperial mines.

CHOLLAR.—The usual exploring operations are continued in a formation of a favorable character, but no change of importance has taken place at any point since last report.

OCCIDENTAL.—Are extracting over 300 tons of ore a week. It comes from the 350, 400 and 550 levels. The mill is doing good work and the battery assays are satisfactory.

OVERMAN.—Cut some fair grade ore above and west of No. 3 southwest stope. A good deal of virgin ground lying on the west of the old stopes remains to be explored.

CROWN POINT.—The raise above the 350 level is still in quartz that carries some metal. The south drift on the 700 level is making good headway in favorable ground.

POTOSI.—The 750 level south drift is showing more quartz. The 550 level west crosscut continues in clay and porphyry with some small seams of quartz.

CON. IMPERIAL.—On the 300 level the north drift is showing a favorable formation of quartz and porphyry in the face. The joint Confidence, Challenge and Imperial north drift on the 500 level is in 841 feet from the Yellow Jacket shaft, 21 feet having been made during the week. The face shows quartz giving low assays.

JUSTICE.—The mill is kept running steadily on ore of a good quality. The ore-producing sections of the mine show improvement at one or two points.

UNION CON.—West crosscut No. 2, from the main north drift, 1465 level, is passing through a promising formation of quartz, clay and porphyry.

SAVAGE.—During the week they started a prospecting drift east from the sixth floor of the old stopes and advanced same 32 feet.

SEG. BELCHER.—On the 1100 level the south drift is in quartz that gives good assays. The pay streak is about a yard wide.

SILVER HILL.—The 800 level northwest and northeast drifts are showing no important change since last report.

NORTH OCCIDENTAL.—The south drift from above the 300 level is in vein material of a favorable appearance.

BULLION.—Nothing new in 750 explorations except that the ground is "breaking" better than heretofore.

ANDES.—The exploring drifts are encountering frequent spots of quartz that carry more or less metal.

ALTA.—Mill in full operation and 925 level stopes yielding the same quantity and quality of ore.

UTAH.—The north drift from the main west drift on the 600 level continues in vein porphyry.

ALPHA.—On the 500 level the crosscut still shows in its face quartz that carries some metal.

WARD SHAFT.—Fair progress is making in the work of opening up the 800 level.

NEW YORK.—The raise from the 800 level is in a streak of ore that is growing stronger.

BENTON.—The work of grading for a hoist plant is being pushed to completion.

OPHIR.—The raise in the east drift on the 1465 level is still in porphyry.

Aurum District.

SHIPPING ORE.—White Pine *News*, Aug. 10 Davis & Sanford of Aurum are shipping 95-ounce ore to Salt Lake City. They have a fine property and ought to have a mill to reduce their ore at home.

Big Six Miles District.

IMPORTANT MINING SALE.—Elko *Free Press*, Aug. 10: An important mining transfer took place Wednesday by which the St. Helena Smelting Co. of Trinidad, Colorado, becomes the owner of some fine mining property in Elko county. The property consists of three claims, situated in Big Six Miles district, 11 miles southeast of Toano, and was discovered and located some time ago by Mr. A. P. Shively. The ore runs in silver and lead and there is said to be a large body of it already in sight. Mr. Mark A. Luckenbach, the gentleman who completed the bargain for the property with Mr. Shively, has a very high opinion of the purchase, and has set a force of men at work to open it out. He is agent for the St. Helena Smelting Co., and a mining engineer of high repute. This sale is of great importance to Elko county, as it will be an entering wedge to the development of many of our rich mining districts. Once let Colorado mining men, backed by Colorado capital, get a foothold in eastern Nevada, we will have good times again. We have the mineral, but lack the necessary capital to properly uncover it.

Cherry Creek District.

BULLION.—White Pine *News*, Aug. 10: The Merrimac Co.'s employes had a pay-day this week. The company continues to ship the usual quantity of rich bullion every week.

Eureka District.

TRIBUTERS.—*Sentinel*, Aug. 10: Six tributers in the Lord Byron, one of the series of mines belonging to the Ruby & Dunderberg Co., took out 64 tons of ore last month that assayed over $100 per ton. Three shifts of men are working in the upraise of the Diamond mine, and are making good progress. They expect to have the work completed by the first of the coming month. Joe Mileno sent 6½ sacks of ore to the furnaces some time ago. The shipment was composed of high and low-grade pieces of rock, representing a fair average of the ores of all the mines on the hill. The working result was $276 per ton in silver and gold.

Garfield District.

HARD TIMES.—Inyo *Register*, Aug. 10: Wallace Miller returned here this week from Garfield, Nevada, where he has been at work for some months past. Work in the Pamlico, the principal mine, is suspended on account of a lawsuit just begun, involving the property. Water is very scarce in that camp, as well as throughout that country generally, and this fact has tended to make times harder than they otherwise might have been.

Pioche District.

RAYMOND.—Pioche *Record*, Aug. 3: Work at the Raymond shaft during the past week has progressed far more than was expected. It was thought a week ago yesterday morning that when the big pump got steadily at work, the 12th station, with good luck, would be cleared of water in about a week, but in this they have been agreeably surprised. At the 12th station the water stood about seven feet deep, decreasing slightly in the drift, which is run on a very slight raise. The pump was set steadily at work a week ago last night and in 16 hours the 12th station was pumped dry. An examination of the level then was made. It was found to be in good condition for 1100 feet, at which point a cave in porphyry ground had occurred, blocking the drift and backing up the water. Within a few days the drift was cleaned and this cave removed, when 40 feet beyond, another cave was encountered, the work of clearing which is now going on. This point is but a comparatively short distance from the Black ledge, and the volume of water behind the present cave cannot exceed that which has already been removed.

YUBA.—The work at this mine for several weeks past has consisted of retimbering the shaft and of enlarging and timbering up the Burke tunnel preparatory to extracting ore from the mine. The Yuba is to be worked through the Burke tunnel which taps the shaft 340 feet from the surface, where a station has been put in. At present no development work is going on below. A line of track will run from the Burke tunnel directly to the reduction works, and one handling of the ore only will be necessary. The machinery at the reduction works was set in motion last week and found to run

smoothly and satisfactorily. The leaching department is expected to be in operation by next Wednesday. A. H. Godbe will leach the black ore now on the Raymond dump, of which there is about 2000 tons. He has been experimenting, and feels confident of working it successfully by the leaching process.

Tuscarora District.

BELLE ISLE.—*Time Review*, Aug. 9: West crosscut from north drift, 250-foot level, extended 18 feet, passing through 12 feet of vein matter.

GRAND PRIZE. 400-foot level: West drift from north crosscut extended 15 feet, and west crosscut from south drift 14 feet. No change since last report in either place. Seventy-seven tons of ore have been worked during the week, of an average assay value of $223.06 per ton. The new pump on the 400-foot level is now in operation and doing splendid work.

NORTH COMMONWEALTH.—Joint crosscut east, 225-foot level, extended 20 feet. The face indicates the approach to the vein. East crosscut No. 1 on the 100-foot level extended 13 feet; ore seams still showing in the face.

COMMONWEALTH.—Stopes are looking well throughout the mine. Average battery pulp $220.18. Bullion shipped during the week $12,505.67. Crude bullion on hand $7000.

DEL MONTE.—East crosscut No. 1, 100-foot level, extended 7 feet. The face continues to show high-grade ore, a portion of which is black metal.

NEVADA QUEEN.—South drift from Commonwealth, 150-foot level, has been advanced 10 feet, still showing small seams of high-grade ore.

NAVAJO.—Upraise south end, 350-foot level, extended 8 feet, total hight 72 feet; the upraise continues to yield some rich ore.

NORTH BELLE ISLE.—Fair progress has been made in sinking the shaft below the 400-foot level.

Tybo District.

TUNNEL.—Belmont *Courier*, Aug. 10: The Gilmore Brothers at Tybo are prosecuting work on their mine, known as the F. G., with satisfactory results. They have run a tunnel 300 feet easterly on the ledge and are now at a depth of 140 feet vertical, with a ledge 18 inches in width. The ore has changed from a silver ore at the surface to a gold ore at this depth. Assays from the face of the tunnel show an average of $31.50 in gold and 12 ounces silver. The change from silver to gold is unusual but extremely satisfactory to the owners.

THE MA ALTA MINE at Tybo is being worked by a full force of men and good ore steadily extracted. There is at present on the dump 700 or 800 tons of high-grade ore. The ore will be soon shipped to Eureka for reduction. It takes a good mine these days to stand the expense of shipping ore by team such a distance and then bearing the discount.

ARIZONA.

DOS CABEZAS.—Silver City *Enterprise*, Aug. 10: The Dos Cabezas district, north of Apache Pass, in the Chiricahua mountains, Cochise county, Arizona, is again attracting attention. In 1880-81 this camp had quite a boom, and was in a fair way to attain prominence as a producer. A. E. Fay published a newspaper there and made known to the world the wonderful richness of the country, which attracted many mining men. Fair prices were offered for many of the properties, but the owners all held their claims at fabulous figures; the result was, that moneyed men did not invest very extensively, and the claims remained in the possession of their original owners. A number of the best claims have remained in the possession of their locators, who having stayed with the camp through all these years, will probably now be able to realize on them. Most any of them would now sell for less than a million, having realized that while quartz may be very solid food, it is not easily digested. The camp contains some immense ledges of low-grade gold ore as well as mammoth copper veins, is delightfully situated and is easy of access.

QUEEN BEE.—Mohave *Miner*, Aug. 10: The lessees of the Queen Bee mine have put on a double shift and are pushing development work.

SAMPLING WORKS.—The sampling works this week have run through the following lots: Theodore Meyer, lessee on C. O. D., 1½ tons high-grade ore, C. O. D. mine, 52 tons of ore. Rogers and Fisher, a small lot from the Smuggler; Wm. Garnt of Hackberry, a small lot of ore from Carey and Miller's claim. Four carloads of ore will be shipped this week.

THE O. K.—Messrs. Patterson, Rowe and Fox are working on the O. K. in Gold basin and are taking out some fine ore. The ore is taken to Patterson's mill and is being run through the arastra. Three miners are at work in the mine and Sol Rowe runs the arastra.

SHIPMENT.—Frank L. Smith shipped this week five carloads of ore to the Rio Grande smelting works at Socorro, N. M. The shipping of ore direct to the smelter is new in this county.

THE NEW DISCOVERIES at Hackberry are developing better than the discoverers anticipated, and Hackberry may resume its old-time liveliness before another year rolls around.

THE Keystone mill, Mineral Park, has received the carload of salt for which they have been waiting patiently, and the mill will soon be running again.

TO SUSPEND.—It is said the Monarch M. Co, will again suspend operations on the Golden Gate mine in Lost basin.

MICA.—Florence *Enterprise*, Aug. 10: Paul Siebert, an old prospector, has been hunting over the Maricopa mountains two months or more in search of mica, and he thinks he has found it. He has traced the deposit for 3000 feet and has taken up two full claims, each 1000 feet by 600. The mica occurs in a rock that resembles sandstone and marble both. This must be carefully split open in order not to shatter the isinglass, a mistake made over two years ago by some Tucson parties working in that section. These claims are probably in the vicinity of a very strong vein of mica discovered by Mr. David Moe last fall, which were located by himself, Ed. O. Smith and others of this place about two months ago. The indications point to the existence of immense bodies of mica of excellent quality that can be mined in large-sized sheets.

COLORADO.

NOTES.—Idaho Springs *News*, Aug. 9: A number of lessees are at work on the Humboldt. The Silver Queen shaft is being sunk another lift. The boys leasing on the Esmeralda shaft are sending some rich ore to the surface. Owens & Son made a shipment of a carload of ore from the Silver Queen yesterday. The Lamartine continues to ship heavily. 11 ore-sorters being kept busy preparing its production for shipment. Bowden & Co. keep several sets of lessees constantly at work on the Tropic, which is shipping considerable mineral. During the month of July there were shipped from the station at this place, 117 carloads of ore, containing a total of 3,086,200 pounds. Callow & Son made a shipment from the Grand View a few days ago, netting them a handsome sum. Kooken & Brown have had the good luck to bring their shaft on the Casino into mineral again. The pay streak in the bottom averages about three inches solid. Some Georgetown parties have secured a lease and bond on the Bunker Hill, formerly the Red Lion, on Ute creek, and have begun extensive development work. Ute Creek is on the boom and a great deal of activity prevails in that lively camp. During the month ending July 31st, W. J. Chamberlain & Co., ore samplers, shipped 1,230,000 pounds of ore carrying 21,340 ounces silver, 705 ounces gold, 42,000 pounds lead and 4000 pounds copper. The bins at Berry's concentrating and sampling works at present contain over 150 tons of ore from the Dove's Nest. The mill is treating an average of 16 tons per day, from which four tons of concentrates are obtained.

SYLVANITE.—Elk Mt. *Pilot*, Aug. 10: Supt. Murphy informs us that he is arranging to start the air-compressor drill in the Sylvanite tunnel at once, and that he expects to have 20, and probably 40, men at work on this mine all winter. Mr. Baker is securing funds to work the mine. No ore will be taken out, but it is proposed to put the mine in good shape by running tunnel to the vein and doing other development work. The tunnel will have to be run about 1100 feet to cut the vein, and with the air-drill about eight feet per day can be driven.

IDAHO.

THE ELK HORN.—Boise City *Statesman*, Aug. 10: Recent developments at the Elk Horn mine made upon the parallel or accompanying vein to the main lode here brought into view a fine body of good ore which will pay well as soon as the improved facilities for crushing, now under way, shall be in place. The Boston syndicate which now owns the Elk Horn is becoming every day better and better satisfied that it has been fortunate in making a good investment. Those who are well acquainted with the Elk Horn, and who know the exact condition of the main lode as it was left several years ago when operations upon it were suspended on account of water accumulating in the mine, all testify to the fine body of rich ore then in sight on the lode. The present management is pushing a crosscut from the lower tunnel in the direction of the main lode, and the character of the rock through which the crosscut is passing gives every indication of a near approach to a rich lode. In working the accompanying vein by the lower tunnel, some $40,000 have been taken out within the past few months. It is best not to anticipate too much, but everybody feels confident that a few months more will develop at the old Elk Horn one of the finest mining properties on the continent.

BOYLE MOUNTAIN.—Wood River *Times*, Aug. 9. Andrew J. Dunn, the well-known old prospector, has just returned from a trip up Warm Springs creek as far as Boyle mountain, and about 12½ miles west of Ketchum. He reports at least two bonanzas in sight on Boyle mountain, and a third being shown up. The largest of these was opened by Milt. Mourning. Mr. Mourning has exposed a chimney of ore 43 feet long and from 5 inches to 6 feet in width, with more ahead of the breast or face of the drift. This ore carries from 54.40 to 84.70 ounces silver per ton, and an average of 72 per cent lead. About three-fourths of a mile above, a Mr. Flannagan has leased the Niagara mine, and has already exposed a width of four feet of solid galena. He is now prospecting his find to ascertain its extent. In the same vicinity Jerome Jacobs and a partner are working the Ten-Broeck mine on a two-years' lease. The showing is very encouraging, and Mr. Dunn says that there is every prospect of the leasers making some money out of it.

AT THE RED CLOUD.—Wood River *Times*, Aug. 10: The owners of the Red Cloud mine propose to lose no time in getting to work again. Although the ground is hardly cool after the fire of last Saturday and Monday, they have already got lumber and shingles on the ground to rebuild the boarding-house and blacksmith shop. As soon as completed 10 men will be put to work knocking down ore, and as soon as these open up the stopes additional men will be put on, so that probably 25 will be at work by the end of September. It is the intention of the owners to extract from $15,000 to $25,000 worth of ore before snow flies, when they will put in their winter supplies and reduce their force to the winter complement.

BEAVER DISTRICT.—Wardner *News*, Aug. 3: Henry Lamb and H. Drought are owners of a location known as the Father lode made on June 3d on the divide between Nine Mile and Beaver creek and one-half mile south of Sunset peak. The first indication made visible to the prospector was a piece of float weighing fully 700 pounds of carbonate ore. On this discovery the work of sinking was begun and ore found to a depth of 12 feet. The vein now shows a width of two feet of good ore, and work will be continued until full development of the claim is made. The first assay made of the ore by J. Johnson shows 15 ounces silver and 70 per cent lead; the second, 24 ounces silver and 82 per cent lead.

LALANDE DISTRICT.—The work of enlarging the Poorman concentrator was commenced this week. It will be hurried to completion as rapidly as possible, and when finished will give the mill a daily capacity of 200 tons.

GEM.—Mr. Finch, superintendent of the Gem mine and mill, says their concentrator will be ready to run about the 10th instant.

SEVEN DEVILS COUNTRY.—Idaho *Avalanche*, Aug. 10: The mines of the Seven Devils country have been shut down. This is quite a surprise to all, as these mines gave promise at first to take the lead in Idaho. The probable cause of closing them is the expense of hauling from the mines to the nearest railway station. But if a railroad were built there enough ore could be taken out at such a decreased expense that it would pay the owners very well.

LOWER CALIFORNIA.

RICH AVERAGES.—*Lower Californian*, Aug. 8: Some of the mill tests of ore from the various mines at Alamo bear out the enthusiastic assertions of even old forty-niners that it is one of the richest districts on the coast, and with the most promising future of any. Six sacks of ore sent to San Francisco, taken from three Alamo mines and carefully sampled, and crushed and worked by mill process, yielded $109.49 in gold and silver per ton. The silver was $1.15—only a trace. Another six sacks were taken from all the mines of any note in camp and the yield as reported by the same mill process was $79.50 per ton. The ore from one mine, worked in an arastra, gave from $115.16 to $160.20 per ton. In another it yielded $89.90 per ton in gold, with not a trace of silver. There is no one who believes that the general average of this ore will give such results, but the run of $43 in the Torres mill shows that the average will be pretty high, for there are 20 mines in the district that will yield the same grade of ore.

JUAREZ MINING CAMP.—Good news comes from the old mining district of Juarez, about 95 miles northeast of this place and 30 miles south of the boundary line. The district having been previously abandoned, was granted about a year ago to Col. Castro de Beraza, who at the same time obtained a concession to a block of valuable mineral ground in the Valladares region. Col. de Baraza was at the East for some months, during which time he organized a company for the exploration and working of his concessions. He returned two or three months ago, accompanied by a corps of surveyors, with outfits, to survey the ground in order to obtain legal possession. Some 60 men were put to work in the placers at Juarez, and through new discoveries the concession is likely to prove of great value. It is reported that the placers are already yielding a handsome profit above wages.

ALAMO. — *Lower Californian*, Aug. 8: A rich strike has been made on the Anna mine, situated on the east side of Tomasa mountain, by Mr. Owens, of the El Paso Mining Co. The Anna is one the El Paso folks bought of Capt. Frazier. The ore is in a decomposed quartz which is full of gold. Capt. Owens says it is the richest of any of the famous finds of the Texas, El Paso or Avalina. The discovery was made Friday. Alamo is now in a fair way to get what she has most needed—mills and machinery. We have now two mills and five more are coming. Those coming comprise C. C. Lane's mill, part of which is already here; a new 10-stamp mill belonging to a Mr. Post of New York; the International Co.'s mill; the El Paso Co.'s 10-stamp mill, and the 10-stamp mill of Col. S. H. Lucas. Besides these, five additional stamps are being made for the Torres mill.

SANTA CLARA BASIN is coming to the front. For awhile it was despised and rejected of men, but the discovery of rich leads has turned a stream of prospectors in that direction. Some of the first discoveries were made in the basin as early as the first of March, among them being the Centipede, Summit, Cholla, Maud S., Castor and Minerva. The operations of the Santa Clara M. Ass'n and the Liberty M. Co. have been confined to the basin. Now reports of new discoveries are coming in, from even as far as 12 miles north of Alamo, on the trail into Santa Clara valley, where Beteta & Co. have denounced the Matilda.

NEW MEXICO.

BLACK HAWK.—Silver City *Enterprise*, Aug. 10: Tom Altwood and Dan McMullen are leasing on the Atlantic, at Black Hawk, and are meeting with encouraging results. Ben Hopson is working six men on his mine at Black Hawk, and is taking out some excellent ore. He will soon make another shipment of high-grade ore. James Demorest has purchased Mr. Taylor's interest in a sub-lease on a certain part of the Old Man mine for $500. Abner Enoch, who is leasing on the Old Man, was in town this week with some specimens from the mine worth $1 per pound. He has a good-sized pocket of this class of ore. The *Enterprise* has been informed by Judge Henderson and Benjamin Harrison, superintendent of the Pacific, that the new strike is on the Pacific ground and not on an extension, as this paper stated last week. The width of the vein in the new strike is nine feet, of which there is an ore streak of fully five feet of good pay ore which will average over $20 per ton. This is probably the largest strike yet made in this country.

MONTANA.

ACTIVE.—*Inter-Mountain*, Aug. 8: Quite a local revolution has occurred in copper mining during the past week, and once more the Chambers syndicate and other mines have renewed their old-time activity. Those that have not will in the very near future, according to reliable reports. The St. Lawrence has again resumed sinking, owing to the very recent developments in the drift connecting the St Lawrence and the Anaconda on the 800-foot level. Ore has been taken out richer in quality than ever before encountered in that mine. The Orphan Boy, a mine of the Anaconda company, has also commenced sinking from the 200-foot level, and will also sink 200 feet additional. The Chambers syndicate mines commenced operations yesterday morning. The Green Mountain put on three 8-hour shifts, sinking from their present depth of 300 feet, and will also sink 200 feet. The Modoc put on a number of miners some time back, sinking their main shaft. The High Ore blew its first whistle yesterday morning, and 20 men on a shift, for the first time in months, descended into the depths to bring forth its precious metals. The management of this mine has devolved on Joseph Laird. The reason of the so early resumption of the High Ore is on account of the St. Lawrence and others sinking, so as to be in readiness when the new smelter is completed.

THE CHAMPION MILL.—From Mr. Willard Bennett, one of the principal owners of the Champion mine in the Oro Fino district, it is learned that the company has decided on the erection of a mill immediately. The site has been chosen about one mile east of Deer Lodge, on a slope of the bench between Peterson creek and the Deer Lodge river. A contract has been let to the Utah & Montana Machinery Co. for a 20-stamp, chloridizing silver-mill, which is to be completed in November of this year. The Champion is now developed to the depth of 350 feet, with east and west levels at the 250 and 350. At the 250-foot level, the lead is from 2 to 14 feet in width, and a large quantity of ore has been shipped from it which has netted the company $1400 per car. At the 350 the lead is in no place narrower than 4 feet. Comparatively only a small quantity of ore has been shipped from the depth of 350 feet, but that sent has netted the company $2000 per carload. The shaft is a two-compartment one throughout, and the company has let a contract to Fraser & Chalmers for hoisting machinery of a capacity sufficient to sink the shaft to the 1200-foot level. All these improvements are to be put through without delay.

OREGON.

THE MONUMENTAL.—Bedrock *Democrat*, Aug. 8: This mine is in Granite district, Grant county, and almost west of Baker City, back of the high mountain peaks so prominently seen from this city. Last year the property was listed with Mr. T. Gilbert Bowick of London, who effected a sale, and a company, the Eastern Oregon G. M. Co. (limited) of London, England, incorporated with an authorized capital of $1,250,000. This company, composed as it is of wealthy men, have, since their coming into possession of the property, spent upward of $75,000 in development work and improvements on the same. Besides the many new improvements in the mill, the company has added an air-compressor which furnishes the power to operate the Rand drills in the tunnels and supplies pure air for the tunnels, also. The company is now engaged in running a tunnel, which, when completed, is expected to be 1200 feet in length, nearly 500 feet of which is already finished. Rand drills are used in the boring, and 120 feet per month is the headway being made. About 30 men, mostly miners, are employed by the company, and work on three other tunnels is being rapidly prosecuted, and the showing of ore is a fair indication that a large and rich ledge will yet be uncovered.

THE RED CLOUD is situated on Onion creek toward its head at an elevation of about 6000 feet, and is owned by Isaac Klopp and J. R. Bowick. Several tunnels have been run a distance of from 100 to 200 feet, not referring to the one on which all forces seem to be concentrated at the present time. This tunnel is now in about 600 feet and taps the ledge at a distance of 300 feet from the surface. From the entrance of the tunnel to its face a fine body of ore is uncovered nearly the entire distance. In the face of the tunnel a ledge fully two feet in width is found showing rich black sulphurets. From this tunnel to the surface is an upraise and a fine body of ore is here exposed. It is the intention of the owners of the Red Cloud to continue the long tunnel some distance farther and then to construct another to tap the ledge at still farther depth.

THE LA BELLEVUE.—After visiting the Red Cloud the reporter continued his journey and arrived at the famous La Bellevue mine owned by Messrs. John and Fred Cabble, situated on the highest point of one of the spurs of Bally mountain at an altitude of 8000 feet above the level of the sea. Starting at Tunnel No. 1, which is run a distance of about 400 feet on a continuous ore vein, we find a ledge in the face between four and five feet in width; then through Tunnel No. 2, a distance of 550 feet, which follows an immense body of ore the entire length; then through Tunnel No. 3, a distance of 840 feet, where the ledge is continuous, varying in width from five to twelve feet, and in the face of the tunnel, where ore is now being extracted, the ledge is five feet in width and the ore is of the richest black sulphurets, some of it going $1000 to the ton. Messrs. Cabble Bros. have a small mill in operation, consisting of a Dodge pulverizer, Golden Gate concentrator, etc., and are shipping their concentrates to Denver for reduction. Much of the ore taken from the mine is so rich that it is not worked in the mill but is shipped direct to Denver.

UTAH.

BEING DEVELOPED.—Park *Record*, Aug. 10: The Wasatch group, situated in Blue Ledge district east of the Ontario, is developing into a veritable bonanza. It is owned by S. P. Hoyt of Kamas, who a few months ago gave Messrs. E. C. Williamson, Jas. McCune and John Farish a seven-years' lease on this and other properties and also a bond for $100,000 on them. This Wasatch property of Hoyt's would never have amounted to anything by the old plan of operation, but as soon as the fortunate leasers obtained control of the property they immediately went to work to develop it properly. The vein in the old workings has been explored into new ground and connection made between the upper and lower tunnels. A fine vein is exposed between well-defined walls, the pay chute averaging two feet in width. Assays show the ore to be high-grade smelting, carrying over 80 ounces silver and about 50 per cent lead to the ton. A new road to facilitate ore shipments is being made, a large boarding-house is in course of erection and the working force will be increased from time to time. In a short while enough ore will have been taken out to commence and continue shipments on a large scale.

ORE AND BULLION SHIPMENTS.—The Ontario bullion shipment for the week was 33 bars, containing 18,434.39 fine ounces of silver. During the week the Mackintosh sampler received 569,720 pounds of Ontario ore; 383,600 of Daly; 114,750 of Mayflower No 7 leasers'; 58,250 of Woodside concentrates from the Union concentrator, and 42,500 pounds of Woodside first-class ore; total, 1,168,820 pounds.

THE COMSTOCK GETTING BETTER.—Since last week the six-foot ledge encountered in the Comstock has continued to widen and it is more than holding its own as to the character of the pay streak, which averages two or three feet in width.

ABOUT THE ALLIANCE.—Everything is in shipshape at the Alliance for making even faster progress in driving the 4800-foot drain tunnel.

MECHANICAL PROGRESS.

Foundry Literature's Present Need.

Practical literature upon the workings of any trade can inaugurate more progress in one year than could be accomplished in 50 years or more without it. Show me a trade "well written up" and its literature recognized and studied, and I will show you a body of tradesmen well entitled to be called mechanics.

That molding was, four or five years back, about the same as it was 50 years or more ago, was a very noticeable fact. Many looked upon molding as a trade not susceptible of improvement, and one governed more by luck than judgment. It is safe to say that the above unhappy state of affairs is at the present day being greatly remedied, and that the improvement can be largely credited to literature which has for the past five years appeared upon molding.

While the past few years have witnessed a great improvement in many molders, the few years to come will witness a still greater advancement. Molding is now being studied as a trade beset with difficulties, and which can be largely overcome by intelligence, and much that was allowed to be controlled by chance is now governed by knowledge, which makes desired results positive.

It is not the purpose of this article to state the points molders are, as a rule, deficient in; that is well enough seen or proved by the past or present uncertainty attached to the procuring of good castings; suffice it to say that this is every day being more and more overcome, and that the molder who is not capable of progress will soon find himself behind in the race.

The past few years have well proved the value of literature in advancing trade knowledge—especially so in foundry work. The kind of literature the writer has reference to is that written by men who work at the trade they write upon, and not that kind from which literature upon several different trades has usually emanated. A well-known publisher is reported as saying a few years ago that "mechanical literature would not sell." At the time the expression was used such was, no doubt, the case, from the fact that there was then little or no literature which would benefit a tradesman. Mechanics are not fools; give them literature written by men of personal experience and they are not slow to appreciate it. One trouble which now exists, and has in a great many cases to be overcome, with reference to getting molders to read trade literature, is to convince them that it will be valuable to them. I doubt if there is an intelligent molder living, and having the means, but what would subscribe for all the practical literature he could find bearing upon his trade, if some one would only get him once interested and give him a taste of what benefit he could derive from the same.

That there is a large field at present for missionary work in getting molders interested in foundry literature cannot but be evident to all who are so placed as to know how ignorant the general run of molders are upon the elements which govern the successful work in their line. The need at present is not so much the call for more practical writers as it is that those who do write shall be read more. Therefore, if you have anything containing foundry literature which you know would interest and instruct a brother molder, let him see it or know about it, and you will do much good toward removing the present bar to progress in foundry literature and in the elevation of the molder and his trade. —*Thomas D. West in American Machinist.*

IMPROVED PILE-DRIVING DEVICE.—It would appear that, in the matter of pile-driving by machinery, the apparatus employed in England at the present time is a decided improvement on the device which has so long been in use in this country for that purpose. Raising a hammer and having its weight drive the pile into the earth as the hammer falls, notwithstanding its accomplishment of the work, involves an amount of time out of all proportion to what should be required for such a result. In the improved device the driver is made in the form of a heavy steam cylinder, the lower end of which forms a hammer-head and acts upon the pile. The piston-rod is extended sufficiently to form an eye, a rope being attached to this, and by means of which the whole device may be raised and lowered by a hoisting engine in the customary manner. In driving the pile, steam is admitted to the cylinder, which is raised to a hight only limited by its length, and the simple operation of opening a large exhaust valve causes the cylinder to fall upon the pile and drive it a certain distance. The effective blows thus given can be repeated very rapidly.

A NEW AND VALUABLE IRON PRODUCT.—The want of a material intermediate in strength between steel and cold-blast iron has long been felt by customers, says the *Tradesman*. It occurs in cases of hydraulic cylinders, mill gearing, trammer blocks, etc., that the best iron fails to make articles of sufficient strength without increasing the dimensions to an unreasonable extent. On the other hand, the high price of steel castings and their liability to contain blow-holes offer serious objections to their adoption in such cases. A consideration of these facts led Williams, Arnold & Colley, Spanish Steel Works, Sheffield, Eng., to try and produce a metal which, though not quite equal to steel in strength, would, nevertheless, be far stronger than the best cold-blast irons made in this country, and also be capable of producing an absolutely sound casting. After some years of experimenting, they have succeeded in making a material which they call "steel pig," possessing some very remarkable properties. As regards mechanical strength, a bar 2x1 inches, bearings three feet apart, sustains a weight of about two tons. The strain supported by the "gray steel," when in tension, is upward of 15 tons per square inch, that of the best cold-blast iron being 11 tons. Castings made from the new material are soft, tough and quite free from blow-holes, and can be made from the raw pigs in any cupola with a good blast pressure. The purity of the metal, as regards phosphorus and sulphur, together with its comparatively low carbon and silicon, to a great extent accounts for its remarkable strength. The process adopted to produce these results is to purify the best hematite iron obtainable by removing nearly half the carbon and almost two-thirds the silicon, thus leaving in the finished product only sufficient quantity of these metalloids to render metal gray when cast.

RAILWAY WINDOW CATCHES.—Some of the highest developments of mechanical ingenuity are to be found in connection with details of railway construction and equipment, but it must be confessed that some things show a woeful lack of common sense. The catches which hold modern car windows, and the handles by which they are supposed to be lifted, are examples in point. The handle is generally a small recess or projection, only deep enough to receive the tips of the fingers of one hand, while the catch is on the right-hand side of the window, out of reach of the handle, and requiring the entire use of the right hand to release it, while the left hand is struggling to raise the sash. As the window generally sticks throughout the season when it is required to be frequently moved, this senseless arrangement is the cause of much irritation, profanity and broken finger-nails. There is no good reason why the windows should not be made to work freely, and in any case the handles should be so arranged as to permit a man to exercise some moderate portion of his strength upon them, and not have to struggle in the vain effort to lift a sticking window-sash with the extreme tips of the fingers of his left hand, while the right is occupied in holding a small catch out of gear. There are numerous ways in which this detail of car-fitting might be made reasonably serviceable, and it is to be hoped that some day the engineering ability of our railroad companies may be induced to solve the problem. *Mechanics.*

ANOTHER REVOLUTIONARY LOCOMOTIVE has been devised. It is to have two boilers, one above the other, and engine and tender are to be incased in a shell of thin iron tapering off to a point in front, the whole machine being 75 feet long and weighing in working order 91½ tons. Thus it will be 22 feet longer and 12 tons heavier than the largest European locomotive yet turned out. It is to have two pairs of cylinders 15¾x19½ inches, and four coupled driving wheels 9 feet 9½ inches in diameter, or more than twice the size of our large passenger-engine drivers. Great power and great speed are both claimed for this novel combination of parts and proportions, the ordinary gait being modestly placed at 75 miles an hour, but this being capable of increase to 92 miles per hour.

AN IMPROVED ANVIL has been introduced by O'Brien & Carew, 59 Swett street, Boston, so constructed that the face, which is liable to wear out, is readily replaced, thus avoiding the expense of purchasing a new anvil, as the defaced or worn part can be taken out and dressed by a blacksmith in a short time, or a new die be put in at a comparatively trifling expense. The dies are solid forgings from the best cast-steel, and the face of the anvil is chilled ½ inch in depth to correspond with the hardness of the steel dies. The body of the anvil is two-thirds steel, one-third iron being referred to as necessary in its formation to toughen it.

NEW METHOD OF MAKING MALLEABLE IRON CASTINGS.—Mr. C. C. Townshend of Madras has taken out a new patent for the making of malleable iron castings. Wrought-iron scrap is melted down in crucibles with the addition of small quantities of phosphorus and silicon, and when cast gives a malleable material which is also capable of being chilled. The best mixture is: 22 pounds of scrap, 7 ounces of fine river sand, and 5 ounces of bone ash, with a small quantity of glass as flux.

FURNACE PRODUCT.—According to London *Iron*, Mr. Alexander Pourcel has succeeded at the new basic open-hearth steel works of Bell Brothers in producing from Middlesbrough pig carrying 1.7 per cent of silicon and as much phosphorus, steel with as low as 0.03 per cent of phosphorus. The lining of the furnace is chrome ore.

A HEAVY PATTERN CASTING.—In the machine hall of the Paris Exhibition is a casting weighing ten tons. This piece de founderie is not intended to serve any useful purpose, but merely intended to show what can be accomplished by pattern-makers, molder and founder. As regards intricacy of detail it has never been surpassed.

SCIENTIFIC PROGRESS.

Combustion.

The source and origin of fire has ever been a subject of much discussion and abstract speculation from the time of Plato and Zeno to Newton and Faraday. For the benefit of those readers who have not traced the history of this phenomenon, we will go back a few years in its past history, back to the time when Stahl stood in the full meridian of his glory dictating to the world the Stahlian doctrine of the phlogistic hypothesis.

According to Stahl, all combustible bodies contain a certain principle which he called phlogiston, to the presence of which he ascribed their combustibility. He supposed that when a body burns phlogiston escapes from it, and that when a body has lost its phlogiston it ceases to be combustible and is then a dephlogisticated or incombustible substance. The heat and light which accompany combustion were attributed to the rapidity with which phlogiston is evolved during the process.

The discovery of oxygen, made by Priestly in 1774, proved fatal to the Stahlian doctrine. Lavoisier had the honor of overthrowing it and of substituting in its place the antiphlogistic theory, namely, that combustion and oxidation in general consist in the combination of combustible matter with oxygen, which is a constituent part of atmospheric air. To account for the evolution of heat and light during combustion, Lavoisier had recourse to Black's theory of latent heat, *i. e.*, heat is always evolved when a substance, without change of form, passes from a rarer into a denser state, and also when a gas becomes a liquid or solid, or when a liquid solidifies, because a quantity of heat previously combined, or latent, within it is then set free. This is precisely what happened in some instances of combination; thus water is formed by the combination of two equivalents of hydrogen and one of oxygen (H_2O) in which case two gases give rise to a liquid; or in the oxidation of metals, oxygen is then condensed to a solid. But the evolution of heat and light is now known to depend upon peculiar modes of motion of portions of matter.

Thus abstract and hypothetical ideas and explanations have been ardently advocated by scientists, who rose in one generation, and like their philosophy, died in the next. But in reviewing the past we should become oblivious to its imperfections, for it is obvious that in the rise and fall of each, science made one slip toward truth and beauty. And so to-day, we look upon those bygone doctrines, as upon the metamorphosis of the ancients, as being something of the imperfect past.

It is commonly believed that causes underlie and influence all material phenomena. The final cause of phenomena we term force, accepting for the various kinds of phenomena a variety of forces. The strange phenomenon combustion is simply a physical manifestation of chemical alterations in the constitution of bodies. As heat and light are peculiar modes of motion, therefore, in the aggregation of simple substances to form compound bodies, or in the disaggregation of compounds into simple substances there occurs a change of position of the atoms of which matter is composed; this change of position or motion becomes manifest in the phenomena heat, light and electricity.

As all chemical compounds are formed according to the affinity of their component parts, it is evident that those substances which have the greatest affinity for each other will unite with the greatest rapidity; thus, the affinity existing between hydrogen and oxygen is so great that when a match is brought into contact with a mixture of two equivalents of hydrogen and one of oxygen, a violent detonation ensues, with the production of water. The heat evolved by the burning match overcomes to a certain extent their cohesive attraction, thus causing an increase in fluidity, which facilitates the combination of the part of the gases which are in favorable contact; the heat produced by the union of the atoms passes from one to the other, causing a flash resembling lightning to pass through the mixture, rendering the union to the eye instantaneous.

This explanation is also true when applied to account for the production of heat and light in the combination of other substances. When pulverulent antimony or arsenic is thrown into an atmosphere of dry chlorine gas, the combination is so energetic that each minute piece of the metals glimmers like little stars, and before the particles reach the bottom of the bottle they have been reduced to an oily fluid, which is the chloride of antimony or arsenic, as the case may be ($SbCl_5$) ($AsCl_3$).

When speaking of the air as being a supporter of combustion, it is only so to those substances for which its oxygen has chemical affinity; thus, the spermaceti or ordinary stearine candle burns in the air because by the aid of heat the gases (or properly some of their component parts) which they evolve have a strong affinity for the oxygen of the air, therefore the heat and light which they produce is caused by the disaggregation of those hydrocarbon compounds, and in the production of other gases and vapors which disperse themselves throughout the atmosphere.

Every chemical union which occurs in a gaseous medium, and is accompanied by the evolution of light, chemists designate combustion. But we observe some bodies, such as sulphur and phosphorus, yield a flame when burned in the air or other gas; such substances are converted into gases or vapors at the temperature of combustion. Carbon burns in the air without a flame, becomes incandescent because it is non-volatile. The carbon compounds, wood and bituminous coal, are indeed non-volatile, but burn with a flame, because under the influence of heat they develop combustible gases. Flame is, therefore, nothing more than a combustible gas heated to incandescence.

We have before shown that combustibility is only a relative phenomenon; for if hydrogen will burn in oxygen by chemical affinity, so conversely will oxygen burn in an atmosphere of hydrogen by the same attraction. Illuminating gas, which is a compound of methane, ethylene, and a slight quantity of acetylene, together with hydrogen and carbonous oxide, burns in the air; so, conversely, will air, or properly its oxygen, burn in an atmosphere of illuminating gas.

This may be demonstrated in a very conclusive manner at a very trifling cost.

Take an ordinary lamp chimney and fit to the lower end a cork perforated so as to admit three glass tubes; one, a gas tube, should have an orifice of about 1-16 of an inch in diameter, and the air tubes should have an orifice of about 1-16 of an inch, left open for communication with the air. The gas issuing from the gas tube is ignited and the chimney is then dropped over the not too large flame; it continues to burn quietly, as sufficient air enters through the air tubes to support its combustion. Upon increasing the supply of gas, the flame becomes larger, filling the globe with illuminating gas, while the air is crowded back because under less pressure. As there is an atmosphere of illuminating gas in the chimney, and the air which enters is not sufficient for its combustion, the gas flame is suddenly seen to leap from the gas tube and ignite the air which enters, and burns with a faint light accompanied by a strange hissing sound. The excess of illuminating gas escaping from the upper part of the globe may be ignited; we then have a gas flame above and two air flames within the globe. On lessening the flow of the gas the air comes in in a quantity sufficient for its combustion, which is ignited at the end of the gas tube, while the air flames are extinguished. In this manner we may repeat the return process of the flames at will.

The gas consumed by an ordinary gas jet is sufficient for the combustion of ten jets of air, producing a temperature of about 1700° Fahr. At a very small cost a lamp could be made with which to burn the oxygen of the air. Its high temperature could be utilized in many ways.—*Theodore Douglass in Modern Light and Heat.*

HOW MIND MAY RULE MATTER.—Much has been said and written of late in regard to hypnotism—the power which any one possessing this quality may exercise over another person who is susceptible to its influence, and especially in regard to hypnotic promptings to the commission of crimes. In this latter regard M. Liegeosis, professor of law at Nancy, has made a special study of hypnotic suggestion in the relation to civil and criminal law, and has published his results in a recent memoir, says the Chicago *Tribune*. He has made a large number of experiments to establish the possibility of suggesting crimes, which the subject of such suggestions may carry out while ignorant of the motive-power that guides their hands. The following was one of his experiments: Arming himself with a revolver, he took a subject at random from among the five or six somnambulists with him at M. Liebault's. To remove any possible idea of play, he loaded the revolver and fired one shot in the garden. Then he went into the house and showed to one of the subjects a card just pierced by the ball. "In less than a quarter of a minute," he said, "I suggested to Mme. G—— the idea of killing M. P. by a pistol shot. Absolutely unconscious and perfectly docile, Mme. G—— approached M. P. and fired the pistol. The commissary questioned her immediately. She confessed her crime with complete indifference; she killed M. P. because she did not like him. They could arrest her. She knew well what awaited her. She was asked if I had not suggested the idea of the murder she had just committed. She assured us that this was not so; that she was led to it spontaneously, and that she alone was to blame."

A STATISTICAL AUTOMATON has just been put on trial in the office of the Board of Health, New York. With the aid of an electric battery this automaton is expected to tabulate, with unprecedented rapidity and correctness, all the statistical information which it has heretofore required some 10 or 12 clerks to handle. The machine was devised originally for the purpose of tabulating returns of the eleventh census of the United States. It records, on small square cards, all sorts of statistical data concerning sex, age, race, marriage, death, disease, occupation and dwelling-place.

ELECTRICAL EXECUTIONS.—Mr. Edison, on being interviewed by the New York authorities in regard to the possibility of failures in electrical executions, gives it as his opinion that they are both sure and painless when properly performed. It appears that France is likely to follow the example of America in the manner of inflicting capital punishment, for a proposal is now advanced to abolish the guillotine and substitute death by electricity.

GOOD HEALTH.

A Lesson From the Late Slogging Match.

It is a matter of congratulation that amid the mass of evil connected with the late brutal slogging match at least one important question for good has been extracted therefrom by the *Occidental Medical Times* of Sacramento. This lesson is found in the training to which Sullivan was subjected in preparing him for the contest. This great animal-man, with a naturally magnificent physique, had been reduced by dissipation to a mere wreck of his former self. His flesh was flabby; his limbs weak and unsteady; his stomach was rejecting and unable to work up the lightest food, and he looked as if he could hardly live three months. Under these conditions "Dr. Muldoon," as Sullivan pleasantly speaks of him, took his man and really made him over—made a new man of him, as it were; and this is the way, according to the *Times*, in which it was done:

"After a few weeks of really scientific treatment, and without the aid of drugs, his stomach was restored, so that three chickens, half a loaf of bread, besides wine and other things, were taken at a meal. The household butcher's bill amounted to $100 a week. His muscles became as hard as iron; every morsel of superfluous fat was made to disappear. The force of his blow equaled half a ton; a spin of a dozen miles was regarded as a gentle exercise; his volitional nervous power was apparently inexhaustible, and he has proved himself to be, without the possibility of question, the very paragon of strength, activity and endurance, the realization of perfect physical health."

Well may it be said: "After a few weeks of really scientific treatment," for what could be more scientific than a treatment which could take such a physical wreck and produce such wonderful results? Why would it not be well for some medical college to create a Chair of "Physical Training" and make "Dr." Muldoon or some better man the professor?

This, says a cotemporary, has been a splendid demonstration of what pure physical training, with a carefully selected diet, will do for the human animal. It is said that "Dr." Muldoon is already overwhelmed with applications from men of means who offer him large fees to train off their superfluous fat, relieve them from dyspepsia and other kindred ailments. Every health resort should have a department for physical training and some one well qualified to superintend it.

Statistics of Breathing.

In each respiration an adult inhales one pint of air.

A man respires 16 to 20 times a minute, or 20,000 times a day; a child, 25 to 35 times a minute.

While standing, the adult respiration is 22; while lying, 13.

The superficial surface of the lungs, *i. e.*, of their alveolar spaces, is 200 square yards.

The amount of air inspired in 24 hours is 10,000 litres (about 10,000 quarts).

The amount of oxygen absorbed in 24 hours is 500 litres (744 grammes); and the amount of carbonic-acid gas expired in the same time, 400 litres (911.5 grammes).

Two-thirds of the oxygen absorbed in 24 hours is absorbed during the night hours from 6 P. M. to 6 A. M.

Three-fifths of the total carbonic acid is thrown off in the day-time.

The pulmonary surface gives off 150 grammes of water daily in the state of vapor.

An adult must have at least 360 liters of air an hour.

The heart sends through the lungs 800 litres of blood hourly, and 20,000 litres, or 5000 gallons, daily. The duration of inspiration is five-twelfths, of expiration seven-twelfths, of the whole respiratory act; but during sleep inspiration occupies ten-twelfths of the respiratory period.—*Ex.*

POISONS AS STIMULANTS.—Every virulent poison known to botany or chemistry, says Dr. Felix L. Oswald, can be used for purposes of stimulation. The Yakoots of Northern Siberia fuddle with poisonous toadstools, the Syrian mountaineers with arsenic, the miners of the Peruvian Andes with verdigris, the Chinese and Turks with opium, the Syrians with a decoction of hempseed, the Malays with the acrid juice of the betel nut. In a few starving villages of Dalmatia, foxglove leaves (digitalis) are used for intoxication purpose. The great preference for alcohol for centuries—and even since the first dawn of historic tradition—may be explained by the fact that it is by far the most universally accessible of the virulent stimulants, rather than by any attractiveness of its taste, or by hereditary desires. Even the drunkard's children, contrary to common belief, are nauseated by the first taste of fermented or distilled liquors.—*New York Telegram.*

THE NERVOUS PATIENT.—In the old days the nervous patient was one who met with but little forbearance from others. It was universally conceded to be a matter of the patient's own will; she could be different if she would, and only the more charitable called her possessed. But nowadays it is commonly admitted that the nervous patient is irresponsible, that scolding and reproaching are worse than useless, inasmuch as they are cruel and wicked, and that the only cure for the trouble is complete indulgence and rest, for it has at last been recognized as a trouble, a real trouble, and not a voluntary matter within the patient's control—a case not of fidgets, but of tired and sick and naked nerves that must be soothed and cushioned and clothed and made whole again.—*Harper's Bazar.*

CAUSES BALDNESS.—One great cause of baldness is the habit some people have of changing the style of hair-cutting half a dozen times a year, or nearly as often. They insist on the "short pompadour" in the hottest months, a less pronounced crop in the fall, and then wear their hair longer as the weather gets colder, gradually approaching a shave again by the time the thermometer gets up in the nineties. Now all this may be very comfortable, but it is very bad for the hair and scalp. It is best to wear the hair short all the year round, brush it freely and trust to nature for the only really effective substitute for pomade.—*Barber in Globe-Democrat.*

SACCHARINE AS AN ANTISEPTIC.—We lately referred to the importance of having antiseptic mouth washes and tooth powders in general use. Apropos, we see it announced by a French writer quoted in the London *Lancet*, that six per cent of saccharine dissolved in water is perfectly effective for the mouth and teeth. The next thing is the tooth syringe for searching crevices. A strength of only one in 500 is said to prevent the formation of low organisms—*i. e.*, spoiling—in mucilage, etc.

NEURALGIA OF THE HEART.—What do our homeopathic friends say to this? Dr. Richardson, of London, received a prize of 25,000 francs from the Academy of Medicine in Paris for having discovered an almost infallible remedy for angina pectoris by the administration in small doses of 1 100 to 1-25 of a grain of nitro-glycerine! I know a number of persons who always carry tablets of nitro-glycerine with them.—*Belford's Magazine.*

IS IT SO?—If one side of the nose be closed, as by pressing with the finger, the lungs will not expand equally. It is a curious fact and shows the intimate relation existing between the nostrils and the lungs. The importance of unobstructed nasal passages is also apparent.—*People's Health Journal.*

POISONOUS MACKEREL.—A case of poisoning from eating a mackerel has led to the statement from excellent authority that "the gills of a mackerel undergo fermentation, and that no part of the head or near the head should be eaten after 48 hours of the fish being caught."

USEFUL INFORMATION.

AN ELECTRIC WIRE FENCE.—Speaking of the completion of 30 miles of electric wire fence around the L. X. ranch, the Amarillo *Northwest* says: The current was recently turned on for the entire line, and since then, and from this on, she hums on in wonderful shape and stands a system of practical fencing neither surpassed nor equaled by any other. It is simply one of the wonders of science and is a monument to its inventor. A party had a demonstration of its effectiveness. On one side of the fence stood some dozen or fifteen steers; on the other stood one alone. He undertook to break through and go over to the majority. When he struck that smooth wire fence, he jumped like he was hit at once with forty million hornets, and with his tail coiled over his back he wheeled and only struck the ground in high places. Then the fifteen made a dash to join him. One by one they rubbed that electric fence, and as fast as they did they jumped, kicked and wheeled as though they had urgent business at the North Pole and had only a few hours in which to make it. That electric fence is a stunner. Not one of these cattle was hurt, but not one of them will go near the fence again.

NEW COMPOSITION FOR SOFTENING LEATHER. Dr. Alexander Zoroastroff of Bolostok emphatically recommends to people working about water a grease for boots which is said to completely prevent sore feet, and so protects pedestrians from the whole train of familiar affections caused by that minor accident. The ointment is made of four parts of lard, four parts of olive oil, and one part of caoutchouc (raw rubber), melted together on a slow fire. Having moistened the sole of the boot with water, the inventor warms the boot in a stove or before a fire, and then smears it over with the compound. The boot is said to become soft, pliable, shining, waterproof, and even more durable.

USE OF WATER GAS IN THE MANUFACTURE OF LIME.—The use of water gas in the manufacture of lime is likely to revolutionize the industry in the State of Maine. Limekilns at Rockport are run on this plan and the process is quite interesting. Coal is placed in the bottom of the kiln, in the same manner as in former use of wood, and lighted. A spray of water over the burning mass becomes decomposed, the oxygen entering into the combustion of the coal and its products, while the hydrogen or "water gas" passes into the heated limestone, in the barrel of the kiln, where it is consumed with intense heat, the result being that lime is formed much more rapidly and economically than by the old process and those of wood fuel. An air blast is furnished from a blower driven by a water motor or horse-power. The system is being rapidly introduced, the patentee having manufactured since August, 1888, over 37,000 casks of lime by the new process, at a saving of over six per cent. By the use of "culm" coal a further large gain can be made.—*American Engineer.*

CHINESE PAPER MONEY.—The Chinese made, printed and issued paper money—"greenbacks"—more than 2000 years before the Christian Era. Their earliest issues of this character were known as "flying money," or "convenient money," first issued in China 2697 B. C. Originally these notes were issued by the treasury, but experience dictated a change to the banks under Government inspection and control. The early Chinese "greenbacks" were in all essentials similar to the modern banknotes, bearing the name of the bank, date of issue, the number of the note, the signature of the official issuing it, indications of its value in figures, in words and in the pictorial representation in coins or heaps of coins equal in amount to its face value, and a notice of the pains and penalties following counterfeiting. Over and above all was a laconic exhortation of industry and thrift: "Produce all you can; spend with economy." The notes were printed in blue ink on paper made from the fiber of the mulberry tree. One issue, in 1399 B. C., is all carefully preserved in the Asiatic Museum at St. Petersburg.

A QUEER MINE OF VALUABLE WOOD.—Forty miles above New Orleans is the old bed of the Bonnet Carre Crevasse, says the *Times-Democrat*. Fifteen years ago the Father of Waters burst his bonds and swept through there to Lake Pontchartrain. Five years ago the State of Louisiana, with the assistance of the Mississippi Valley railroad, rebuilt the Bonnet Carre levee, but it could not restore altogether the conditions prevailing antecedent to the crevasse. The river in the ten years it passed through the swamp, piled up its sands against the big cypress forests there. It has left behind a buried forest. The piled-up sand has deadened nearly all the trees, and a shingle-mill is now at work there manufacturing them into shingles with all the rapidity with which that machine works. Wood is obtained in a similar manner on the Atlantic Coast of New Jersey.

ROTARY BAG MACHINE.—The combination American clock-bottomed bag machine will make 120 bags a minute. It works from thin or thick paper, and can be adjusted to make different sizes. The machine is simple in construction, and requires very little power to run it. The pasting and folding are completed automatically. There are but few working parts, all of which are of rotary motions. After the bags leave the machine they pass over a drying cylinder of six feet diameter, which can be heated either by steam or gas, and then the bags are picked up in the space between the machine and cylinder by girls. The bags are carried over the cylinder by means of a felt. The paper is obtained from the mills in rolls of the required width.

WILL RATS GNAW HEMLOCK?—A cotemporary says: "We have heard it said recently that a rat will not gnaw a hemlock board, and that a grain-bin in a stable, if made of hemlock, or lined with it, is as safe against rats as if it were lined with galvanized iron. Whether this is so we cannot say, but some one ought to know about the matter, and if that person will come forward with his information he will deserve the thanks of the building community."

BLANKETS IN HOT WEATHER.—Travelers on the hot plains of Siberia keep cool by wrapping themselves in thick blankets. When the temperature there reaches 118 and 120 and over, travelers, it is said, wrap themselves in two heavy blankets and cover their limbs with thick pillows on the side next to the sun to prevent the blistering of the body and from becoming sick and nauseated at the pit of the stomach.

A NEW CEMENT.—A stone has been discovered in Japan which has remarkable qualities as a cement material, and can be worked up for a much less price than the imported article costs. The cement will bear a weight of 400 to 500 pounds per square inch.

LIVE CATTLE FOR EUROPE.—All the outgoing steamers from New York and Boston for the next three months are secured to convey live cattle to Europe. Although export rates are high, the trade is yielding a good profit.

LONG RANGE GUNS.—Ten and three-quarters miles is the range that the French have obtained for the 43-ton gun, 35 feet long, with an 800-weight projectile and 425 pounds of powder.

THE Union Pacific road offers $2000 cash to any passenger on any train that will shoot a train robber, and several parties are making frequent trips in hopes to get a shot.

THE first grindstone ever seen in Madagascar was left by an American vessel a year ago, and the Queen rewards heroes by allowing them to turn it while she sharpens her ax.

ELECTRICITY.

Three Miles a Minute.

The Baltimore *Sun* gives a description of a remarkable invention which will be known as the Weems Railway System, and which, if it proves successful, is destined to revolutionize the method of carrying letters and light freight between the principal cities. A company has been formed and incorporated in Baltimore, with an abundance of capital, which has secured 143 patents to cover all its various devices, and which proposes to operate an electro-automatic transit device for the rapid transmission of letters, newspapers and small parcels. The device consists of an electric-motor car and any desired number of other cars to form a train.

The motor car is 18 feet long and 2½ feet square at each end. It is pointed in front, the wedge or point being below the longitudinal center, adjusting it to the air pressure, thus keeping the car down to the track. To reduce atmospheric friction to a minimum, all wheels and electrical appliances are placed within the walls of the cars. The road is to be built with a track of 24 inches gauge, and will cost about $5000 per mile. It may be constructed either above or on the ground. It can be built with greatly varying grades and curves. The entire train will be built in telescope form, so as to leave no projections or uneven surfaces to impede swift passage through the air. The rear end of the rear car is pointed in a similar manner to the front of the motor car, thus preventing any suction as the train rushes on its way. The motor may pull one car or a train of cars.

All trains will be controlled from a generating station, where will be placed an electrical generating plant. Electrical brakes are to be used, and trains are started, stopped, speed lessened and backed at will from the station. Special electrical appliances will inform the operator in charge of the generating station of the exact location of the train from the time it leaves or passes any given point until it reaches its destination. It has not yet been determined how far apart the generating stations shall be placed. Possibly 100 miles may not be out of range, as the current can be run for 50 miles each way from the station as a center without much loss of electricity.

A series of experiments have been made at Laurel, Md., to show what the Weems railway system will do. This experimental line is a circuit of exactly two miles. Over this route there are 29 changes of grade, some of them very heavy, even to the extent of 108 feet to the mile. The generating plant there contains all the electrical appliances necessary to the attainment of high speed by a railroad train. There is also special machinery for experimentation, and the perfecting of all mechanical and electrical inventions, tending to advance and improve the system. All tests of speed have been made upon heavy grades and curves combined, too great ever to be required in the construction of a commercial line, therefore the experiments demonstrate the high rate of speed which may be obtained upon lines built for business purposes. At this experiment station two miles per minute are made around a heavy curve, or the equivalent of 180 miles an hour, or three miles a minute, on a level track. Prior to the inauguration of this system, 20 miles per hour was the fastest time ever made by any kind of electrical railroad travel.

The cigar-shaped car, painted a bright red and moving sharp end foremost, at first sight does not seem a wonderful thing as it goes quietly along the track, but later, when the engineer at the dynamo puts on more power, or as a steam-car man would say, more steam, and the creeping thing hastens its movement until it fairly flies and becomes a moving streak of red, spectators feel the progress being made in applied science and talk of the wonders of electricity and the great things it will accomplish in the active affairs of life in the near future. All who have witnessed the successful trials at Laurel are impressed with the great stride made in the matter of rapid transit by electricity. Edison, who has been a witness to the experiments, pronounces it the greatest electrical conception since the telegraph. Wherever it passes along the surface of the ground, the road will be fenced in with barbed wire to keep off cattle, and, being insulated, the wires will be used for telephoning and signaling along the line. It will soon be able to handle perishable freight in comparatively large quantities. The mails may be carried from New York to San Francisco in 24 hours, with plenty of time for necessary turnouts and other delays.

The advantages of this system are not alone in its speed, but in the economy and frequency with which trains can be dispatched. In addition to all these things, it will save interest on remittances at long distances, will bring the people closer together, and will create new enterprises. Its developments will create new fields of usefulness not now thought of. Such, in brief, are what the persons interested in this invention claim for it.

Arrangements are already being made for the building of an extended road between distant cities, and Baltimore will be one of the stopping-points on the line.

A NOVELTY in the application of electricity to musical instruments has lately appeared in Germany, by which a movement of electro-magnets changes the timbre of the tone.

SAN FRANCISCO:

Saturday, August 17, 1889.

TABLE OF CONTENTS.

ILLUSTRATIONS—Wells' Hoop-Clamp for Tanks; Smyth's Shaking Table Used at End of Mill Sluice; Pelton Water Motor for Small Work, 121. American Ipecac, 123. Section of Artesian Boring in Shasta Valley Basin, 129.

EDITORIALS.—Hoop-Clamp for Large Tanks, 121. Passing Events; The International Geodetic Association; Milling Gold Ore; Roll and Jig vs. Battery and Vanner; Small Pelton Water Motors, 128 Classification of Imported Ores; Occurrence of Nickel. 129. Assaying Notes; Local Jealousies, 130

CORRESPONDENCE.—Plumas County Mines, 122.

MISCELLANEOUS.—Storage of Water, 122. The Northern Counties of California, No. 9; American Ipecac, 123.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 124-5.

MECHANICAL PROGRESS.—Foundry Literature's Present Need; Improved Pile-Driving Device; A New and Valuable Iron Product; Railway Window-Catches; New Method of Making Malleable Iron Castings; Furnace Product; A Heavy Pattern Casting, 126.

SCIENTIFIC PROGRESS.—Combustion; How Mind May Rule Matter; Electrical Executions, 126.

GOOD HEALTH.—A Lesson from the Late Slogging Match; Statistics of Breathing; Poisons as Stimulants; The Nervous Patient; Causes Baldness; Saccharine as an Antiseptic; Neuralgia of the Heart; Poisonous Mackerel, 127.

USEFUL INFORMATION.—An Electric Wire Fence; New Composition for Softening Leather; Use of Water Gas in the Manufacture of Lime; Chinese Paper Money; A Queer Mine of Valuable Wood; Rotary Bag Machine; Will Rats Gnaw Hemlock; Blankets in Hot Weather; A New Cement; Live Cattle for Europe, 127.

ELECTRICITY.—Three Miles a Minute, 127.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 136.

Business Announcements.

Meeting Notice—Gover Mining Co.
Rebellious Mine Wanted—Refractory, Box 2517.

See Advertising Columns.

Passing Events.

The mining associations of Utah and Colorado are passing resolutions asking that the importation of lead ores be stopped, and the Southwestern Mining Association, at El Paso, "resolve" just the opposite. The latter say they want fluxing ores to mix with the dry and refractory ores of Texas, New Mexico and Arizona, and that their smelting interests will be destroyed if the Mexican ore is kept out or made to pay duty.

The powder manufacturing companies of this State have made an agreement which advances prices in their products.

They are having a water famine in Montana, and a number of mills have closed down in consequence. The loss on herds will be great also. The whole world seems to have a surplus of water except up and down the region between the Rocky and Sierra Nevada mountains.

Connecticut capital has organized the Nevada Copper Co. to mine the copper at Luning and commenced work.

Every one is discussing the shooting of the notorious David S. Terry by a deputy U. S. Marshal who had been detailed to protect Judge Field from anticipated assault. Terry struck Field in the face in the eating-house at Lathrop, and was immediately shot dead by the marshal. As has often been predicted, David S. Terry died with his boots on. Thus another event worthy in its sensational features of the old California days has been consummated. Such things are no credit to the age.

The International Geodetic Association.

By an Act of the last Congress, the United States became a supporter of the International Geodetic Association by appropriating the sum of $450, which will be repeated annually for the next nine years. This membership entitles the Government to one delegate to attend the meetings of the association in Europe, and one of the last acts of President Cleveland was to appoint Prof. Geo. Davidson of the U. S. Coast and Geodetic Survey as the representative for the country.

The Geodetic Association was organized many years since in order that the few eminent geodesists might interchange their views and experiences, and influence the different Governments of Europe to adopt the best modern methods and the finest instruments of precision in covering the older work of the European States with a larger and controlling network of triangulation and of telegraphic longitudes. Within a few years the association has reached a higher organization and is now maintained by subscriptions from each Government.

The commission meets in different cities of Europe, just as the American Association for the Advancement of Science meets in different cities of the United States.

This year the commission meets in Paris on the 2d of October at one of the departments of the Government. The members of the permanent commission will exhibit the fruit of their labors since the last meeting in the astronomical determinations of longitude, latitude and azimuth; in the levelings of precision through Europe and the results obtained from self-registering tide gauges, in determinations of gravity from pendulum experiments and local deflections of the plumb line occasioned by the proximity to mountain masses, or by denser masses below but near the surface of the earth. On these points the United States Coast and Geodetic Survey will be able to report a main triangulation nearly finished across the continent from the Pacific Coast to the Atlantic, on the parallel of 39 degrees, a network containing larger triangles than those of any other country, with sides reaching as much as 192 miles in length. In this triangulation special observations have been made by Prof. Davidson that have been pronounced "unique in the history of geodesy."

The work of telegraphic differences of longitude has been carried on with all the refinements of the best methods and instruments and with the experience of the best observers. In the recent determination of the longitude of the telegraphic longitude station near Verdi (for the establishment of the 120th meridian) the result differs only two-thousandths of a second of time from that determined by Prof. Davidson in 1872. Work of this character cannot be surpassed.

In the measurement of base lines, the practice of the Coast and Geodetic Survey is broadly and largely different from that of Europe. Where the practice is to measure short bases in this country, and especially on this coast, the two principal base lines are each ten and four-fifths miles long; that in Yolo county was measured twice, and that in Los Angeles county, three times. From some preliminary calculations it is believed that the probable error on the Los Angeles base will be about a quarter of an inch, which means that there is a probable error of one foot in the measure of 2,700,000 feet.

From these long bases, there are few steps in developing the geometrical figures to the largest dimensions practicable through few triangles. This is a very important consideration, because the increase of error is largely found in the measures of the horizontal angles of the different triangles.

Prof. Davidson will probably make a communication to the commission upon the status of the work upon this coast, and its prospective extension in a series of great figures along the chains of the Coast and Sierra Nevada and Cascade mountains; upon the methods of work in the mountains; the economy of the Coast Survey organization; and the direct and practical value of the results to the States in their respective surveys, and to commerce and navigation in the execution of the topography and hydrography of the seaboard.

The publication of the charts of the Survey show that nothing can be superior to such as we have for San Francisco. The publication of the "Coast Pilots" for the benefit of the navigator is a feature not undertaken in the geodetic operations of Europe. To this may be added the study of the ocean currents and the fauna and flora of the Atlantic and Gulf of Mexico, as exemplified by Alexander Agassiz in his "Three Cruises of the Blake," a Coast Survey steamer.

With a practice of more than 44 years in the field, from Newfoundland to the Gulf of Mexico and from Panama to Alaska, we may expect that Professor Davidson will represent the progress, efficiency and usefulness of the U. S. Coast and Geodetic Survey. He has orders to leave for Washington on the 25th of the present month for conference with the superintendent, and he expects to visit the observatories of Greenwich, Paris and other cities. He will take with him some of Watkins' large photographs of the stations of the Survey in the high Sierras to illustrate some of the difficulties that have to be overcome by the triangulation parties. Unless detained in Washington on his return, he will be in San Francisco by November 1st.

Milling Gold Ore.

The Suffolk Gold Quartz Company operates the Smyth mine, in Angels district, Calaveras county. The ore is run over a tramway from the mine to the mill by use of a car and carman, and the expense of transportation is 20 cents per ton. The ore is free milling, with a very large percentage of sulphurets of various kinds, including copper pyrites. Considerable gangue on the footwall is gold-bearing and carries sulphurets. One character of ore seems to be a gold-bearing talc, another a mixture of diorite (greenstone) carrying free gold, and highly charged with sulphurets. The ore is sometimes amalgamated in the battery, and sometimes not, according to the nature of the rock. In either case the amalgamation is on outside electroplates and afterward in a shaking table of peculiar construction, and illustrated in the drawings on page 121, which are taken from the report of the State Mineralogist. Sometimes some of the ore is worked in a kind of arastra, but usually amalgamation is completed on the shaking table, which has a silvered plate on the discharge side, on which a spray of water strikes.

The mill contains five stamps, of 600 pounds each, which are given a drop of from four to six inches, 80 times per minute. The mill has a capacity of crushing 10 tons in 24 hours. The shoes and dies are white iron. Three hundred tons of ore wear out about 400 pounds of iron, representing a weight of 1⅓ pounds of iron to the ton of ore crushed. At 4½ cents per pound for iron the wear of shoes and dies is six cents per ton of ore crushed, the lightness of wear indicating a soft rock. The battery requires about one miner's inch of water. Nos. 9 and 10 angle-slot screens, 6x44 inches inside the frame, are set vertically. The discharge is four inches above the die, and increases to seven. The apron is 48x54 inches; the sluice 8 inches in width and 20 feet long, inclined 1½ inches to one foot, and silver plated.

Two plates are used inside of the battery, one on each side, 44 by 3 inches and 44 by 6 inches respectively. The Stanford self-feeder is used. When the ore is amalgamated in the battery, 60 per cent of the value recovered is saved inside, about 25 per cent on outside plates, and 15 per cent on shaking table, though for one month one-third of the gold was saved in each place. The percentage of sulphurets varies from one to ten, principally iron and copper pyrites associated with arsenic. They have a value of about $50 to $100 in gold and $1 50 silver by assay, and are saved in riffle sluices. They are worked at chlorination works, where 90 per cent of the assay value is allowed and $20 is charged for treatment. Cost of milling per ton: Labor, 55 cents; water, 20 cents; shoes and dies, 6 cents; incidentals, 29 cents; total, $1.10.

IT is reported that the 12,000 acres of land owned by the California Steel & Iron Company about Clipper Gap will soon be placed upon the market and sold off in small farms.

A Piece of Nature's Sculpturing.

In the outlines of a rock, a crag or a mountain, there are often seen resemblances to the human face or form, or the shape of some animal or familiar object "graven by art and man's device." Such instances of nature's sculpturing are the subject of an entertaining illustrated article by Dan De Quille in the August *Overland*, from which, by courtesy of the publishers, we borrow the accompanying picture, (see page 121,) and description of

The Stone Elephant of Inyo.

No one will ever be in doubt as to whether Nature intended it to represent an elephant, a buffalo, a rhinoceros, or a hippopotamus. In most cases it is necessary to take a particular stand at some distant point when viewing such freaks—distance lending illusion quite as readily as "enchantment;" but the elephant rock of Inyo is still an elephant, whether we are a mile away or stand directly by its side.

The stone elephant is situated four miles west of the village of Lone Pine, Inyo county, California, on the road to Mount Whitney. It stands at the mouth of a large dry canyon, amid low, broken, and rocky hills, destitute of all vegetation except sagebrush. It is about ten miles east of Mount Whitney, which is hidden by the mountain range seen in the distance.

The rock that has taken the elephantine form is a dark gray granite that is almost the color of the skin of an elephant. The stone elephant is about 25 feet in length by 15 feet in hight. Those who see it for the first time mistake it for a petrifaction, until they find on drawing near that it is composed of granite. The first discoverers thought, on catching sight of it, that they had found a petrified mastodon.

An old Piute Indian, on being asked about the freak, said: "Yash, me see him many year 'go. Long time Injun no sabe him; now see him all same in big show up Virginny City."

Small Pelton Water-Motors.

The well-known Pelton wheel is made in a variety of sizes, but it is only within a short time that a very small one has been manufactured. The Pelton Water-Wheel Company of this city now, however, makes a 12-inch motor, weighing 75 pounds, and costing $50; and a six-inch one, weighing 25 pounds, and costing $25. These prices include a stop valve, driving pulley, and three interchangeable tips of different sizes to give such variation of power as may be desired.

The little six-inch motor will give with the pressure from the San Francisco mains within a fraction of a horse-power, and more power with increased head. The cut on page 121 shows the form in which the motor is arranged ready for use. The bed plate is bolted down and the top casing put on, covering the wheel in; the whole is then ready for pipe connection. These small wheels are of the same general design as the large ones and are carefully made.

For small power this is a very convenient appliance. There are many places where a spring or small stream could be utilized (sufficient head being secured) to run various kinds of light machinery by day and a dynamo at night, furnishing light for the house and outbuildings at nominal cost.

In cities and towns where water can be had from street mains, the motors are found most useful in running printing presses, lathes, and a variety of other machinery. But a small amount of water is needed for a very considerable power with a good head or pressure. These small motors are destined to come largely into use, being very inexpensive and efficient.

HON. A. F. PARKER informs the Boise *Statesman* that the alleged discovery of new placer diggings beyond Warrens, in Idaho county, "is a barefaced fraud and an 18-carat bilk," and that the excitement was only gotten up in order to enable the promoters to sell whisky. The location of the alleged discovery was on Lost creek, a tributary of the middle fork of Salmon river, in the vicinage of Yellow Pine Basin.

"THE mining knowledge of the superintendent is often found in the head that fills the foreman's hat."

The coal mines at Timberline, M. T., are being operated by C. W. Hoffman under a lease.

Classification of Imported Ores.

The delay of the Treasury Department in ruling on the classification of imported ores is doing great injury to the lead-mining interests of this country. This industry is a very large one, and to protect it Congress levied a duty of 1½ cents per pound on lead ore. This provision of the law is nullified by a ruling of the Treasury Department under which such ores come in free of duty when their silver contents exceed their lead contents in value, and under this ruling some 50,000 tons of lead were imported free of duty in 1888. The ruling was resisted by the lead miners in that year, but without effect. In May last delegates from the lead-producing States and Territories were given a hearing before the Treasury Department, at which time all the facts were elicited, so that the Department is not in ignorance of the injury being done to the industry. Action is still delayed, however. Lead ores are being largely imported from Mexico and Canada, and a surplus of lead and lead ores is being accumulated, which will depress prices for a long time. American mines are closing down with great loss and thousands of American miners are being thrown out of work.

The Utah Ore-Producers' Association held a meeting the other day, made a statement of these facts and adopted the following resolutions:

Be it Resolved, That we urge upon the Treasury Department that if it intends to give relief to this great industry, such action should be taken at once as will assure protection against the ores mined by peon labor; and, further,

Be it Resolved, That we hereby appeal to the President of the United States and the Honorable Secretary of the Treasury to hasten such measures as will give to American mines and miners the protection accorded them by law, and we impress upon them the fact, that continued delay will be nearly as fatal to American mining as a ruling which would give free trade in ores with Mexico and British Columbia.

The great difficulty is on the Mexican border, where most of the ore comes in. It is well known, however, that several of the great smelting plants depend largely on this imported ore, and are thriving at the expense of the lead miners. The owners of these works evidently have more influence than the miners, or the custom would have been stopped long since. The longer they can put off a reversal of the ruling, the more ore will they get to work. The Idaho miners are suffering also from the importation of ores from British Columbia under the same ruling.

Comstock Ore and Bullion.

The mines on the Comstock produced during the last quarter $1,250,000 as against $1,300,000 the previous quarter. The following figures for the last quarter are taken from the sworn statements of superintendents, now on file in the assessor's office:

Con. Cal. and Virginia produced 36,286 tons of ore yielding a total of $725,529.03 in bullion; average yield per ton, $20; actual cost of extraction, transportation and reduction, $497,202.32; net yield above cost of production and subject to bullion tax, $228,326.71; total bullion tax on net proceeds, $6849.80.

Confidence produced 1602 tons of ore yielding bullion valued at $27,111.89; yield per ton, $17; actual cost of extraction, reduction and transportation, $35,526.47; cost of production above yield, $8414.58.

Yellow Jacket produced 8434 tons of ore yielding bullion valued at $175,386.74; average yield per ton, $20; cost of extraction, reduction and transportation, $155,517.12; yield above production, $19,869.62; tax, $596.08.

Challenge produced 413 tons of ore yielding bullion valued at $7636.13; average yield per ton, $18.50; total cost of extraction, reduction and transportation, $14,954.18; cost of production above yield, $7318 05; no tax.

Alta produced 1817 tons of ore and 40 tons of concentrates yielding bullion valued at $34,967.29; average yield per ton, $19; cost of production above yield, $5892.15; no tax.

Chollar produced 4271 tons of ore yielding bullion valued at $68,626.85; average yield per ton, $14.40; actual cost of extraction, reduction and transportation, $108,593 03; cost of production above yield, $39,966.18; no tax.

Six-Mile Canyon—Ore worked at Hully's stamp-mills in Six-Mile Canyon produced bullion valued at $3200; total cost of reduction, $3070; yield above cost, $130; tax, $2.60.

Recapitulation—The total number of tons of ore extracted during the above quarter, according to the above statement, was 53.363, producing bullion valued at $1,042,327 94. The total product of the Savage, Hale & Norcross, Justice, Overman and Crown Point, not included in the above list, will swell the total to $1,250,000. The bullion product of the lode during the quarter ended March 31, 1889, was $1,300,000.

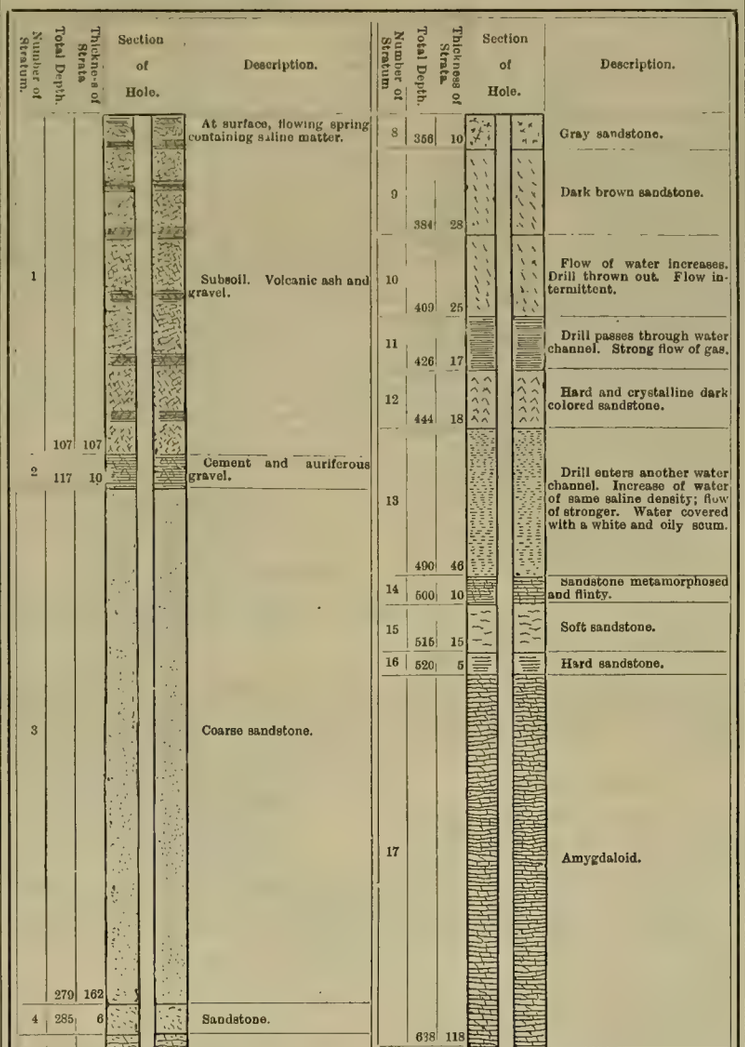
Occurrence of Nickel.

EDITORS PRESS:—Will you be so kind as to let me know what the matrix is of nickel, or what formation it is found in?—R.

The ores of nickel occur, in moderate quantity, in close association with chrome ores, in the serpentine rocks, from Canada to Maryland, and equally so with the chrome ores of the Pacific Coast, notably in Oregon. Dr. T. Sterry Hunt long ago pointed out the general diffusion of nickel throughout the magnesian rocks of the Quebec group. The serpentines of many regions contain chromium and nickel. The most abundant ore of nickel, according to Prof. W. P. Blake, is in the form of a mixture with pyrrhotite or magnetite iron pyrites, which is found more abundantly in the older crystalline rocks than in those of later formation. This form of nickel ore occurs in many places in this country, but seldom averages over two per cent. The presence of nickel in the serpentine rocks of Pennsylvania, associated with chrome ore, is well known by the beautiful green crusts on the massive chromite quarried there. These green crusts, known as "Emerald nickel," are derived from infiltration from small granular nodules of nickel sulphide. Similar coatings of emerald nickel occur upon the chrome ores of Southern Oregon. This ore of nickel, though rich in the metal and very desirable, is not abundant enough to work, and has not been utilized except for cabinet specimens.

The most available ore of nickel, and the only ore worked to any extent in the United States, is the sulphide, occurring in connection with magnetic pyrites. This is an ore which occurs at many places along the lines of the older Archæan rocks.

The ore at Douglass county, Oregon, is found in bunches and pocket-like accumulations in serpentine with chromite.



At New Caledonia the ore known as garnierite is a hydrosilicate of nickel and magnesia. The island is made up of more or less decomposed eruptive rocks, among which the serpentine plays the most important part. The nickel ore is always found in the lodes of serpentine.

At Webster, Jackson county, North Carolina, a silicate of nickel is mined. Its occurrence is thus described by H. J. Biddle, after a careful examination at the instance of the U. S. Geological Survey: "Near Webster is an area of olivine rock (dunite or sherzolite). The rock contains grains of chromite scattered through it nearly everywhere. Throughout most of the area the olivine rock near Webster has been changed to a light-green serpentine, in which are veins or pockets of chromite and veins of talc, and other minerals usually found in serpentine. There are at many points streaks of deweylite and a nickeliferous mineral, which is genthite or some allied species. This occurs in thin streaks. In places it fills all the joints and fissures, but is usually but a thin film." In addition to the above, it appears that nickel is also frequently found in North Carolina in the auriferous sulphides, somewhat in the same manner as in the nickeliferous pyrrhotite of Lancaster Gap, Penn.

According to Mr. W. Q. Brown, nickel occurs on Upper Dads creek, Douglass county, and near Rock Point, Jackson county, Oregon, in veins of pyrrhotite, associated with copper pyrites, and the ore contains a small amount of cobalt. The mines at Nickel mountain, three miles west of Riddle station, on the California & Oregon railroad, show beds of ore. The ores are invariably found either in boulders disseminated through a highly ferruginous earth, or in a stratified bed underlaid by an altered serpentine. Nothing like vein formation has been encountered. Occurring with the nickel ores is chrome iron or chalcedonic silica. A specimen of the unaltered country rock from Nickel mountain was determined by George P. Merrill of the National Museum at Washington, as chiefly olivine, with a mineral of the pyroxene group, probably cronzite. The nickel silicates found near Webster, Jackson county, N. C., are the result of the decomposition of an olivine rock, and the occurrence in Southern Oregon can be similarly explained. The association with chrome ores adds to the analogy between the two occurrences.

Prof. F. W. Clarke has further substantiated the view advanced by Mr. Biddle as to the genesis of these silicates of nickel, and has extended the comparison to the silicates from New Caledonia.

In Saline county, Arkansas, near Benton, 23 miles south of Little Rock, the nickel ore millerite is found in commercial quantities. It runs 54½ pounds nickel to the ton of rock. The vein which bears the nickel is white quartz, running through slate. The deposit is reported as a fissure vein. Besides the nickel there are cobalt, silver, gold (only a trace), iron pyrites and galena. In two of the shafts no galena was found, but only millerite, but assays gave nearly always silver from a trace up to 6½ ounces. In the third shaft galena was struck with the millerite and assays 30 ounces of silver. The mine is on a silver-bearing belt which stretches from the Kellogg mine, north of Little Rock, in a southwesterly direction through the State. The granite crops out in places in Saline county.

SECTION OF ARTESIAN BORING IN SHASTA VALLEY BASIN.—See page 123.

CRUSHING.—Messrs. James Leffel & Co., Springfield, O., report a brisk demand for their improved Leffel turbine water-wheels. They are not only valuable motors for furnishing power for mining plants, but also find a vast field of usefulness in the other great industries. We notice the company have recently shipped to the Marquette Electric Company, located at Marquette, Mich., a pair of 40-inch twin Leffel water-wheels which will be used to develop 350-horse power.

THE PELTON WATER-WHEEL.—The Pelton Water-Wheel Company report great demand for their wheels from all parts of the country. Five have recently been furnished to the Giant Powder Company for their new works at Clipper Gap; four have gone to Colorado, three to Idaho, three to Montana, and various orders are in hand from Alaska, China, Japan, Central America and other distant parts.

AN ASTEROID.—The director of the Lick Observatory is notified by telegraph of the discovery of an asteroid by Charlois, at Nice, on Aug. 3d, at 11 hours, 48 minutes, Greenwich time. Its position was R. A. 21 hours, 23 minutes, 24 seconds; and December, 13 degrees, 4 minutes, 22 seconds. Its motions were west and north 41. Its magnitude was 13.

AT the new Occidental mill, on the Comstock, the pulp from the batteries all flows over the Frue concentrators. The concentrates drop from the tables into a receptacle and the residue of the pulp flows into the tanks and is then transferred to the amalgamating pans. By this double process the ore is worked up to within 15 per cent of its assay value.

"WALLS doubtless influence the pay that is found between them, but the poorest pay a miner finds is within the four walls of a saloon."

Assaying Notes.

[NUMBER 2.]

Testing Silver Ores.

To learn, in a simple way, whether the ore you find contains silver, grind a few ounces of the ore to powder between two rocks; add to it about one-tenth as much salt and about half the quantity of sulphate of iron, often called copperas; mix all together and put it into an old shovel or frying-pan which should have been previously smeared with clay or mud and dried; then roast it over a fire, being careful to stir it often with a piece of stout iron wire. Let the roasting proceed quite gently so long as a smell of burning sulphur can be perceived, not allowing the heat to exceed a dark-red, as seen at night. When the fumes of sulphur cease, let the heat increase to a rather light red, but not so as to melt the ore, stirring it still with the wire.

The smell will now be that of chlorides, rather pungent, often sweet as of new hay, but very easily distinguished from that of sulphur. The ore will swell and appear woolly and somewhat sticky, and a few minutes of this hotter roasting will finish it well enough for your purpose. Now transfer the roasted ore to a flat rock and let it cool; add a little more salt and enough water to make it like mortar; imbed in the mass a strip of clean sheet copper, and let it remain ten minutes; take the copper out, and without touching the part that has been in the pulp, wash the mud off it with clean water. If the ore contains silver, it will invariably show as a white coating on the copper, and as no other metal will so coat the copper under these conditions, the appearance of such a coating is proof positive of the presence of silver. The white coating will be heavier or lighter, according to the richness of the ore. If very heavy, it will appear gray and rough.

In making the above test you will require salt, sulphate of iron, an old shovel or frying-pan, a piece of stout iron wire and a strip of sheet copper about six inches long.

By making a few tests in this way with ore which is known to contain silver, confidence will be acquired. The sulphate of iron is not required if the ore contains sulphurets, but as you may possibly be deceived on this point by substances resembling sulphurets, it is best to make sure by using it in every case.

Many, in fact, most silver ores, will indicate the presence of silver by simply mixing about an ounce with boiling water, salt and a little bluestone in a teacup, and placing the strip of copper in it for a few minutes, while keeping it at a boiling heat; and as this is simpler than the roasting, it is well to try it first. If the copper becomes whitened you may be sure you have silver, unless indeed it should be quicksilver, which, however, you will hardly meet with in the silver regions, and which is easily known by slightly heating the copper in the fire, when quicksilver will be driven off, but silver will not. Most miners will find no difficulty in distinguishing between the two by simply rubbing with the finger. For this test you will require salt, bluestone, a strip of copper and a teacup, or a basin which can be set on the top of an empty oyster can, in which a little water is kept boiling so that the basin with its contents is kept hot. This test has been tried with many samples of silver ore and it has never failed. Yet the first one is still more certain.

Some prospectors test ore by heating a small piece red hot and then plunging it into water, when the more fusible metals it may contain appear on the surface in the form of globules. This method is not reliable, because other metals besides silver show themselves and either be mistaken for silver when it does not exist, or disguise it where it does.

The most generally known method of testing for silver is by acting upon a little ore powder in a test tube with nitric acid, and adding salt to the clear solution thus formed. If the silver is present, it appears as a more or less dense cloud, or if in a very small quantity, as a slight milkiness in the acid. This method is open to two objections. In the first place, some of the richest ores of silver are not acted on by nitric acid, and would, therefore, show no sign on addition of salt; and in the second place, lead gives the same appearance as silver, as does also quicksilver, and though an expert would easily distinguish one from the other by further tests, yet these defects render the method unsuitable for the common prospector, besides which, nitric acid is not a very nice thing to pack with provisions and blankets, nor to handle in the desert.

These tests we take from C. H. Aaron's "Testing and Working Silver Ores," published by Dewey & Co. As will be seen from these brief extracts, the little book is a very practical one, written so as to be understood by common miners and prospectors. The methods of testing for a process are described, and also the various methods of working silver ores.

Pliocene Deposits of Siskiyou County.

The following is a letter to Jas. H. Crossman, the author of the articles on the "Northern Counties of California," now being published in the PRESS:

COTTAGE GROVE, Siskiyou Co.

Friend Crossman: I received by last mail the receipt for subscription and back numbers of the MINING AND SCIENTIFIC PRESS. I have read your articles with interest and pleasure, and if you go on and write up fully there should be certainly material enough for a special edition of some kind, which ought to sell well among people living in the section described.

The Pliocene deposits of this county ought to be thoroughly prospected. Only the outskirts have so far been seen. It will probably be some years yet before they will be opened by miners. The State ought to take a hand.

I have been thinking over the subject since reading your articles in the PRESS, and have arrived at the conclusion that not one, but several, cataclysms occurred before it subsided. First, the mastodon bones in the clay formation; second, the immense gravel-beds lying on the clay. The action that caused the deposit of clay could not have been the same as that which deposited the gravel. How often has the topography, grade, etc., been changed?

The more I study on the subject, the more I am confirmed in my crude theory of upheavals. No other theory affords an explanation. Look at the bedrock on the slope toward the streams. It is always rough. I never saw any signs of a wash, while that on the slope the other way (into the channel) is invariably polished. And the rim rock that defines the channel in every instance—if a gradual subsidence was the order, how does that always remain in place? Whether caused by upheaval or otherwise, the change was sudden.

The volume of water in the river is about as small as it gets to be, and is falling every day. If the bed was not filled or raised by detritus, there would be some good pickings, but the water is on a higher level than it was some years ago. Yours, E. C. GOODWIN.

Local Jealousies.

A stranger will often see and learn more of a locality in a week's visit than a man who has always lived there. This may seem untrue, but think a moment: when we know we can visit a noted spot we are apt to neglect it until such delay becomes chronic, whereas, if we are tourists and never expect to return, we are determined to see all during our short stay. One thing that visitors to California notice is our lamentable local jealousies. Instead of working for our State and being content if we attract good settlers here, we seem only to care for our own burgh and in decrying our neighbor's faults we merely draw attention to our own disadvantages, and finally the intending immigrant leaves us in disgust for his old home. Our State is large, its attractions varied; let us not divide it, but let the California of '99 be the same, except for the progress which we could not check if we would, as that which greeted the gold prospector of '49. San Diego has a fine harbor; San Francisco should rejoice that the endangered mariner has a safe retreat. Mexicans may lack the enterprise of Yankees, yet the day will come when our border city will be populous. This, however, should not make Los Angeles lose that temper which the "Queen of the Angels" should always have. If her Southern sister have the advantage of a natural harbor she is a railroad city, and after the last "boomer" has disappeared from her streets she can calculate on a healthy growth. Oakland need not be jealous of the Bay City; instead of deterring would-be residents she should encourage them. Whatever helps one city helps the other; united they stand but divided they fall. Why should Napa and Santa Rosa be enemies? They are in different counties, and although the vineyards of each are celebrated we fail to see how either can be benefited by underhand slander. If the Eastern man intending to settle in Napa county be driven away for fear of phylloxera, it does not follow that he will be attracted to Sonoma; on the contrary he will probably determine to have nothing to do with grapes. Let us turn over a new leaf, although it be a long way from New Year's Day, and work for our whole State. We need population; this will give us better home markets and we shall not be at the mercy of Chicago. Anything that helps one part of the State benefits all, just as the arm gets strength from the food which pleases the taste of our palate.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Purchase and shipment of Mining Supplies A SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
One 3-inch Sergeant Drill.
One 5-ft. Double Screw Drifting Column with Arms.
One 4-ft. Single Screw Stoping Bar.
One 3½x13 ft. Air Receiver.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the
PAYMASTER MINING CO.,
Yuma, Arizona Territory.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron bangers for top saw. Friction feed-works, patent steel screw double-throw head-blocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,
San Francisco, Cal.

FOR SALE.

One Set Hoisting Machinery and Two Boilers.

Engines 10"x 12" with Corliss frame Two Reels 41"x 30"; cog gear. Everything complete for rapid and efficient work. Machinery built by National Iron Works.
Boilers 48"x 16'. One with 3½", the other 3" tubes. In good repair, built by Wm. McAffee, of best iron in use. Will sell cheap for cash. Inquire of

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents to DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING AUG. 6, 1889.

408,398.—HARVESTING MACHINE—James H. Adamson, North Melbourne, Victoria.

408,400.—STEAM MOTOR FOR PUMPS—H. O. Beatty, Sacramento, Cal.

408,406.—WATER ELEVATOR—A. H. Elfers, Phœnix, Ariz. Ter.

408,407.—PACKING FOR STUFFING-BOXES—Ensign & Wright, Berkeley, Cal.

408,608. REMOVING VERMIN FROM PLANTS—E. P. Fowler, National City, Cal.

408,409.—HOSE COUPLING—W. W. Hanscom (deceased), S. F.

408,617.—SUPPLY AND WASTE COCK—Clark Hay, Portland, Or.

408,237.—ROLLER BEARING—R. W. Hent, S. F.

408,482.—OAR—H. F. Hicks, Ashland, Or.

408,412.—HEADER AND THRASHER—Benj. Holt, Stockton, Cal.

408,413. — TRAVELING THRASHER — Holt & Draper, Stockton, Cal.

408,623.—MOLD FOR ARTIFICIAL STONE FENCES—J. & H. Jessen, Santa Ana, Cal.

408,417. — COUNTER-SHAFT, ETC. — P. H. Kroncke, Santa Rosa, Cal.

408,246.—CARTRIDGE SHELL—W. R. Lindsey, Arcata, Cal.

408,351.—GATE—L. W. Loughary, Monmouth, Oregon.

408,421.—VEHICLE BRAKE—Jno. Mani, French Gulch, Cal.

408,434.—HOSE COUPLING—Jas. Pringle, Silver King, Ariz. Ter.

408,356.—GAS ENGINE—D. S. Regan, S. F.

408,525. — TIDE-POWER — J. Ringen, Coronado, Cal.

408,440.—AUTOMATIC BELL-RINGER—W. W. Slater, Oakland, Cal.

408,360.—WATER-PROOF LEATHER—A. Sommer, Berkeley, Cal.

408,443.—CABLE R. R. TURNTABLE—J. C. H. Stut, S. F.

408,445.—VEIL FASTENER—P. N. Tryon, S. F.

408 279.—ZINC ELECTRODE—J. B. Williams, Oakland, Cal.

The following brief list by telegraph, for Aug. 14, will appear more complete on receipt of mail advices:

California—John M. Adams, San Francisco, two patents for ore-concentrator belt; Hans C. Behr, assignor of half to B. T. Lacy of San Francisco, adjustable gear for crushing rolls; Ernest H. Chesterton, Los Angeles, finger guard; Byron Jennings, San Jose, conduit for electric railway; Alva L. Reynolds, Elsinore, solar water-lifting apparatus; Oscar W. Schmidt, assignor of half to J. S. Cohen, San Francisco, driving or stop mechanism; Chester William M Smith, San Francisco, railway car.

Oregon Jacob C Welcome, Burns, reversible safety stirrup; Giles W. Weller, Baker City, ore-crusher; Samuel Rothchild Pendleton, harrow.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAS ENGINE.—Daniel S. Regan, S. F. No. 408,356. Dated Aug. 6, 1889. The improvements consist in making the piston a part of the electric circuit and fitting one of the electrodes to it, while the other electrode, properly insulated, is so arranged within the cylinder as to be touched by the piston electrode at each stroke so that the circuit is closed and broken at each stroke of the piston. The object of the invention is to provide an explosive gas engine with an igniter, the operation of which shall be dependent upon the movements of the engine piston, and to close and open the electric circuit by the stroke of the piston.

CABLE RAILWAY TURNTABLE.—John Ch. H. Stut, S. F. No. 408,443. Dated Aug. 6, 1889. This turntable is so constructed that it may be introduced into the track at any point in the line and may be turned around so as to reverse the car by the direct action of the traveling cable, and without the necessity of depressing the cable in any way in order to clear the table or in any way interfering with the action thereof, or using any supplemental connections to turn the table.

HOSE COUPLING.—James Pringle, Silver King, Arizona, assignor of one-half to Rob't Bowen of same place. No. 408,434. Dated Aug. 6, 1889. The claim in this patent is: "In a hose coupling, the opposing coupling heads, one of which is provided with the grooves or bolt-seats in combination with the bolts, pivoted in the opposing head, the cam-faced disks in the ends of the bolts, the levers having the cam-faced heads bearing against the disks, the sleeves of said heads and the springs acting against the sleeves to hold the lever-heads in place."

AUTOMATIC BELL-RINGER.—Wm. W. Slater, Oakland. No. 408,440. Dated Aug. 6, 1889. This is a device for automatically ringing a bell. It is specially adapted for ringing cautionary or alarm bells such as are employed at railroad crossings and for other similar purposes. It consists in a bell fixed in a suitable supporting frame, and having a swinging tongue or clapper with a mechanism for actuating the same which is operated by the pressure of air upon a piston within a cylinder, and in connection therewith of an electro-magnet device, whereby the valve is opened to admit air to the operating cylinder, the circuit being alternately made and broken by the movement of the piston.

WATER ELEVATOR.—August H. Elfers, Phœnix, Arizona. No. 408,406. Dated Aug. 6, 1889. This relates to that class of water elevators in which buckets are attached to and carried by endless chains, whereby said buckets are successively carried down into the water so as to fill them and raised therefrom and adapted to discharge their water at the top. The object is to provide a practical and effective elevator for raising water from wells and streams or other source of supply for irrigating land, and for all other purposes for which large quantities of water are required.

HEADER AND THRASHER.—Benjamin Holt, Stockton. No. 408,412. Dated Aug. 6, 1889. The improvements in combined headers and thrasher covered by this patent are especially applicable to the header portion of the apparatus, and consist in certain constructions and combinations of devices whereby the power may be transmitted from the thrashing machine portion of the apparatus to the header portion of the apparatus, and certain changes of direction made in transmitting this power so as to accommodate the intermediate machinery to the relative positions of the header and thrasher, the front of the header not standing at right angles with the thrashing machine.

TRAVELING THRASHER.—Benjamin Holt and Jabez Draper, Stockton. No. 408,413. Dated Aug. 6, 1889. This patent covers certain construction and combination of mechanism, and the especial features of the invention are in the use of a system of chain driving which supersedes the use of gears and belts, whereby the machine is made to run lighter than it would with gears, and with no annoyance from slipping, such as will occur when belts alone are used. It also covers the relative arrangement of the chain-driving system, so that the portion which includes the thrashing and feeding mechanism and parts intimately connected with these are driven from one portion of the system, while those parts which belong properly to the separating and cleaning mechanism are driven from another portion of the system.

PACKING FOR STUFFING-BOXES.—Chas. H. Ensign, Temescal, and Phin B. Wright, Berkeley. No. 408,407. Dated Aug. 6, 1889. The invention relates to the class of stuffing-boxes of piston-rods, valve-rods, pump-rods or any reciprocating part about which a tight joint is required to be formed; and the invention consists in certain combinations and constructions. There is little wear on the packing, and it can always be kept well set up. It can be easily applied and as easily removed, and is very durable.

STEAM MOTOR FOR PUMPS.—Henry O. Beatty, Sacramento. No. 408,400. Dated Aug. 6, 1889. The object of this invention is to provide a steam motor or engine specially adapted for the operation of pumps in which the whole expansive power of the steam is employed to move water (or any other heavy substance it may be desirable to raise for a limited distance) in a vertical line without the use of any crank or circular motion, the power being used only in the ascending line, the return movement being wholly by gravity.

COUNTER-SHAFT AND BELT-TIGHTENER.—Peter H. Kroncke, Santa Rosa. No. 408,417. Dated Aug. 6, 1889. The invention relates to a counter-shaft and driving pulleys and a movable or tilting frame upon which said shaft is journaled, with a means whereby the frame and shaft may be moved so as to tighten or slacken a belt from a continuously running driving shaft, whereby power may be transmitted through the counter-shaft and said shaft started and stopped at pleasure. Various arrangements of this mechanism may be made.

HOSE COUPLING.—Abbie P. Hanscom, S. F., executrix of W. W. Hanscom, deceased, assignor to H. D. Bacon. No. 408,409. Dated Aug. 6, 1889. This invention relates to an improved construction of hose couplings and is especially applicable in making the couplings of pipes which are to convey air or other elastic medium, as in the cases of pipes for air-brakes. It consists of flexible coupling pipes with collars fitted upon the meeting ends of the pipes to be coupled, and having thin flexible flanges projecting a short distance from the periphery toward the center of these ends, so that when the ends are brought together and retained in this position the pressure from within the pipe will force these flanges together and prevent leakage. The exteriors of the pipes are encircled by metal collars having lugs upon opposite sides and hook levers fulcrumed between these lugs, so that the hooks of the levers fulcrumed upon the collar of one pipe will engage with the flange of the opposite pipe and hold them together. The opposite ends of the levers are bent so as to rest upon the elastic surface of the flexible pipe, and the pressure within the pipe acts upon these levers so as to retain the hooks in engagement with the opposite flanges.

Mining Personals.

Joseph G. Hoar is pumpman at the Parrott mine, Montana.

W. E. Sharon, superintendent of the Yellow Jacket, is in the city.

H. W. Sparks is superintendent of the Red Lion, Georgetown, M. T.

Thos. Brown has charge of the Bonanza mine, Harqua Hala, Arizona.

George L. Brown, a mining man of West Point, Calaveras county, is in the city.

Ben Thayer of Butte is successor to Walter Banks as foreman at the Bi-Metallic mine.

W. C. Price has been re-elected superintendent of the Navajo mine, Tuscarora, Nev.

Clarence King, the well-known geologist, is in business at El Paso, but is now visiting New York.

W. A. Cowles of Battle Creek, Michigan, is now extensively interested in mines at Sparta, Oregon.

Charles Derby has been appointed superintendent of the Lady Washington mine, on the Comstock, vice E. D. Boyle.

E. C. Scoville and J. F. Hawes, two Idaho mining men, are on the way to South Africa to examine the gold-fields there.

L. N. Smith is in charge of the mine workings of the Wasatch group in Blue Ledge district, Utah, east of the Ontario.

Dwight Crittenden, formerly superintendent of the Bodie mine, is in Norway examining some mining properties for English capitalists.

S. W. Harney has just sold his interest in the Baltimore group of mines, near the Woodside and Mayflower, at Park City, to Denver parties.

G. M. Sprague of Central City, Colorado, and J. Leonard of Denver are in Park City, Utah, examining mining properties with a view of investing.

H. W. Sparks is superintendent of the Diamond Mining Co., owning a group of claims across the gulch from the Red Lion, Georgetown, Montana.

Mr. A. Breece of Bath, Placer county, is in this city. His mine is paying splendidly, averaging $30 a car for several days prior to Mr. Breece's departure.

Mr. Moore, who has been superintendent of the Buchanan mine, Tuolumne county, has resigned on account of ill health. He has been succeeded by James Hamilton.

C. W. Goodale, superintendent of the Gagnon and other mining properties of the Colorado Company, has returned to Butte, M. T., after a six weeks' vacation spent in the East.

Wm. J. Jameson, the youngest of the engineers at Butte, has given up his position as engineer of the Parrott, and gone back to Pennsylvania. Joseph Corby has been appointed to the vacancy.

Thos. Benny and W. B. Hocking have purchased a controlling interest in the Bluejay mine, Washington township, Nevada county, and contemplate making developments on an extensive scale.

Robert Taite, a millwright, who constructed the Mountain View hoisting works and many others in Butte, M. T., has returned from the Cœur d'Alene country, where he has just finished constructing a concentrator for Messrs. Huzzy & Co.

James Stahl, former owner of the Hawkeye mine in Spring gulch, after being out several months prospecting, has struck another bonanza. He relocated the old White Cloud property, about 25 miles from Missoula, M. T., and has been quietly developing it for several weeks.

L. B. Hopkins was down at Keeler, Inyo county, the other day looking after some mining interests. He was a superintendent on the Comstock in early days, and one of the pioneers of Aurora and Bodie. He was also at the Julian mines, San Diego county, for a year after the mines were first discovered.

Hoop-Clamp for Large Tanks.

(*Continued from page 121.*)

Practically considered, this device has proved a great success. By its use, Wells, Russell & Co. of the Mechanics' Mills have set up some tanks as large as 36 feet in diameter, and these have been made perfectly water-tight without any difficulty.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Assessment Notices.

ASSESSMENT NOTICE.

California & Nevada Railroad Company.—Location of principal place of business, San Francisco, California. Location of Railroad, Alameda County, California.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1889, an assessment, No. 1, of Fifty Cents per share was levied upon the Capital Stock of the corporation, payable immediately in United States Gold Coin to the Secretary at the office of the Company, Room 12, No. 320 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of September, 1889, will be delinquent and advertised of sale at public auction, and unless payment is made before, will be sold on Monday, October 14th, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. A. PHELPS, Secretary.

Office, Room 12, No. 320 California Street, San Francisco, California.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of Principal place of Business, San Francisco, California. Location of Works, Placer County, California.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 13th day of August, 1889, an assessment, No. 14, of Four Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, 327 Pine Street, Room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of September, 1889, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 8th day of October, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

O. H. BOGART, Secretary.

Office, 327 Pine Street, Room 9, San Francisco, Cal.

RUBBER FACTORY.

Monarch Belting.

The Plies of this Belt are

UNITED by COTTON RIVETS

Which hold them firmly together.

Each Rivet is Independent

And Follows the Stretch.

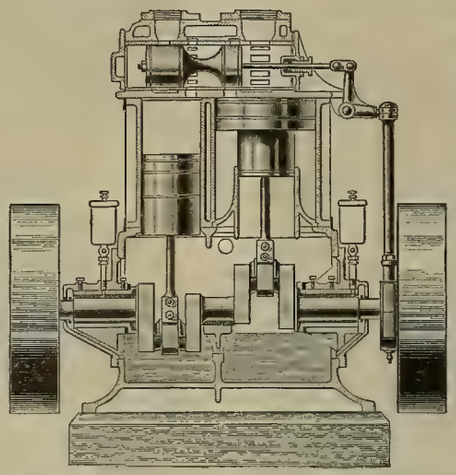
THERE ARE NO STITCHES TO BREAK, and

The Belt has a Smooth Surface.

Hose, Belting, Packing, Etc.

ALL KINDS OF RUBBER GOODS MADE TO ORDER IN A FEW HOURS.

W. F. BOWERS & CO., 409 Market St., San Francisco.



PARKE & LACY COMPANY

IMPORTERS AND MANUFACTURERS OF

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,
AIR COMPRESSORS, ROCK DRILLS,
WALL'S CRUSHING ROLLS,
CONCENTRATORS, PULVERIZERS,
TURBINE WATER WHEELS,
ROCK BREAKERS, DRY JIGS

Golden Gate Concentrators,
GREATEST CAPACITY
OF ANY CONCENTRATOR MADE,
One Machine Taking Pulp from 10 Stamps.

SAW MILLS, MACHINE TOOLS,
PLANING MILLS, INJECTORS and EJECTORS,
BELTING, PACKING, OILS, LUBRICATORS,
FIRE EXTINGUISHERS,
CENTRIFUGAL PUMPS,
ROTARY PUMPS, GANG EDGERS,
CAMPBELL'S STEAM FEEDS,
MILL and MINE SUPPLIES.

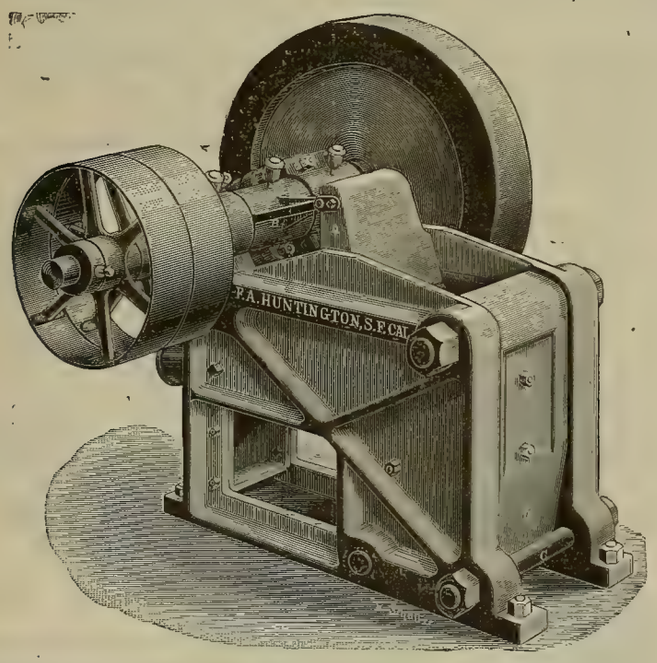
GENERAL AGENTS FOR

WESTINGHOUSE AUTOMATIC ENGINES.

SALES DURING LAST FOUR MONTHS:

COMPOUND, 44 ENGINES, 5215 HORSE POWER. STANDARD, 99 ENGINES, 4500 HORSE POWER. JUNIOR, 166 ENGINES, 4260 HORSE POWER.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

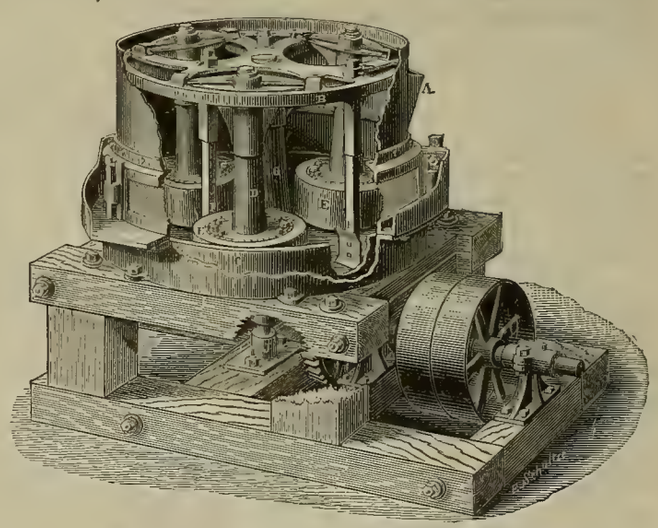


21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

WIRE WORKS.

D. D. WASS, 141 & 143 First St.

WIRE WINDOWS, GUARDS, OFFICE SCREENS, FENCING,
GATES, ROOF CRESTING and WROUGHT IRON WORK.

Buildings and Steamships Wired for all Systems of Electric Lighting. Telephone No. 1508.

AMALCAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sampie Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL AND SECTIONAL.

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

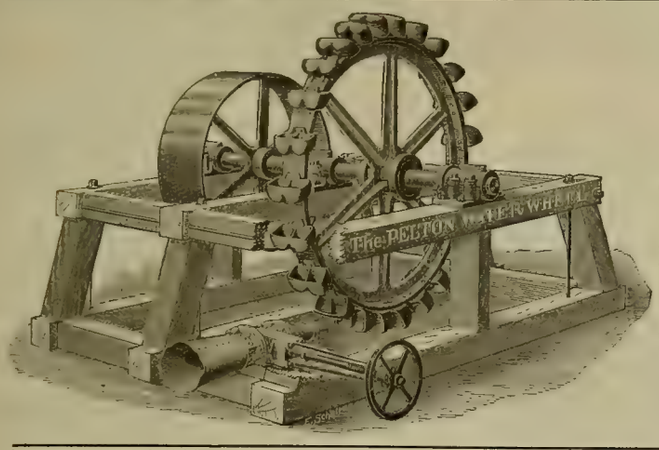
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.



Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

☞SEND FOR CIRCULAR. Address:

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 15, 1889.

General trade shows a steady increase in all branches, with the buying, as a rule, still of an assortment character. It is claimed that taken as a whole interior merchants are lightly stocked, and when fall buying sets in business will be more active than for several years past. It is also claimed that this fall interior merchants will be in good shape financially, owing to the good crops, fair prices, and farmers not having speculated much, if any. The land boom of two years ago caused many to speculate beyond their means, which has "run them close to windward." Manufacturers and ironworkers report a steady improvement in their special branches of trade.

The local money market is reported easy. The call for accommodation on wheat stored in warehouses is, as yet, light from city banks It is reported by operators that warehousing in the interior is quite general and that farmers are getting loans, so far, from local sources. It is generally conceded that when harvesting is well over and heavy deliveries of grain set in, quite an active demand will rule for accommodations on warehouse receipts. It now looks as if the wheat crop will go all of 1,800,000 tons, but the barley crop will not be as large as that of last year. Canned fruits and dried fruits are beginning to move and at fairly remunerative prices.

Exchanges on New York are offering more freely, and as the inquiry is only fair the rates are against sellers.

The treasure shipments hence in last month compare as follows with the like month in 1888:

	1888.	1889.
Silver bars	$959,600	$470,160
Mexican dollars	280,641	777,872
Peruvian dollars	4,627	.....
Silver coin	.....	5,000
Gold coin	838,705	229,431
Gold dust	470	410
Currency	204,000	18,892
Totals	$2,288,043	$1,521,766

The amounts and descriptions of specie shipped from San Francisco in the first seven months of the year compare as follows:

	1888.	1889.
Silver bars	$5,834,250	$5,207,560
Gold bars	1,400	.....
Mexican dollars	1,861,415	5,261,801
South American dollars	10,235	41,131
Gold coin	3,994,333	3,827,104
Silver coin	30,344	92,000
Gold dust	2,796	2,545
Currency	809,230	707,993
Totals	$12,544,008	$15,140,134

The steamer City of Peking, hence Aug. 13th for China, took out the following treasure: To Hong Kong, Mexican dollars, $203,190; gold coin, $4041; gold-dust, $70; silver bullion, $39,300. To Shanghai, silver bullion, $66,000; to Japan, silver bullion, $44,000; Mexican dollars, $149,000; to Higo, silver bullion, $89,000.

MEXICAN DOLLARS—There was fair inquiry for shipment by the last outward steamer for China. The price remained steady at last week's quotations, closing at 73¾ for old and 74¼ for new.

SILVER—The market is quiet but firm. As high as 93 cents is reported to have been paid for bullion for shipment by the last steamer that sailed for China. The market opened the week under review at 92½ to 92¾, and gradually strengthened until 93 cents was reached. At the close 92½ cts. is given as the quotations, with very little, if any, inquiry. Receipts are reported to be light.

QUICKSILVER—Receipts the past week were very light, aggregating only 60 flasks. The demand is reported to be only fair, but with light receipts and high markets abroad, ours rules very strong.

ANTIMONY—The market is strong and quotable higher in sympathy with the East, where a scarcity is reported.

BORAX—Receipts the past week aggregate 1486 centals, and the exports as follows: Victoria, B. C., 222 pounds; Boston, 20,937; New York, 20,270. The market is reported firm at unchanged quotations.

LIME—Receipts the past week aggregate 4001 barrels, while the shipments by sea were only 40 barrels to Honolulu. The home demand is good, with quotations unchanged.

LEAD—The market is without change. At the East the market is irregularly dull.

COPPER—The market has shown a fair degree of strength in sympathy with a steady and fairly firm market at the East and abroad. The consumption, the world over, is reported to be increasing, while the output, except in America, is decreasing.

TIN—The imports the past week were 206 boxes plate, overland. Notwithstanding the higher markets abroad and better outward freights, our market does not show any advance for spot, although for shipment a slight advance is obtainable. At the advance our advices indicate that the output abroad will be increased.

The shipments by sea from this port the past week aggregate as follows: Santa Rosalia, 206,800 pounds; Victoria, B. C., 281,922 pounds plate and 8535 pounds pig.

IRON—Imports the past week aggregate 200 tons from Newcastle, England. The market both for spot and to arrive is heavy. Holders to sell have to shade prices, but consumers to buy have to pay full prices. The stock here is still heavy, although it is reported to be gradually decreasing. Foreign and Eastern advices report strong and fairly active markets.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow.	Aug. 1, '89.	Aug. 7, '89.
No 1 Coltness	57s 6d	57s 6d
" Langloan	56s 6d	56s 6d
" Summerlee	57s 6d	57s 6d
" Gartsherrie	55s 6d	55s 6d
At Ardrossa.		
No. 1 Eglinton	46s	46s 6d
" Glengarnock	53s	54s
" Dalmellington	47s 6d	48s

COKE—Imports the past week aggregate 984 tons from Newcastle, England. Quotations are difficult to get correctly. While some claim that 25 to 50 ton parcels on spot can be had at $14.50 to $15, yet large dealers claim that our quotations are correct.

COAL—Imports the past week were as follows: Australia, 8350 tons; Coos Bay, 750; Tacoma, 5100; Seattle, 1890; Cardiff, 1461; Departure Bay, 5550. Total, 22,301 tons. Australian has been advanced with one sale of a cargo to arrive at $7.25 a ton. The advance is due to a scarcity of ships at the supply ports and in consequence higher charters asked. For coast coals there are no changes in prices to report. The spot market is reported strong with a good demand.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Aug. 14, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	92½	$11 85	$3 87½	$19 90
Friday	42½	92½	11 90	3 85	19 95
Saturday	42 5-16	92½	11 90	3 85	19 90

Mining Share Market.

The past week witnessed more general activity in mining stocks than for some time past, and as the general tendency of prices for the Comstock was upward, there was not only a more cheerful feeling, but a more general gathering of outside dealers ready to be fleeced. When the market was dragging at low prices, everything was pictured the darkest, and no one, only those who have seen dark days before, cared to buy; but now with big bull points afloat, and rumors of ore strikes being circulated, there appears to be more of a scramble to "get in" before prices jump out of their reach. While the writer is neither a prophet nor the son of a prophet, or professes to see further than any other outsider into the mysterious ways that insiders have of manipulating the market, yet he would advise caution in buying, for the conditions, unless there are a large number of moneyed short-sellers on the market, are against much of a bull movement at the present time. Money will soon begin to go out to aid in moving the wheat crops, while merchants will not, for about two months yet, begin to receive free remittances from the interior, and last, but not least, there are too many persons who operate at times in stocks at work on the farms and railroads, besides which the work in the mines does not indicate anything of importance being developed for some time to come. In outside stocks, trading the past week was light. The Quijotoas made a slight move up; the Bodies barely held their own, while the Tuscaroras set back, with Commonwealth making quite a break, owing to the managers shutting down the mill, and, so reported, doing other things to depress the stock. When the price was over $5 a share, nothing was too good to be said of the prospects, but now with the stock down, nothing is too bad to be said. It looks as if the manipulators are getting ready for a deal in the stocks by inviting short-selling.

The market opened this (Thursday) morning, barely steady at last night's lower prices. The general tone points to a small up, before going much, if any, lower.

The news from the Comstock mines indicates that preparatory work of more importance is to be inaugurated soon along the entire lines, but more particularly in the Middle and Gold Hill groups. The work of extending the 500-foot and 1300-foot north lateral drift from the Yellow Jacket shaft is being vigorously pushed, and soon they will be in position to start a series of crosscuts from these two levels in all the mines extending from Yellow Jacket to Bullion. The Ward shaft is being repaired preparatory to extensive explorative work on the various levels down to the 1500-foot level. Good results are expected to follow the work from this shaft. In Alpha, on the 500-foot west crosscut, a very promising 9-foot ledge was cut. While the ore assays low, yet the indications are of the most flattering character for something still better when they prospect the find. A silence of death is the order regarding the work going on in the Yellow Jacket, and for that reason old and experienced miners are expecting something from that direction before 60 or 90 days roll by. It is claimed that very important work is going on toward the west in the Crown Point and Belcher. Very little of interest can be had from the North End mines, where very important work is or ought to be under way. From the Quijotoas, Bodies and Tuscaroras the same old stale reports come in an official way, but nothing so far from trustworthy private sources.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

VULCAN PILE ARMOR CO., Aug. 10. Object, to treat piles and protect them from the ravages of the teredo worm and to do a general lumber business. Directors—John H. Wise, John T. Davis, Wm. E. Brown, M. Connell and John H. Miller. Capital stock, $150,000.

BRUNSWICK BILLIARD-TABLE CO., Aug. 10. Capital stock, $200,000. Directors—E. Brunswick, Geo. W. Shell, J. J. Scrivner, Joseph Figel and Sol J. Levy.

GOLDEN GATE LUMBER CO., Aug. 13. Capital stock, $100,000. Directors—O. H. Greenwald, D. H. Bibb, A. Heilbrunner, L. H. Greenhood and J. Newbauer.

BURNHAM-STANDEFORD CO., Aug. 15. Capital stock, $120,000. Directors—O. H. Burnham, D. W. Standeford, A. T. Buswell, E. R. Hundley, J. C. Martin. This company succeeds to the planing-mill business of Burnham, Standeford and L. G. Cole, in Oakland.

DIAMOND DISCOVERIES.—We are told that it is reported that fabulous discoveries of diamonds have been made in the Sierra de la Coronilla, State of Guerrero, Mexico. The information is said to have been derived from Government sources, and more particulars are promised.

A DECISION has been given by a justice of the peace that the copper mines near Valley Springs, Calaveras county, have not poisoned the waters of the Mokelumne river. The Fish Commissioners are to bring another suit at Lodi, San Joaquin Co.

WHEN the winter rains set in there will be more stamps available in the vicinity of the Comstock than before in several years, some new mills having been built and additional stamps having been put into others.

Rose's Mechanical Works

MODERN STEAM ENGINES.

An elementary treatise upon the Steam Engine, written in plain language, for use in the workshop as well as in the drawing office; giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 422 engravings. In one volume, quarto, 321 pages. Price.....**$6.00**

Mechanical Drawing Self-Taught; Comprising instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing; together with Examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions, Engines and Boilers. By Joshua Rose, M. E. Illustrated by 330 engravings. 8vo. Price.....**$4.00**

The Complete Practical Machinist. Embracing Lathe Work, Vice Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 356 engravings. Fifteenth Edition, thoroughly revised and in great part rewritten. 12mo, 439 pages. Price.....**$2.50**

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings. 12mo. Price.....**$1.00**

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users, and Inspectors; and embracing in plain figures all the Calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 250 pages. Price.....**$2.50**

☞ *Illustrated circulars, giving the full table of contents of all the above works, sent free to any one who will apply.*

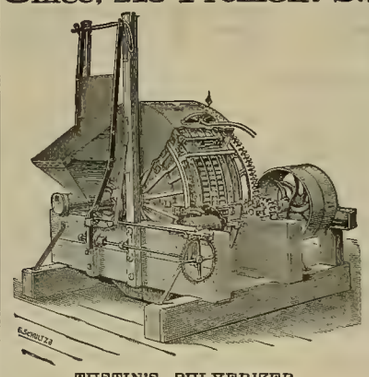
Steam Engines, Saw Mills, Mining Machinery, Dredging Machines, Rock Crushers, Cable Railway Machinery, Ellithorp Air Brake Co.'s Patent Steam and Hydraulic Elevators, Air Cushions and Air Brakes. POSITIVE SAFETIES. Improved Ram Elevators, Sidewalk and Hand Hoists. B. E. Henrickson's Patent Automatic Safety Catches.
Machines of all kinds Made and Repaired. Orders Solicited.

Golden State & Miners Iron Works.
Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.
STEVENSON'S PATENT
Mold-Board AMALGAMATORS,
Golden State Pressure Blowers.
First St., between Howard & Folsom, S. F.

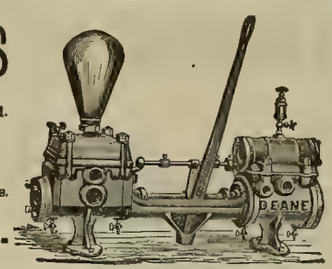
THOMAS THOMPSON THORNTON THOMPSON
THOMPSON BROTHERS,
EUREKA FOUNDRY,
129 and 131 Beale St., between Mission and Howard, S.F.
MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

Mining Engineers.

W. A. GOODYEAR,
Civil and Mining Engineer,
MINING EXPERT AND GEOLOGIST.
Address "Business Box A," office of this paper, San Francisco.



ROSS E. BROWNE,
Mining and Hydraulic Engineer,
No. 307 SANSOME ST., SAN FRANCISCO.



ISRAEL W. KNOX,
Mining and Mechanical Engineer
AND PURCHASING AGENT FOR
Mines, Mining Machinery & Supplies.
Mines Examined, Reports and Estimates Furnished, Contracts made, etc.
Office, 287 First St., San Francisco, Cal.

California Electrical Works
35 MARKET STREET, S. F.
MANUFACTURERS OF AND DEALERS IN
Electrical Apparatus and Supplies, Electrical Gas Lighting, Gold, Silver and Nickel Plating, Mining Plates.
AGENTS FOR
Gamewell Fire Alarm Telegraph, Okonite Insulated Wires and Cables, Gassner Dry Batteries, etc., etc.

INVENTORS, TAKE NOTICE!
L. PETERSON, MODEL MAKER,
258 Market St., N. E. cor. Front (up stairs), San Francisco.
Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
—ALSO—
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.
ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

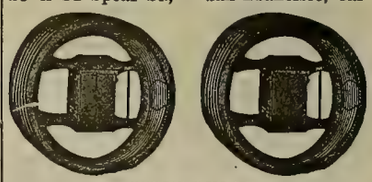
FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 213 Fremont St., San Francisco.

TUSTIN'S PULVERIZER.
—MANUFACTURERS OF—
MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.
Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.

DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.



QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

SHEET-IRON WATER PIPE for Mining and Irrigation Purposes.

ALSO SAWMILL MACHINERY.

Exclusive Agents for the Pacific Coast of HEINE PATENT SAFETY BOILER and MACBETH STEEL PULLEY.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

PACIFIC IRON WORKS

MINING MACHINERY.

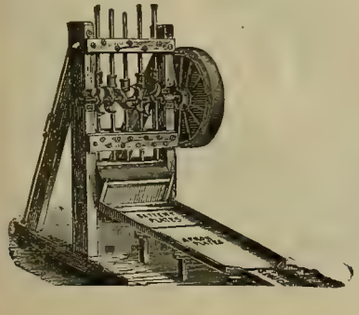
GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

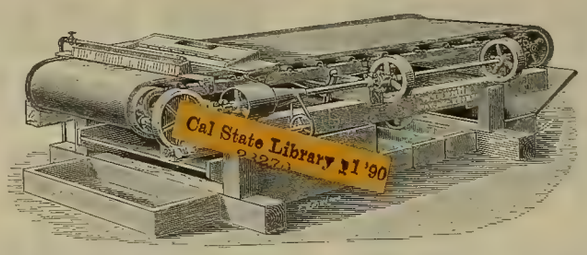
IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of **JOHN TAYLOR & CO., Corner First and Mission Sts.**

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.



Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 3, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

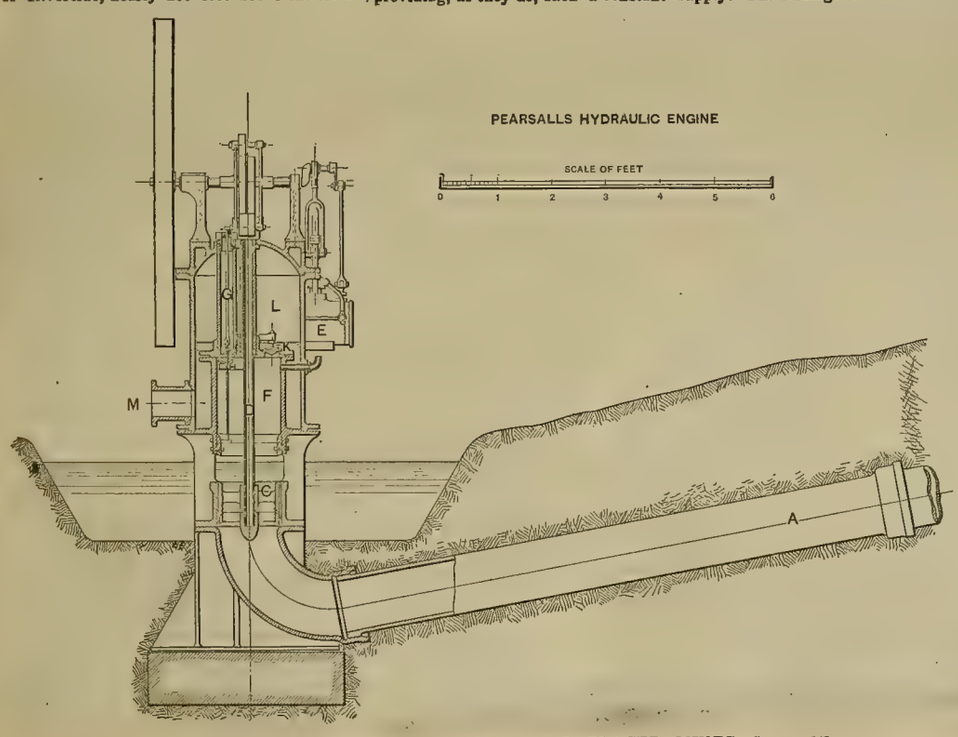
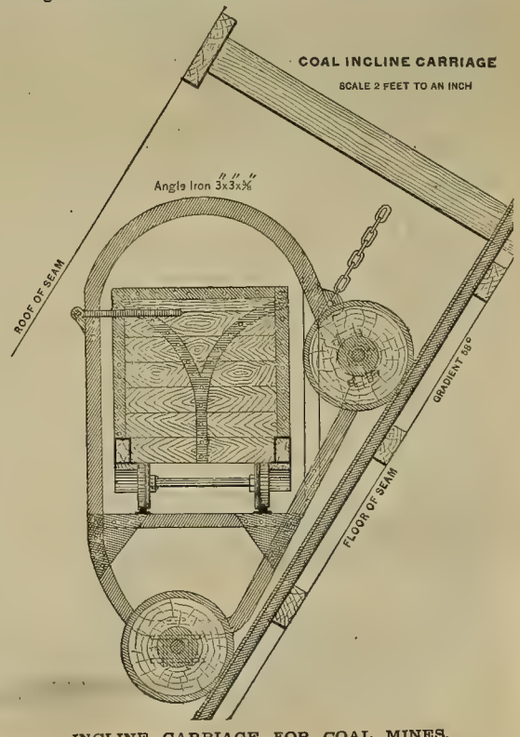
Artesian Wells.



One of the most extensive systems of canals in Southern California is that organized and constructed by Matthew Gage of Riverside. The supply of water from the main canal is taken from artesian wells and the Santa Ana river. Two miles southeast of San Bernardino, and on both sides of the Santa Ana river, is a tract of land owned by Mr. Gage, which is nearly all within the boundaries of the artesian basin of the San Bernardino valley. Upon this he has put down 38 artesian wells to different strata, at depths varying from 150 to 500 feet, and has secured an abundant supply of water for the irrigation of the 12,000 acres under his canal.

The accompanying cut shows a group of six artesian wells at the head of the Gage canal. Several other groups of wells are located near these, and the water from all flows into the Santa Ana river, and at a short distance below, where it unites with the stream, is taken with the water from the river into the canal, by means of a dam. The canal runs southwesterly through the 2400-acre tract above referred to, and for a distance of five miles along its banks other wells can be bored, so that their waters will discharge directly into the canal. The course is still southwesterly along the bluff bordering the river valley, crossing several large arroyos with flumes, and piercing the projecting points of the bluff with some 16 tunnels, until it enters upon the plains of Riverside, nearly 200 feet above the elevation of the canals of the Riverside Water Company. These flowing artesian wells are of the greatest importance to the section in question, providing, as they do, such a constant supply.



FLOWING ARTESIAN WELLS IN SAN BERNARDINO COUNTY.

A Coal Incline Carriage.—We give herewith a cut of a coal incline carriage such as is used at the Kaiping coal mine, North China. The carriage is run on a self-acting incline and the car is run in upon that and hoisted or lowered. The cut shows the construction plainly, and will prove of interest to coal-mine owners.

THE PEARSALL HYDRAULIC ENGINE FOR PLACER MINES.—See page 148.

INCLINE CARRIAGE FOR COAL MINES.

The Properties of Mercury.

Physical Properties.

[Copyright 1889 by HENRY G. HANKS.]

Mercury, as we know it, is a metal in a state of fusion, and the only one yet discovered which is fluid at ordinary temperatures. It is to this property that it owes its great importance in the arts, and especially its value in amalgamation.

It boils at 680 degrees Fah. and becomes solid at a very low temperature, in which state it has no properties in which it differs materially from other metals, or which would render it specially useful if it could be maintained in that condition. The atomic weight of this most remarkable metal is 100 04 by the old system of notation, which is doubled in the new. The symbol by which it is distinguished in chemical language is "Hg.," from *hydrargyrum*, the Latin name for the metal.

Pure mercury is silver white and very lustrous. At 40 degrees above zero Fah., its specific gravity is 15 012. At 40 below it is 13.545, for which reason it sinks when solid in the fluid portion, as stated elsewhere. At the latter-named temperature the weight of a cubic foot is 846.56 pounds avoirdupois.

The specific gravity of mercury being so great, most other metals float on its surface. A mass of cast iron will swim like a cork in a basin of quicksilver. This was strikingly shown in the California department of the New Orleans Exposition of 1884–5. One hundred and fifty-six pounds of California quicksilver placed in a capacious vessel attracted much attention. In all probability not one person in a thousand who visited the Exposition had ever seen one pound of mercury before, while very few had been granted the privilege of plunging their arms to the elbow in this wonderful liquid metal, an invitation they were not slow to accept.

Many ladies sunk their gloved hands beneath the surface, and, eager to enjoy a new sensation, removed their gloves, and, dipping up the quicksilver, actually shivered with excitement as the cold metallic streams flowed through their fingers to the detriment of their gold rings, which whitened to their great surprise, although they had been warned that such would be the case.

A cannon-ball of iron, from the New Orleans battlefield of 1815, floated on the surface, and was regarded with much curiosity by those who did not understand the reason.

Did it ever occur to the reader what a beautiful object a globule of pure mercury is? Pour some into the palm of your hand and hold it exposed to the bright sunlight. Observe how it reflects the glowing rays like a diamond. Let it fall on some flat, hard surface and see it scatter into flying particles, which flash like little meteors. If you wish to continue your investigations, pour out another globule and lay near it a small piece of metal, such as lead, tin, silver or gold, and see with what avidity it will seize on it and never let go. This property is, of all others, the most interesting to us on the Pacific Coast, for so we collect our gold and silver.

Most people know what quicksilver looks like, and probably some of its physical properties; but can any one say why it is liquid at a temperature at which all other metals are solid? Can the reason be given why platinum can only be melted by the high degree of heat generated by electricity, or by the compound blowpipe, while lead melts at 612 degrees, tin at 442 degrees above, and mercury at 39 degrees below zero? Ask the chemist or physicist concerning it, and he will talk learnedly of its specific gravity, its low specific heat, what acids act upon it, what uses may be made of it, and many facts concerning it; but ask him to answer the question propounded above, and he will acknowledge his inability to do so.

The chemist's lore is simply his knowledge of certain physical facts, most of which he obtained from other observers, who have gone before him, with a few discovered by himself and others of his generation, the result in fact of centuries of experimental research.

If our bodies were so constituted that we could endure a temperature of 50 degrees below zero, we might roll our mercury into thin sheets, and wrap our tobacco and soap in them as we do now with tin-foil; and shoot game or conduct warfare with mercury bullets, or eat with mercury spoons and forks. If, on the other hand, we could live at a temperature of 2016 degrees Fahr., which is less supposable, liquid gold might be carried in iron bottles and poured into suitable vessels to be put to some such uses as mercury is now; but mercury, lead, antimony, and some other metals would be in a state of vapor, while platinum would still be a solid metal.

At a temperature at which platinum would remain fluid, gold, silver, and, in fact, nearly all other metals would be in a state of vapor, much as hydrogenium is supposed to be now.

It is not specially difficult to oxidize mercury. Boerhave, the celebrated Dutch physician and philosopher, who died in 1738, made many experiments with this metal. He put a small quantity into a bottle, which he tightly corked and fastened to the sails of a windmill in such a manner that it was constantly agitated. After a time it became wholly changed to a black oxide by motion alone, in contact with the small quantity of air in the bottle. He distilled a portion of metallic mercury 500 times without change.

Mercury is so volatile that it begins to vaporize at a low temperature, even when exposed to the rays of the sun in summer. These vapors are, when strongly heated, highly expansive, and when confined are explosive, as Geoffroy found to his surprise when at the instigation of an alchemist he placed in the fire an iron globe containing mercury, which exploded, and the metal was dissipated in invisible fumes.

If frozen mercury be thrown into warm water, the metal becomes fluid and the water solid at the same instant.

When it was discovered in 1759 that mercury was really a metal, it also became known that it deserved to be classed with the noble metals, gold, silver and platinum, because like them, it does not in melting oxidize. It is malleable when solid, and when by any means it is oxidized, it returns to the metallic state by simple heating alone.

The physical properties of mercury were but little known a few centuries ago. The following is a quaint description of mercury and its properties, quoted from "Pammineralogicon," or "An Universal History of Minerals," by Robert Lovell, Oxford, 1661.

"Place in Spain, Hungary (so the best) and in other places.

"Matter—of much earthy matter and water. Name—Arab—'zaibar'—Barb—'azock.'

"The best is that that lieth in mines neere gold or silver and has the least of arsenical, antimonial, saturnine or cadmiose commixture, and leaves no excrement in the retort, or leaves a yellow or white spot and not dimme or black, being evaporated in a silver spoon.

"It is very cold and moist. It is to be kept in glazen vessels. It consumeth all other matter except glazed vessels. All things swimme therein except gold, which it attracts and purifieth. It serveth to guild with, being mixed with gold, so laid on and put to the fire which disperses the quicksilver, and it may after be separated with aqua fortis."

Cronstedt, one of the earliest writers on modern mineralogy, "System of Mineralogy, 1772," thus gives the views held at that period in relation to the physical properties of mercury:

"The divisibility of quicksilver in the cold might occasion some doubt, whether it really deserved to be called a metal if it had not a right to it from the earliest times, being then recorded among the metals when even they were named after the planets, the number of both being thought equal.

"The opinion that has long time prevailed that the quicksilver is a necessary ingredient and constituent part of all metals is not so generally received now as heretofore, since those processes which have been advanced as proofs of it, and which have, however, but seldom been repeated, do by no means succeed, at least not in all places.

"It is rather supposed that by the mercurial earth the ancients have understood an earth which may by addition of phlogiston be reduced in the fire to a metallic state, and this appears to be so much the more reasonable as quicksilver only attracts the metals in their substances and not in their burnt calces."

Robert Boyle, "Physiological Essays," 1666, Fol. 193:

"And though Quick-silver be, excepting Gold, the heaviest known body in the world, yet when it is reduc'd into vapour it seems to be carried to and fro like other terrestrial particles that swim up and down in our air, for I remember that an expert Gilder not long since complained to me that if, when he evaporated Quick-silver, he forgot to take off Rings from his hand, though they touch'd not the Quick-silver whilst it was in a body, the roving fumes would oftentimes fasten upon the Gold in such plenty as would put him to much trouble to get them off from his Rings, one of which he showed me that he had lately thus whitened, and as it were silvered over with Mercurial fumes and was then to restore to its native Yellow."

Cramer, 1764, "Quick-silver *Mercurious*, though it has no other metallick Quality but its Ponderousness, yet is almost universally reckoned as a seventh Metal. It loses 1-14 Part of its Weight in Water. When pure it is ever fluid, even in the coldest Weather, and of course not malleable. It has the brightness of Silver and it is of the utmost Opacity; being resolved into Fumes by a middling Fire, it evaporates entirely, a few reddish Grains like Sand excepted. These Vapours, however, being collected return into the same Mercury as before."

"Museum Calceolarianum Veronense," by Andrea Chiocco, Verona, 1622 (translation). "The nature of quicksilver appears clearly wonderful, for all other metals placed upon it float, gold excepted. Its nature is light, for by Aristotle, Book IV, it is classed among those that have 'the most lightness,' for it easily flies away in smoke, from this property of exhaling readily. Therefore they enumerate it among the spirits of chemistry.

"Only gold destroys this poison, for when it has first touched it, it permeates it within, breaks it and turns it into dust, emerging itself at last with no character of gold; yet this rises more beautiful from the fire than it was before.

"Scaliger teaches that the substance of quicksilver may be easily understood by the example of water, which when it falls upon dust forms into little globules with the dry material, for it encourages companionship because it gives it the firmness which it has itself. Therefore quicksilver has the same relation in nature that water has in collected dust for it is earthy water, or watery earth, not without much air. Hence it plainly confutes Cardanus who wished quicksilver to form globules with dry dust, because, escaping the contact of the dry earth, it tries to concrete by permeating it, and since it forms into globules in water and in lead filings, which it does not avoid, leaving it unwillingly and taking from it as much as it can.

"Gabriel Fallopius, skilled in many experiments and of most acute talent, teaches in many ways that quicksilver is hot and dry; that there are two things in it—air indeed, but in small quantity, yet as much as will eliminate the earthy substance; the other is earth in great amount, so that out of 100 parts 80 are earth and the rest air.

"On that account if hydrargyrum is touched, it does not leave the hand moist, nor the place which it touched. Although affected by the air, it is not destroyed by it. On account of the large proportion of earth they thought, indeed, this would happen, which Fallopius disproved, since it is easily dissolved by the sun and by fire, which is small proof of the mixture. It is therefore on account of the small quantity of air that it does not moisten things. Neither is the earth which dominates in quicksilver pure and crude, but sooty, baked and exceedingly attenuated, so that enduring heat with difficulty it flies away in smoke, which would not happen to crude earth. On account of this sooty earth, also, it easily rises, not by reason of the air, which this author plainly shows."

Congelation of Mercury.

The discovery of the fact that mercury, like other metals, can be brought to a solid state by subjecting it to a sufficiently low temperature, was accidental.

A brief history of this remarkable discovery and of a series of experiments made at various times and at sundry localities, compiled in part from a very full paper on this subject by Dr. Charles Blagden, and published in the Philosophical Transactions for the year 1783, Folio 73, may be given as follows:

Prof. J. G. Gmelin was sent with a party of scientists, by the Russian Government, to explore the territory of that nation in Europe and Asia. The expedition left St. Petersburg in the summer of 1733 and remained absent for ten years. During the winter of 1734–5, while stationed at Yeniseisk in Siberia, on the great river Yenesei, in Latitude 58 30 and Longitude 92 east, the weather became exceedingly cold. Mercury actually froze and sank out of sight in his thermometer. When the metal refused to move in the tubes, although he recorded the fact, he attributed the phenomenon to the vinegar and salt with which the mercury had been cleaned, and never suspected it was congealed. When the thermometer fell to –120 he did not know that below –40 the excess was due to the contraction of the frozen metal.

In the winter of 1736–7 while at Yakutsk on the river Lena, in Siberia, Lat. 62 N., Long. 130 E., De Lisle, a member of the Scientific Corps, informed Prof. Gmelin that the mercury in his barometer was frozen. De Lisle was probably the first man who ever looked on mercury in a solid state. The phenomenon was attributed to the same cause. Prof. Gmelin entered the fact in his record and mentioned that he tried to force the obstruction down with a wire.

In 1759, J. A. Braun was Professor of Philosophy at the Imperial Academy of St. Petersburg. Dr. Zeiher, also a professor in the same institution, who, in another country, had experimented with freezing mixtures and knowing the excessive cold of the Russian capital would greatly facilitate such experiments, proposed to Prof. Braun to continue the work; he being an invalid, but neither had any idea of congealing mercury, but only of ascertaining how low a temperature could be obtained by artificial means.

On the 14th day of December, 1759, the thermometer standing in the open air at –34 degrees Fah., Prof. Braun prepared a mixture of nitric acid and pounded ice, by which he reduced the temperature to –69. The mercury in his tube was frozen, but he did not notice it at first. In a second experiment he substituted snow for pounded ice, and was astonished to find the instrument to indicate –100, –244, –352, successively. Removing the bulb, he found the mercury immovable, and it remained so for 12 minutes in the cold air. Still not realizing that the metal was solid, he repeated his experiments with other mixtures and obtained the same result. It then dawned upon his mind that the metal was frozen. Relating his experience to the Academy, Prof. Aepinus was requested to join him in another trial, with similar results. They broke the bulb of the thermometer and obtained a ball of solid, lustrous mercury, a sight never before beheld by man. It was slightly harder than lead, and so malleable that it was considerably flattened by blows from a pestle in a common mortar.

Prof. Aepinus at the same time experimented with glass vessels like modern test tubes, in which he easily froze mercury which cooled with a concave surface, and the ingots obtained sank in fluid mercury. It will be seen that this discovery was purely accidental, for had Prof. Braun used spirit thermometers in his experiment, the world might long have remained in ignorance of this singular fact.

During the winter following, Prof. Braun repeated his experiments, but did not discover his error in supposing that so low a temperature was required. He published the results of his experiments in 1767 and died in the following year.

In 1772, at Krasnoiarsk, a Siberian town on the river Yenesei, Lat. 56.30 N., Long. 93 E., Dr. P. S. Pallas, a celebrated Prussian naturalist, who, by his discoveries in Siberia laid the foundation for modern geology, then in the employ of the Russian Government, caused mercury to freeze by exposing it to the natural winter cold of that rigorous climate. On the 6th and 7th of December, the weather being extremely cold, mercury froze in his thermometer. He exposed three-fourths of a pound of mercury in a bowl in the open air; in an hour the edges were congealed. Soon after the surface froze over and the metal became a solid mass, more flexible than lead, and when hammered out thin seemed somewhat granular. If the hammer was not perfectly cooled a portion of the mercury separated in drops. In a warm room it gradually melted like wax on a fire. When broken to pieces while granular the fragments adhered to each other and to the bowl. When touched, the metal melted but the fingers were benumbed. This seems to have been the first instance where a considerable mass of solid mercury was handled and closely examined.

In 1774 Mr. Blumenbach, a student in Gottengen, placed mercury in a frigorific mixture on a cold night, the temperature being –10 Fah. He obtained solid metal in irregular fragments, of a bluish-white lusterless color like zinc. Scientific men of that period thought it was crystalline or only partly congealed.

In 1775, at Albany Fort, on the shores of Hudson's bay, Lat. 52.14 N., Long. 82 W., Thos. Hutchins, Governor of the fort, made a series of experiments with mercury at a low temperature. On the 19th of January, the temperature being –37, he repeated the experiments of Prof. Braun, using nitric acid and snow. The quicksilver in the thermometer was frozen, the glass broken, and the mercury bullet flattened under the hammer with a dull sound like lead. When the bullet fell six inches it was visibly flattened. It was lustrous and finely polished on the surface. An account of these experiments may be found in Volume 66, Philosophical Transactions, 1776, Fol. 174. This work is in the Mechanics' Library in San Francisco.

In the year 1780, January 4th, the cold at Vytegra, a town in Russia lying in Lat. 61 N. and Long. 36 E., being 34 degrees Fahr., M. Von Elterlein exposed during the night three ounces of mercury in a china cup, covered with paper pierced with holes. The next morning the metal was solid and looked like a piece of cast lead with a considerable depression in the middle. In attempting to remove it from the cup, the knife raised shavings as if it had been lead. He succeeded in removing the mass, and took it in his hands to try if it could be bent or broken. It was like stiff glue and broke into granular fragments. His fingers lost all feeling and it required an hour and a half rubbing with snow to restore circulation. At eight o'clock, the thermometer standing at –40 degrees, the fragments resembled amalgam. When the temperature became –39, the metal was fluid.

In the winter of 1781–82, at Albany Fort, Hudson's Bay, Governor Hutchins, by request of the Royal Society of England, repeated his experiments of 1775 with great care. The result he sought and obtained was the determination of the temperature at which mercury became solid. He selected the coldest nights, and keeping the thermometers, apparatus and chemicals at the low natural temperature, mixed snow and nitric acid, already very cold, and immersed the bulbs. The result showed that 40 degrees below zero of Fahrenheit was the point at which the metal congealed, and it could be cooled down several degrees below while at rest, but if disturbed it froze and immediately rose to –40 degrees. In one experiment the temperature fell to –79 degrees, the metal still remaining liquid. Mercury contracts very much when in a solid state, calculated to be one twenty-third part of its volume, and this shrinkage was in earlier experiments mistaken for a much lower temperature.

No mercurial thermometer can therefore correctly indicate a temperature below –40 degrees. The solid metal obtained was bright and lustrous as when liquid. It was hammered out roughly and found to be quite malleable.

January 26, 1782, the thermometer standing at –40, he succeeded in obtaining solid metal in the open air without artificial aid. In a two-ounce vial tightly corked, he put ½ mercury and exposed it to the natural cold; although it froze, the metal was granular or crypto-crystalline. When hammered, it crumbled like a badly melted ingot of any other metal. Before these experiments were made it was generally believed by scientists that mercury could only be crystallized at a temperature below that actually required. Some set the figure at from 500 to 600 below zero; but few thought it possible below –100. A full account of these experiments may be found in Vol. 73, Philosophical Transactions for the year 1783, Fol. 303.

Mr. William Coxe, an English historian, traveler and author, in 1784–5 witnessed in St. Petersburg experiments made by Dr. Guthrie, physician to the Imperial Corps of Cadets; the results did not differ materially from those obtained by Professor Braun and Governor Hutchins.

December 22, 1784, during a cold, clear evening, the thermometer (Reaumur's) indicating 17 degrees below zero, he exposed pure mercury and an amalgam of tin, and proved the freezing point to be 32 degrees below zero.

January 9 and 10, 1785, Dr. Guthrie experimented in the presence of Mr. Coxe, Prof. Pallas and others. Mr. Coxe quotes Prof. Laxman to the effect that in Siberia, in 1702, mercury remained solid in the open air for two

months together. An account of these interesting experiments may be found in "Coxe's Travels in Northern Europe," London, 1802, reprinted in Pinkerton's Voyages and Travels, 1812, Vol. 6, Fol. 690.

Mr. Walker, an apothecary at Oxford, England, on the 2d day of April, 1787, congealed mercury by the use of frigorific mixtures. The apparatus consisted of four pans diminishing in size, one within another. The mixtures were placed in each in such a manner that the outer cooled the inner. The materials used were nitric acid, sulphate of soda and nitrate of ammonium.

In Vol. 3, Fol. 76 of the Philosophical Magazine, published in London in February, 1799, a copy of which is in the Mercantile library of this city, may be found a communication from W. H. Pepys, an English chemist and philosopher, describing his success in congealing 56 pounds of mercury at one operation. The apparatus used is also figured. On the 30th day of January, 1799, the temperature of the laboratory being 40 degrees F., he obtained snow for the experiment. He placed in an earthen pan equal parts of muriate of lime having a temperature of 40 degrees, and snow at 32 degrees; they became liquid, but acquired a temperature of 32 degrees below zero. In this mixture he immersed other vessels of snow and muriate of lime, the temperature of which was reduced by this means five degrees. These, mixed, produced cold indicated by 50 degrees below zero; a small retort containing four ounces of mercury was introduced into the latter mixture and the metal became solid in 15 minutes. It congealed from the outer edges inwardly like cooling wax. He broke the retort and struck the metal repeated blows with the hammer; the first indented it somewhat, but it yielded to the last and broke like zinc. He thoughtlessly picked up one of the fragments, and immediately experienced a sensation as if wounded by a sharp instrument; his hand was bloodless and dead to all appearance. The mercury in the meantime became fluid. The experiment was repeated, but the metal was introduced in a small glass tube. It became fixed in two minutes. The tube was broken and the metal bent at an acute angle with a pair of pincers. An attempt was made to straighten it, but the mercury liquefied.

Feb. 28th of the same year 56 pounds of mercury were put into a strong bladder, placed in portions of the freezing mixtures successively, by which the temperature of the mass was gradually lowered. In an hour and 40 minutes it became solid, and the temperature was found to be 46 degrees below zero. The mass was granular like hard amalgam, more than a solid metal. In lifting it from the frigorific mixture it broke into several pieces. A number of persons in the room took pieces in their hands and suffered much in consequence.

Dr. Henry, in his "Elements of Experimental Chemistry," 1814, describes and figures an apparatus in which mercury can be frozen by muriate of lime and snow. The metal is first reduced to a low temperature by another freezing mixture.

In 1875, January 8th, in Montana, the spirit thermometer fell to 35 degrees below zero. Mercury was placed in a tumbler and exposed; at 9·40 P. M., the same thermometer falling to –41 degrees, the metal was frozen. It was carried in this condition into a store and examined by a number of persons.

In 1876, at the Eureka Mill on the Carson river in Nevada, the weather became very cold, and it was found that the mercury pumps did not work. On examining the tanks it was found that the quicksilver was solid. It was cut into cakes with a shovel and carried up to the pans above, at least it is so stated in the MINING AND SCIENTIFIC PRESS, Vol. 32, Fol. 98; but it is the opinion of the writer that there must be some misstatement.

Chemical Properties.

Mercury is insoluble in hydrochloric acid, but yields to nitric acid and forms salts which are those of the suboxide if the acid be cold and dilute, and of the oxide if applied concentrated and boiling. All the salts of mercury and the metal are volatile; some unchanged, others being decomposed.

The salts of the suboxide in solution behave as follows with reagents:

Hydrosulphuric acid or sulphide of ammonium throw down black sulphide of mercury insoluble in dilute acid, sulphide of ammonium or cyanide of potassium.

Soda or potassa cause black precipitates of suboxide of mercury, insoluble in an excess of the reagent.

Hydrochloric acid or solution of soluble chlorides precipitate white subchloride of mercury.

Protochloride of tin precipitates metallic mercury as a gray powder; by boiling and careful manipulation the metal may be collected into one globule.

A bright surface of copper precipitates metallic mercury from a neutral or slightly acid solution of a suboxide salt. The best way to obtain this reaction is to place a drop of the solution on the horizontal surface of the copper, and after a time rubbing it with a piece of rag or filtering paper.

In solutions containing salts of the oxide, hydro sulphuric acid or sulphide of ammonium (in small quantity) throw down a perfectly white precipitate, while an excess of the reagent yields a black precipitate of the sulphide which is soluble in sulphide of potassium. These reactions are characteristic of mercury.

The sulphate and nitrate are decomposed by water in large quantity.

Mercury as a Medicine and as a Poison.

It is a curious fact that no matter how poisonous a substance may be, or how deleterious its effects, physicians begin to experiment with it, and prescribe it as a medicine as soon as known. Even the Woorari, the most deadly of poisons, is not an exception. If the Upas has not been so tried, it must be owing to the difficulty of procuring it.

The Romans, well acquainted with the toxic properties of mercury, considered it the base or cause of all poisons (*venenum rerum omnium*), but as drugs they used no other mercury compound than cinnabar, with which they prepared liniments for rubbing on the stomach and head.

The Arabian physicians and alchemists were familiar with mercury. Rhazes, about 930, who first studied smallpox, used it medicinally but externally, against vermin and cutaneous diseases. But Paracelsus was first to employ it internally.

Theodoric, an Italian surgeon and friar, who died in 1296, recommended the use of mercury as a medicine in some diseases.

Juan Almenar, a Spanish physician, early in the tenth century, in a medical work of which he was the author, advised the use of mercury in "Lues Venerea."

Metallic mercury taken into the stomach produces no injurious effects; it has, in some cases, been used mechanically to remove some obstruction in the bowels. But it is a question if the introduction of a pound or more of quicksilver for that purpose is judicious or safe.

The salts of mercury are all poisonous, some much more so than others. Yet in a proper form and in suitable doses, it is considered a valuable and in some cases an indispensable medicine.

It is generally used internally in the form of Blue Pill or Calomel, described elsewhere, sometimes externally as mercurial ointment, or in the form of a lotion. Half a century ago it was more extensively employed than now, and with pernicious effects on humanity. It is thought by some that mercurial diseases following its use were far more injurious than the diseases it was employed to cure.

The symptoms of mercury poisoning, hydrargyrosis, salivation or ptyalism are first a metallic taste in the mouth and a soreness of the gums. When the teeth are tightly closed, a sense of looseness is felt. This is soon followed by a swelling of the gums. The breath has a peculiar and very disagreeable odor called the "mercurial fetor." The saliva flows excessively, and in extreme cases the gums, tongue, throat, and face swell. The tongue is covered with a thick white coating; ulcers form; the saliva literally flows from the mouth in streams, and unless relief is obtained, great debility and death follow.

Artificers who use mercury, for example, firegilders, mirror manufacturers, miners and millmen, and especially quicksilver miners, long exposed to mercurial vapors, are frequently afflicted with shaking palsy and other forms of mercurial disease.

It is not necessary to take mercury into the stomach to produce poisoning, but the skin, the mucous membrane, and the lungs absorb by long exposure the vapors of this metal and become diseased, the malady extending to other parts of the body. The bones are affected and begin to decay; the first step is periostitis, followed by caries.

The effect on the skin is to produce perspiration, followed by eruptions and ulceration. The poisonous effects of mercury are sometimes accompanied by other alarming symptoms, as ozena, irilis, neuralgia, rheumatism, gout, loss of the hair, swelling of the glands, swelling and induration of the liver, trembling of the limbs and paralysis.

When the magnitude of quicksilver mining and metallurgical operations in California and the use of mercury in our gold and silver mines are considered, instances of salivation are very rare. This must be attributed to the superior skill and intelligence of those so engaged and to the perfection of mining, the result of evolution which has made the California miner the best the world has ever produced. This is no empty boast.

Quicksilver miners suffered more in California from the effects of mercury in former days than now, if we are to accept the statements of earlier authors. Bartlett, 1855, wrote as follows: "Those who work in the mine (New Almaden) were uninjured, but salivation was too common at the works; the men were relieved every three or four weeks; horses and mules were salivated; 20 or 30 die every year from the effect of the mercury. Seven or eight days were required to fill the furnaces and extract the refuse, the latter being the most dangerous operation, but it was done as much as possible in the open air. The furnaces were covered with a roof, but otherwise were open."

A gentleman, formerly superintendent of the St. John quicksilver mine in Solano county, California, informed the writer that on one occasion, it being required to make an examination of the interior of the furnace and being too considerate to expose his men to danger, he entered himself and in consequence was badly salivated.

Metallic poisoning among miners and workmen in quicksilver was very common a century or more ago. Instances of mercurial poisoning are often met with in the books of that period. Valmont de Bomare, 1775, wrote as follows: "All authors agree that the Indians and those who take the fluid mineral from the mines do not live long, and that they become paralytic and consumptive, which they attribute to the effects of the mercurial vapors on the nervous system. It is said that only condemned criminals work in this sort of mine. The reduction works where they distil the mercury at Idria are some distance from the mines; they give off a very disagreeable smell; animals dislike to graze near them, and the workmen are relieved every month; the turn of each workman comes but once in a year. Those who work underground in extracting virgin mercury are changed every fortnight. They go up and work the mineral in the free air. This prolongs their lives a little. Those who have seen these workmen say that their sweat looks almost like tears of mercury; they relate of Idria that those employed in that mine are willing workmen, and are sick but little; they are relieved every few days."

A singular case is cited by an old writer who visited the quicksilver mines of Friula (Idria) in 1664. Description of the Idria Mines by Walter Pope, Phil. Trans. Vol. 1, 1665.

"The laborers work for a julio per day, which is not above six or seven pence, and endure not long, for although none stay underground above six hours, all of them in time (some later, some sooner) become paralitick and die hectick. We saw there a man who had not been in the mines above half a year, so full of mercury that putting a piece of brass in his mouth and rubbing it with his fingers it immediately became white like silver; I mean he did the same effect as if he had rubbed mercury on it, and so paralitick that he could not with both hands carry a glass half-full of wine to his mouth without spilling it, though he loved it too well to throw it away. I have been since informed that here in Venice those that work on the back side of looking-glasses are also very subject to palsey. I did not observe that they had black teeth; it may be, therefore, that we accuse mercury unjustly for spoiling the teeth when given in venerial diseases. I confess I did not think of it upon the place, but black teeth being very rare in this country, I think I could not but have remarked it had all theirs been so."

This account reads as if there were some deception practiced, or that facts are misstated.

When the amalgamation of silver ores was introduced into South America, mercury was sent out from Spain to supply the miners. In those days there were no iron flasks, the quicksilver was tied up in bags and stowed in the hold of the vessels carrying it. Sometimes during heavy weather the bags got adrift and some of the metal escaped. When passing through the tropics on the long passages, the mercurial vapors sometimes produced disease among the passengers and seamen. With this experience, when, as was frequently the case, the ships were captured by buccaneers, the sailors of the captured ships went below and cut the bags of quicksilver in the cargo, and protecting themselves by remaining on deck until the captors became salivated and broken down in health, conquered them and recaptured the vessels. This fact or fiction has been frequently written in old histories and romances.

The following extracts from Lovell's "Pamineralogicon" show that mercury was largely used as a medicine in his time, and that he was well aware of its poisonous properties:

"It looseneth the teeth. The Water whitens the face. The sublimat in three hours corrodes the body.

"The use of crude mercurie is both inwardly and outwardly, seldom inwardly, and then in pills. Outwardly in unguents in which it showeth not itself; and in plaisters for the itch to be applied to the joints, but it's carefully to be used for being anywhere applied it causeth putrifaction by salivation.

"Being taken in too great a quantity it breaketh the intrails by its weight.

"Waters running by mercurie if drunk, is carried to the head and thence falls to the gummes hurting them, and the limbes as appears by the ointment of quicksilver.

"The common mercurius dulcis doth gently purge forth all noxious humors without trouble insomuch that it may be given to infants.

"Mercurie precipitate per se, doth strongly cause sweating, and given 6 or 7 times doth eradicate the French disease" (syphilis).

"Fixed mercurie panacea doth dry up all noxious humors and as a diaphoretical, expelleth the same. The solar precipitate doth mightily cleans the bloud and the whole body from the French disease."

In an article on mercury and its application to medicine, on 7 octavo page, this author makes mention of the following mercurial medicinal preparations:

1. Aqua Aluminis Fallop. 2. Aquila alba. 3. Aquala caelestis. 4. Arcanum corallinum. 5. Aurum vitaea. 6. Common precipitate. 7. Compound coralline arcanum. 8. Crude mercury. 9. Draco mitigatus. 10. Fixed mercury panacaea. 11. Incarnate precipitate. 12. Jovial bezoardick. 13. Jovial liquor. 14. Liquor gummosus. 15. Liquor of mercure. 16. Lunar bezoardick. 17. Manna mercurii. 18. Mercurius corallatus. 19. Mercurius dulcis. 20. Mercurial laxative. 21. Mercurie of life, corrected. 22. Mercurial oil of Antimonie. 23. Mercurie precipitate per filices. 24. Mercurie per se. 25. Mercury precipitate per se. 26. Mercurie precipitated by oile of sulphur. 27. Mercurie precipitated by tincture of smiris. 28. Mercurie precipitated by water of egges. 29 Mercurius vitaea. 30. Minerall bezoardick. 31. Minerala laxitive. 32. Oyle of mercurie antimoniate. 33. Pulvis angelicus. 34. Purging panacaea of mercurie. 35. Solar precipitate.

The Plumas Eureka Mine.

EDITORS PRESS:—By courtesy of Sup't Hoskins we were shown through the works by Mr. Johns, who is acting assayer, amalgamator and silverplater for this great mine.

They are now running 60 stamps in a mill whose heavy timbers, thorough bracing, substantial machinery, labor-saving devices, as well as elaborate plant for saving gold, convey the impression of thorough practical knowledge backed by plenty of capital. Besides a good water-power they have fine large boilers, supplying steam to a heavy engine and a large air-compressor. The engine alone runs 40 stamps when needed.

Knight's Water-Wheel

Has been in use many years with great satisfaction in places where water has heavy pressure. The design is much like the Pelton wheel, advertised in the PRESS. Mr. Johns said that a wheel that had been in use eight years, when broken by carelessness and removed, showed no signs of wear. They also use Knight's water engines for pumping in the mines. Mr. Johns speaks highly of Hendy's ore-feeder, and also of the Blake crusher, which greatly amused us by the apparent ease with which it crushed the hardest quartz. At one side of the mill were piled cords and cords of cast-steel shoes and dies. It looked as though they must have imported them by the shipload.

Comfort of the Men.

The devices for drying miners' clothes and toilet conveniences, also the rooms for the brass band, as well as school and church facilities, carry the idea that big-hearted men are at the helm here. This was confirmed by the complaints of the saloon-keepers that the town was no good at all. One of them said that instead of miners coming in to have a good time every Sunday and give business-men a chance, as they did at other places where he had been, you would see the superintendents starting off for church every Sunday morning and a long string of men following them. He did not understand how high a compliment he was paying. Farmers don't know what they should do without the Johnsville market. Saloon-men say they will have to move away. The Plumas *National* will soon have an elaborate article from data furnished by the management of the mine, and for that reason we dismiss the subject with a much less extended notice than its importance would warrant.

We were surprised to see seven or eight arastras running away down below the mill, and to learn that Italians were paying some royalty and still making a living from the tailings of this mill, where all modern gold-saving devices seem to be used to best advantage.

F. S. C.

A POWDER COMPACT.—The California Powder Co., Giant Powder Co., Vigorit Powder Co. and Safety Nitro Powder Co. have formed a compact to last five years, and the percentages are as follows: California Powder Co., 37½; Giant Powder Co., 37; Safety Nitro, 16; and the California Vigorit, 9½. The price of powder to the trade has been established by the combination as follows: Forty per cent powder, 18 cents per pound net in carload lots and 20 cents per pound for less than carload lots; 50 per cent powder, 23 cents for carloads and 25 cents for less; 70 per cent powder, 28 cents for carloads and 30 cents for less; 30 per cent powder, 15½ cents for carloads, 17½ cents for less. This is an average advance of about five cents per pound over the previous rates. The local combine is also associated with all the Eastern and Western companies in the United States, and also with all the dynamite-manufacturing companies in Europe, regulating the prices of all foreign trade.

THE steamship City of New York was laid up about two weeks ago, and is now at the Union Iron Works undergoing repairs which are to be so extensive as to detain her in port fully three months. Her boilers are to be taken out and new ones put in. She will be thoroughly overhauled and refitted throughout. The saloons and staterooms are to be refurnished and newly upholstered. She will be cleaned and painted within and without, and lighted up above and below with incandescent electric lights.

HEREAFTER any one so desiring can deposit gold coin at the Sub-Treasury in $5000 or $10,000 sums and receive therefor a gold certificate drawn to his order. These certificates will be payable on demand when presented at the office with the indorsement of the person to whom they were issued originally.

THE attorneys for the Bulwer Con. Company of Bodie have made application for a new trial, the management being dissatisfied with the damages of $3000 awarded in the suit with the Standard.

A PROSPECTOR named Long left Elko, Nev., some weeks ago to search for the famous Lost mine. Last week his dead body was found on the Honey Lake road, two miles from Granite Station.

NINETEEN live sea-lions have been taken to Chicago from this coast.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BUNKER HILL.—*Ledger*, Aug. 17: The Bunker Hill has again started full blast, a sufficient quantity of water flowing in the ditch. The Keystone is dropping her 40 stamps again, 20 of which were closed down for lack of water. The South Spring Hill on the arrival of the water put on their full force and the mill worked to its full capacity.

SUTTER CREEK.—The extra 10 stamps of the Wildman mill were started last Monday. It required an hour or so to adjust the feeders, etc., after which everything moved along like clockwork. The entire mill is lighted with electricity, even the amalgamating room. It presents a very striking and attractive appearance after nightfall. The new Triumph concentrators are running all right, but the test referred to will not be tried for about a month, as it will require that time to fill all crevices in the batteries and even to get the concentrators in good working shape. The compressor is not put in the mine yet on account of the rush of work at Knight's foundry, but it is expected to be at work by the first of next month. The superintendent, Mr. Tregloan, has given everything his closest personal attention and it is easily to be seen that economy is made one of the principal features of the management. The mill has been painted red on the outside and is having a thorough coating of white on the inside, which will save at least half an hour's lighting every day.

Butte.
